The meaning of the term 'existential human being' may initially be summed up in the phrase: Man is, and he is a thinking and acting being, where 'thinking' itself constitutes and is a part of the 'acting'. Thus conceived, the term 'existential human being' is, however, merely a combination of the Sartrean concepts of the 'being-in-itself' and the 'being-for-itself'. Our conception, therefore, needs to be clarified more fully. In this conception, the existential human being is not merely a thinking and acting being, but a being who 'thinks' and 'acts' for one or both of the following two purposes: (1) preservation of his being-in-itself; and (ii) a meaningful preservation of his being-in-itself, where the 'meaningful' is defined by the subject himself. Presented thus, our conception differs from that of Sartre whose subject is concerned with a meaningful existence—through an exercise of his 'choice'—rather than with a meaningful preservation of his being. A Sartrean subject will not flinch from dying in pursuit of a meaning for his existence. Thus the act of dying itself—in pursuit of meaning—will embody for such a subject the meaning he was looking for. For us, a subject may come to sacrifice his being-in-itself but will do so either in the pursuit of or in the absence of a possibility of a meaningful preservation of his being-in-itself. More commonly, he will become willing to sacrifice only his being-*for*-itself, that is, his thinking and acting being, for a preservation of his being-in-itself. Our subject, thus, has no 'choice'. It is also clear that it is not merely 'thinking' and 'acting' that make our subject political, but also 'not thinking' and 'not acting' which he may do out of compulsion.

The 'existential setting', what we would now call the existential world, combines in itself two sub-settings: one, what we would call the 'world of nature'; and, two, the 'world of man', where the world of man is a part of the world of nature. It is this setting which forces man to become a being-for-itself from a mere being-in-itself. In other words, this setting itself consists of beings who are thinking and acting beings, that is, beings who are, so to say, 'beings-for-themselves'.

It only remains to add the following. Firstly, in this conception of the existential world the political arena, what we would now call the political world, forms part of both the world of nature and the world of man. Secondly, the human subject acts in the political world not merely as a political being, where by 'political being' is understood a being pursuing his narrowly defined political interests, but as an existential being. Thirdly, the political world partly includes within itself what we may call a subject's economic and social worlds. However, whereas his activities in the economic world are directed specifically at and are a pre-condition of a preservation of his being-in-itself, those in the social world aim at and assist in preserving a subject's (both) the being-in-itself and the being-for-itself. A combination of all these worlds, the economic, the social and the political, constitutes what we would call, following Habermas, a subject's life world. However, as is clear, our conception of the life world differs from that of Habermas, for whom life world is what he calls the world of consensual communicative action. In our conception, life world is characterised by what Habermas would call purposive-instrumental action, which is the opposite of consensual communicative action. Finally, the political world, for us, is purely the world of dialogue, a dialogical world, where the dialogue includes but is not confined to merely verbal communication.

In this sense, all dialogical activities within the social and economic worlds, too, form part of the world of politics. But what are dialogical activities? These are the activities which involve the pursuit of power, the stuff of which politics is made.

III

One aim of this essay would be to modify and/or extend, in the light of the discussion it leads one into, the conception of the existential or life world outlined above. Another would be to tentatively discuss the possibility of attaining a nondialogical, that is, a nonpolitical existence in a world that apparently seems to totally rule out such a possibility.

Theory has suggested mainly four ways of attaining this latter end, or, what amounts to the same thing, of resolving this problematic. One, appropriate the alienating other. This has been a dominant theme of most western theory, especially since the enlightenment. Two, negate the other, as in certain of the eastern traditions. Three, make pact with the other, advocated most recently by Jurgen Habermas. And, four, annihilate the self, that is, the alienated subject, thereby bringing to a conclusion the very struggle for the realisation of a nondialogical existence. Elements of this suggestion are visible in Schopenhauer, Camus and Dostoevsky.

We will contend, through an implicit dialogue with the existing theory (and 'dialogue' here has the same connotation as underlined in the framework above, for the author sees the present exercise as part of his struggle for existence), that the four suggested ways cannot resolve the problematic due to their inner limitations: (1) The subject may not be able to appropriate the other because the other is a multiplicit and multiplying subject. (2) The subject cannot negate the other since negation presupposes a continuing recognition of the other which implies a continuing confrontation with it. (3) The subject may make pact with the other; however, some-what like in (2), it would mean a persistence of the dialogue. Finally (4), the problematic is not resolved by an annihilation of the self; by this act the subject moves out of the dialogical world—leaving it intact—having paid the highest cost for this exit, his very existence.

There is another, a fifth, clue to a solution to this problem, articulated most clearly in Jean-François Lyotard who talks of the 'atomisation' or dispersal of the other through the strategy of 'critique', that is, a rhetorical (meaning real, concrete) 'language game'. Although Lyotard advances this view in opposition to the discourse of enlightenment and his theory is in itself a 'critique' of the enlightenment project, atomisation or dispersal is just another word for appropriation, and therefore this suggestion falls in the same category as the one mentioned at (1) above

One may mention one more, a sixth, suggested method to end this conflict: 'love' or identify with the other. This suggestion is found mainly in the moral-religious discourse but also in some ethico-political thought, such as of Gandhi. We have brought up this suggestion as one of the peripheral ones as it rests on a totally different plane of logic than ours. It remains none the less the most powerful one. The source of both its logical distinctness and its power is the questioning implied in it of the very concept of the 'other': it is grounded in the notion of essential 'oneness' of the subjects including the nonhuman ones. This not only puts it in an altogether different analytical category but also for the same reason makes it the most difficult to examine. By challenging the most basic premise of our understanding of the world, it compels us to abandon that premise for the moment and confront it on a different ground.

Without vacating our own ground the question that we could have asked of it is: If I am one with all the other subjects, wherefore then the need for me to love them or identify with them? But obviously this is the question that we cannot ask, for the answer from the other logic would be: "You should love them *because* you are one with them." An alternative that we have is to point out what appears to be an anomaly within this logic. And that anomaly is: it uses the notion of 'love' which should apparently belong only to *our* logic to construct a view of a totally different logical order—"You should love them because you are one with them"—forgetting that love, in our logic, presupposes otherness, that it embodies a need and therefore a desire for oneness.

If we resort to this alternative, however we can ourselves be accused of taking concepts from one order of logic and projecting them onto another without regard to their possibly different meaning in the latter. What we need to do, first, therefore is to try to discover the meaning of the terms 'love' and 'oneness' in this *other* logical order we are talking of. One thing that is clear is that love in this order does not presuppose otherness, nor does oneness imply here the absence of the need for love. In fact, love presupposes here precisely the opposite of otherness—oneness; and implied in oneness is precisely the need for love. In other words, while there is oneness here, this is a oneness which has a void within itself and this void can be filled with love. At the same time, the nature of the love that would fill this void is such that the need for it would not cease to exist even after the void has once been filled—the oneness being a given and a permanent entity devoid of love. It is this given and permanent need for love, love that is to be brought to one another by the subjects-become-one, that makes their existence—for, being one they have no *relationship*—a dialogical one, for this need signifies an absence, which in turn signifies a struggle to fill it. Admittedly, the dialogicality of *this* existence is of different order, and hence the nature of the efforts to end it and the route to this end too would be different, but that is not the point we were trying to discover here.

IV

Does that mean that the human subject is condemned to live a dialogical existence? While the answer to this question appears at this point to be yes, and while most available theory tacitly concurs with this conclusion, far from bringing the discussion to an end, it only lays the ground for its further opening up and in more directions than one. For, not only is the human subject an existential being, as we have projected him so far, he is also for this very reason an *imagining* subject. And the richer and more complex is the world of his existence, and therefore the intenser and more complex is his struggle for existence, the richer and more complex is likely to be what we would call the world of his imagination.

But what is the significance of our introducing this world at this point of the discussion? One significance obviously is that it gives us an opportunity to allege that political theory has so far nearly totally neglected this what in our view has been and is increasingly becoming one of the more important areas of man's existence. Only recently have some attempts been made to take conscious notice of the significance of man's imagination for the political world he may want to build around himself. However, what makes inadequate the attempts like these is that they take notice mainly of the 'collective' imagination of the human subjects. While the concept of collective imagination is in itself of a controversial nature and should, for that reason, be taken up for discussion, what is more imperative here is to advance a proposition which will form the basis of a necessary component of the discussion to follow. This proposition is: It is not merely that man's imagination, or the world of his imagination, is an important sphere of his existence, but also that it belongs essentially to his dialogical world and is as such a dialogical phenomenon. Having said this, it needs to be pointed out that the nature of man's imagination as a dialogical activity is somewhat different from that of his other dialogical activities. While like them it enables him to confront the dialogical world,

it appears to do so by making him, so to say, *transcend* this world while at the same time remaining *within* it.

This confrontation through transcendence that man's imagination makes available to him could at one level be interpreted as a negation of the world in the sense of an escape from it, where 'escape' is intended to have the meaning of an essential non-confrontation. However, apart from the fact that negation—as we have indicated above—is never, in any of its forms, a nondialogical activity, the phenomenon of confrontation through transcendence is totally different and far more complex than mere negation: It is actually an attempt at re-creating the world. And this re-creation takes place not merely in a metaphysical, 'non-worldly' fashion, where the activity of man's imagination bears a truly transcendent character. Rather, this activity is never devoid of—and more often than not actually realises—the potential of transforming the 'real', the 'material' world. It is in this sense that Proust, when he was writing *Remembrance of Things Past*, had transformed his world, and van Gogh, when he was struggling to 'capture' the various shades of light, had transformed *his*. Nor is it an occasional Proust or van Gogh who is capable of effecting this activity or this transformation. The case of a Proust or van Gogh, or, even more truly, of a schizophrenic subject, provides only an extreme and therefore a less common instance of a more pervasive phenomenon. The case of a schizophrenic subject, is, in fact, the rarest of all insofar as the depth and intensity of this activity and transformation is here the greatest. It constitutes an instance where the world created by the imagination completely overwhelms and replaces through total transformation the so-called real world—so-called, because once the created world is the only world in which the schizophrenic subject lives, it becomes for him the only real world.

And it is here that the second point of the significance of our introducing the world of imagination in this discussion comes to the fore. This point lies in the fact that imagination seems to provide the human subject with so far the only possibility of transforming his world in the sense of making it nondialogical. This possibility inheres in the complete transformation that imagination seems to promise. For unless the inherited world of the subject has been transformed *completely*, that is, until it has undergone total re-creation, it remains, to a greater or lesser degree, a dialogical world. Does that mean that a completely schizoid subject is a completely liberated one? Given the model of the existential or life world that we have sketched so far, it *does* seem to mean exactly that. In this model, a potentially schizoid subject can only be said to have *imagined* himself into a schizoid world, a process leading, after a point, to an obliteration of his inherited world.

And here, before we proceed any further, it needs to be pointed out, needs to be underlined in fact with all the rhetorical power that one has at one's command, that this appears to be a damning indictment, of the highest order, of the world in which we live—this, the phenomenon of schizophrenia, which, despite all the willingness that may go into its making and therefore into the making of a schizoid world as an alternative to the one it rejects, expresses in its essentiality, and because of this very willingness, an *anguished unwillingness to leave this world*. Prompting one to ask: Surely there must be a less tragic way of transforming one's world, of ridding it of its dialogicality, and thereby of preserving one's essentially nondialogical self that finds itself at odds with this world from the moment it is born?

And a position we arrived at a couple of paragraphs above, where we said that "unless the inherited world of the subject has been transformed completely, that is, until it has undergone a total re-creation, it remains, to a greater or lessor degree, a dialogical world", has, indeed, within it elements promising the way to if not a complete transformation of a subject's dialogical world then at least a partial transformation of it. At the same time, this position is such that it has already made clear its propensity to force us—unless we want to *dis*continue to adhere to it—to introduce a modification in our model of the dialogical world outlined towards the beginning of this essay. We had contended there that if a subject makes a pact with the other, with the aim of ending his dialogical existence, it would not attain this end since the existence of a pact is predicated on a continuing recognition of the other which implies in turn a continuing confrontation with it. However, the position we have reached and mentioned above has opened up the possibility of attaining at least a partial closure of the dialogical world, for this position suggests that to the degree this world has been re-created to that degree it has become less dialogical. If this were to be accepted, then we have to admit that while a pact with the other would not end a subject's confrontation with it, it would certainly make this confrontation less intense thereby making his existence more bearable.

It would seem to follow from this that if we apply a similar logic to the phenomenon of appropriation, as different from a pact, we would likely get a similar result. That is, a partial appropriation of the other, in the pursuit of nondialogicality, by forcing him to become potentially less dialogical, would reduce the dialogicality of the subject's life world to that degree. If a pact can blunt the dialogical edge of the other, so should, it would seem, a partially effected appropriation. For even though it is different from a pact in essential make-up, it is similar in effectivity: a pact aimed at and realising a partial reduction of dialogicality is no more holistic in results than a partial appropriation.

This project, nevertheless, seems implausible, and for precisely the reason that makes appropriation different from a pact: the element of force implied in the former and seemingly missing in the latter, For force, it is clear, only pushes underground—rather than cutting it down—the dialogical potential of the other into a region where it impatiently waits for a chance to resurface and possibly regain its former stature.

However, is a pact really so different from appropriation? For, firstly, a pact may be forced by one subject onto another, or, secondly, it may be equal threat of potentially exercisable force that impels opposing subjects to arrive at a pact. In both cases, it is the involvement of force, actual or potential, which is the decisive element, and which reduces a pact essentially to an appropriation, with the difference that, here, this may be an appropriation that, under ideal conditions, is effected equally by contesting subjects.

In these ideal conditions at least, nevertheless—it can be contended—an appropriation through pact is actually a shedding of some dialogicality by both sides in an equal measure and, therefore, if at all it is an appropriation, it is one which is effected, as it were, by an abstractly existing third subject for the equal good of both the others. Enabling us to say that a pact under ideal conditions—that is, when both the sides possess or are capable of applying equal force—is *actually* a pact, and that a pact under *less* than ideal conditions is no pact at all but a one-sided appropriation.

VI

If a pact made by inequal subjects, however, does not reduce the dialogicality of the life world, and if to achieve this end, therefore, a pact must be made by equal subjects, then the possibility of resolving the problematic through a pact is very limited indeed. For in the life world, such as we find it, there are very few subjects who, at a given moment, may be said to be equal with some others, and even when they are so equal, they also have to struggle with the *inequal* others, below but more importantly *above* themselves. When the struggle is with those below (that is, who possess lesser power), a subject can hope to appropriate them or

at least to drive their dialogical potential temporarily underground, thus making his own life would that much less dialogical. But when it (the struggle) is with those above, he has no option but to either be appropriated (during this struggle), or, alternatively, keep some of his dialogical potential in abeyance till the moment for its retrieval and use presents itself.

This has two implications significant for the further course of this discussion. One, some subjects have to struggle harder than the others for the same or even a lower level of existence. And, two, this struggle is carried on at multiple levels of existence. While these observations are not in themselves new, they serve to indicate the richness and complexity of the existence of especially the modern subject and thereby the difficulty of arriving at a pact for this subject. For not only is it true that some subjects have to struggle harder than the others and that the struggle for existence has to be waged at a growing multiplicity of levels, it is also beyond denial that these levels are nearly as many as the individual others a subject has to encounter and confront in his daily existence, including the members, where applicable, of his most immediate group, the family. This not only makes the life of the individual subject an interminable stretch of timorous existence, it also means that not all of the struggle or rather struggles a subject may have to wage are institutional in nature. Indeed, it is one of the basic assumptions of this essay that a large—perhaps the largest—part of a subject's dialogical existence is spent in realms which remain totally beyond the available institutional arrangements at any given moment. From which it follows that these realms deserve as great—if not a greater—a part of theoretical attention as these arrangements are customarily given. It speaks of the ingenuity of fictional literature—and even of poetry and drama—indeed it speaks of its superiority over political theory that such attention is to be found in *it* rather than in the latter. Hence the case for a 'literaturisation', so to speak, of political theory, by which it is meant that political theory display the same sensitivity towards individual human condition and individual human consciousness as is found in fictional literature, and deal with them with the same minute subtlety and thoroughness.

In this context, the weakness of the most existing political theory inheres in its tendency to deal with the human subject mainly as a member of some collectivities, and with the larger of these collectivities at that. It is presumed that the subject becomes dialogical *only insofar as* he is such a member and—what only follows this—his struggle, through collectivities, is essentially against similar other collectivities. What is forgotten, first, is that a subject only *finds* himself a member of a collectivity, and that as such his collective identity is basically an imposition on him. Secondly, part of the dialogical consciousness of a subject stems from precisely this imposition, for this finding is one of the acts as well as the moments of the acquisition of this consciousness. It is this finding, the dawning of this knowledge—among innumerable others—that makes the subject from a being-in-itself into a being-for-itself, that is, that transforms him into a dialogical subject. And insofar as it transforms him so, it pitts him against not only the 'members' of other 'collectivities' but also those of his 'own'. The acquisition of dialogicality, thus, is a subjective act and a subjective moment, and so is the struggle a subject wages including against the members of other collectivities, and *as* member of his own collectivity. The other, it follows, is never a 'collective other', nor is the self ever a 'collective self'. It also follows, inevitably, that 'collective imagination' is an abstracted category, like the two other categories mentioned above. All these categories may facilitate analysis, but they can never lead to the acquisition of ever greater political understanding. The possibility of the acquisition of such an understanding presupposes the discovery of categories which are founded on a knowledge of the individual self embedded in an alienating world. This knowledge thus is *prior* to the discovery of these categories. But, does not *all* knowledge presuppose the existence of some conceptual categories? And if that is so, how would we arrive then at knowledge of the 'individual self embedded in an alienating world' without such categories? The answer is: a knowledge of the individual self is not dependent for its arrival on an exercise of thought whereby 'an exercise of thought' is meant a *reflection* on the 'objective' world. Rather, it comes via an *experiencing* of the life world by the selfsame individual subject. This process of experiencing of the life world is akin to the one through an unfolding of which works of art are born. The birth of a political theory carrying within it the possibility of an ever increasing understanding of the dialogical world is therefore akin to the birth of works of art. Works of art however—and our model here is primarily fictional literature—do not treat and cannot treat by their very nature the dialogical world in separation from the overall existential or life world. Nor can political theory, so-called, do such a thing—that is, *not* treat the dialogical world as a part and mere extension of the existential world—and still carry within it the possibility of an ever expanding understanding of the dialogical world. This essay, which is rooted in an experiencing of the life world by an individual subject, namely, this author, may be taken as a preliminary attempt at an alternative political theorising.

A Primer on Fiscal Sanity

Deena Khatkhate

Public Expenditure Management by A Premchand; International Monetary Fund, Washington, DC, 1993; pp 282.

THE main *raison d'etre* of economics as a science is that it helps to understand how scarce resources can be managed to meet competing demands on their use. And yet there is an unbridgeable chasm between economic theory and policy. Debate on policies typically ignores the essential element of efficiency, whenever the issues are raised of what the government should mobilise and how it should spend what it mobilises by way of taxation and borrowing. A major reason for this hiatus between economic theory and its application to government operations is that economic logic is elided in favour of economic ideology, whether of the right or the left. This is reflected generally in four policy areas—taxation, public sector role in the economy, stabilisation policy and the nature and limits of government intervention.

It used to be seriously argued in the 1960s that the more the taxes raised as a proportion of GDP, the more was the expenditure incurred by government. The question was not asked why this should be so; whether expenditure was a dependent variable, being solely governed by the amount of tax receipts, or an autonomous variable; and whether the expenditure that followed taxation was a total waste. The same argument appeared in a different guise but with the same connotation more or less when the supply-side economists like Laffer came up, during the Reagan era, with their laughable nostrums that the rate of growth of GDP was inversely related to the tax ratio. All that was put forth as a self-evident truth was that the expenditure out of tax receipts was all unproductive.

The controversy on the public sector and its rationale is also, more or less, of the same genre. If the state sets up industry, it is necessarily unproductive or less productive than industries in the private sector and therefore the GDP growth is less than it would have otherwise been. This may or may not be the case, if the public sector is efficiently operated. In other words, the issue should have been posed more in terms of how investible resources are employed.

The discussion on stabilisation policy generally focuses on how the fiscal deficit should be reduced and the implicit arguments in the discussion centre on it. Those who ideologically support the government's role in critical investment as being central to the economy would not like capital expenditure to be reduced to achieve fiscal consolidation. For them, the government's capital expenditure is sacrosanct, regardless of how it is incurred. Those who are on the other side of the ideological divide stress the fungibility of money. The resources saved through scaling down government capital expenditure are available to the private sector. Though nothing explicitly is said about efficiency, it is just inferred from vague pronouncements on the subject.

The last stream of arguments relates to the nature and limits of government intervention. Here again, it is taken as axiomatic that government intervention is a superior or inferior policy, depending upon one's perception of the nature of the state. In general, a case for state intervention is made on the ground of market failure, which is commonly observed in many developing economies. But that in itself should not justify state intervention. There are transaction costs both in market and government transactions as Ronald Coase long ago emphasised. Markets are efficient and function best when the transaction costs are low, in fact lower than the benefits that markets yield. Otherwise government should enter the scene to correct market failure. But the case is not unambiguous unless it is shown that the transaction costs of intervention are lower than the benefits it might bring in. However, these issues are slurred over both by the supporters of government intervention and its adversaries. The arguments of the former are buttressed by the false anologies of South Korea, Taiwan and Singapore, which have successful economic regimes, however defined, and they are countered by the latter through recounting the experience of countries in Latin America, south Asia and Africa which have starkly failed under autarkic policies.

All these four strands of ideas have one common thread—they are all abstracted from the central criterion of efficiency. Taxes can be raised and expended, but the point is whether they are efficiently spent and here efficiency is defined in the economic sense of maximum benefits from the use of minimum resource. The same could be said about public sector operations, stabilisation policies which reduce capital expenditure and the extent of state intervention. In the final analysis, it all depends on how the expenditure by the state is managed. The great merit of Premchand's book under review is that it deals head-on with all the relevant expenditure management problems in the author's usual thorough and comprehensive manner, first revealed in his scholarly and much-lauded work on *Government Budgeting and Expenditure Control*. It offered an expose of the battle royal between the budgeter and the economist. This book has a wider canvas and a fair amount of philosophical rumination with the author tangentially and elliptically pulling the legs of administrators, politicians, economists and other functionaries at different layers of the government.

Premchand does not deal merely in attractive but innocuous niceties of expenditure management. He straightaway enters the main battleground in a combative spirit. "Practical politics have an enormous influence on these processes. Indeed politics is what spending is all about and this is an integral part of expenditure management. But conventional wisdom holds that politic· ·dominant in policy formulation, and that implementation is administrative in nature. This is a myth however—for political influen-ces and the interplay of political forces are to be found at every stage of management. They may be hard to measure, but the results often show the footprints of politics" (p 7). If what Premchand so clearly elucidates is recognised, it will be easily seen why most of the debates economists revel in are sterile. Politics supersedes economics and the casualty is economic rationality. However, after having caught the bull by the horns, Premchand steps back. The technician and careworn budgeter in him wakes up. He shuns "the political forces or the role of the legislature" and considers expenditure management at second remove from politics—"from the point of view of the decision-maker (concerned with both policy formulation and implementation) who, notwithstanding the influence of his public or private religion, has to address issues in that role" (p 7). Then he proceeds to 'chalk' out, in his scholarly style, the expenditure management strategy. He thinks that such a strategy would overcome the problems created by 'uncertainty'. The need for a strategy is inherent in the long process of expenditure management, in which each stage of the system has a separate vision and its own scale of values. These visions and values have to be blended into a harmonious whole. Premchand's stratagem is no doubt correct and is probably necessary to discipline finance ministers and politicians, but how can one ensure its success if it is abstracted from *realpolitik*? In the world we live in, expenditure

management divorced from the political element is just a curiosum and can hardly be used as a tool to keep profligate governments within the bounds of "propriety, accountability and the adequacy of the system for delivery of services to the community" (p 48).

The importance of non-technical considerations or factors which cannot be dovetailed systematically in an "expenditure management mechanism" is thrown up in sharp relief by Premchand's well-articulated and innovative device of "modular presentation of features" of expenditure control drawn from a sample of countries of all categories—industrial, centrally-planned and developing—which use different systems of expenditure control. What these countries actually do in the field is derived from their responses to the questionnaire issued by the author. The responses are revealing. Here is how countries use expenditure management: "In public expenditure planning, industrial country representatives felt that excessive political interference was a major problem. The representatives of the planned economies thought that the major problem areas were excessive regidity in expenditure and fragmentation of responsibilities between planning and finance agencies, whereas officials of the developing countries, in particular those from sub-Saharan Africa, viewed expenditure planning as a major problem."

"In the cluster relating to the attention paid to special problem areas, officials from industrial countries believed that productivity in government operation and maintenance expenditures received the least attention. While sharing this view, officials of planned economies thought adjustment for inflation received too little attention. Officials of developing countries believed that control of personal expenditures was the major problem. In regard to resource planning, officials of industrial countries believed that the absence of convergence between expenditure and revenue budgets at an early stage of the process was a problem, while those from planned economies and the developing countries felt that the planning of revenue resources (and external resources for the developing countries) constituted a major problem" (pp 50-51).

The factors identified in Premchand's modular presentation based on empirical findings highlight the one fundamental theme that it is the political element and the nature of governance, whether in relation to "rigidity of expenditure", "conflict between planning and finance agencies", "inflation control" or "resource planning", which are overpowering in determining the pattern and magnitude of government expenditure. It follows therefore that the efficiency of expenditure management is a correlate of the political element and any analytic framework devoid of the latter will have no more than ornamental value. Authorities like Verne B Lewis and K N Chaudhuri, who Premchand quotes in profusion, have come, more or less, to the same conclusion through deductive reasoning. Lewis, for example, points out that "governments fail not so much because of lack of effort, but because they do too little or too late or too much" and as a result "the underlying approaches to expenditure management remain the same". Chaudhuri is more frank in concluding that the "fundamental characteristics of a structure [expenditure management] remain unaltered despite outward transformation".

What lessons can be drawn from the erudite study of Premchand for managing the expenditure of governments? An optimist would delve into the analytics of expenditure control, raciocinate on economic logic and the imperatives of good governance and come with an impressive tome on how expenditure should be optimally managed. Premchand is an optimist and his scholarly, well-written book should be considered a heroic effort helping those wanting to rescue us from the labyrinthine government machinery. A pessiment would throw up his hands in despair and refrain from fighting a losing battle, but plead instead that governments, if they cannot extirpate the matastasis of political interference, should confine themselves to that level of expenditure which is essential and minimal and which, even when interfered with by the political authorities, will impair the least the economies of the countries and their citizenry.

Rule of the Contented

G Parthasarathy

The Culture of Contentment by John Kenneth Galbraith; Houghton Mifflin Company, Boston, New York, London, 1992; pp 195, $ 22.95.

THIS book is about the attitudinal changes in the behaviour of the majority affluent towards the minority poor in the US in the 1980s, from one of concern to that of gross indifference. Galbraith, in his inimitable style seen in *The Affluent Society*, and other works, describes the culture of contentment and narrates the transition to it in 15 eminently readable chapters. What makes the book of absorbing interest to Indian readers is the parallel to the current situation in India. The situation here is marked by the culture of contentment of the minority elite and lack of concern towards the majority poor.

The first chapter titled 'The Culture of Contentment' traces briefly what the Roosevelt administration did to save the capitalist economy and ensure a more stable and secure economic life. As a result, a contented majority has emerged on the scene. The government is accommodated not to the reality of common needs but to the beliefs of the contented who are now the majority of those who vote.

The contented majority is comprised of people who manage to be in the middle and upper reaches of the great industrial corporations; independent businessmen; those in lesser employment but whose compensation is more or less guaranteed; the larger population of lawyers, doctors, engineers, scientists and accountants; families with dual pay cheques; a certain, if diminishing, number who once were called proletarians and those whose wages are now supplemented by those of a diligent wife; big farmers benefiting from price support programmes; and the aged living on pensions for whom there is adequate retirement allowances and for whose remaining years of life there is adequate and ample financial provision.

The first and most general expression of the contented majority is its affirmation that those who compose it are receiving their just rewards. The second characteristic of the contented majority is short-run public inaction in preference to protection of long-run interest. The third is a highly selective view of the role of the state, that the need is to get the government off the backs of the people. Significantly, exceptions are made only in the case of (a) military expenditure and (b) expenditure on interest payments. The fourth expression of the contented majority is the tacit approval of growing inequalities.

Much that is being attributed to ideology, idiosyncrasy or error of political leadership has deep roots in American polity, particularly the doctrine that if a horse is fed amply with oats some will pass through to the road for the sparrows.

There are people who do not share the comforts of the contented majority, they are concentrated in the slums of great cities; on deprived farms; as rural migrant labour; as more diffused poor of the old south; and as members of minority groups, blacks or people of Hispanic origin.

The underclass is integrally a part of larger economic classes and more importantly it serves the living standards and the comfort of the more favoured community. This class is needed so that the more fortunate may be relieved of distasteful, disagreeable and low paid jobs. However, the theory upheld by the contented majority disguises these facts. The shift in studies on poverty without reference to the macro context in which the poor grow forms part of this effort towards the suppression of fundamental facts.

Galbraith brings out the perverse effects of the recent theories of taxation and public services. Public services and taxation have disparate impacts on the contented majority and on the underclass. The contented majority seeks reduction in taxes and curtailment of welfare services.

In two chapters Galbraith brings out the modern accommodation of economics of the culture of contentment. There are three basic requirements to serve contentment. One is the need to defend a general limitation on government spending; a second more specific need is to find social justification for the untrammelled, uninhibited pursuit and possession of wealth; and the third is to justify a reduced sense of public responsibility for the poor.

In the culture of contentment a distinction is invoked between private corporations and their public counterparts in relation to the bureaucracy. The former is perceived as efficient whereas the latter is thought to be mentally moribund, seriously incompetent and offensively arrogant. The large, private organisation cultivates its acceptance in several ways: (i) through regular rewards to those who surrender independent thought; (ii) through diminishing the role of thought itself; and (iii) through increase in the number of persons who are subject to the influence of cultural contentment, though bureaucracy is a hated word in the culture of contentment. Immunity from criticism of the bureaucracy from the private sector is central.

Galbraith comments that very few who cite Adam Smith in favour of the preceding propositions have read his great book. "Smith was in reality, the supreme pragmatist, and with much else, was fully open to a necessary or useful role for the state. Smith was also alarmingly doubtful about some of the more cherished capitalist institutions of our time" (p 99). The inspiration for the culture of contentment came more from George Gilder, a free-lance philosopher whose *Wealth and Poverty* acquired a biblical standing in the early 1980s. Gilder called for the necessity for faith as opposed to reasoning. He avowed that material progress was ineluctably elitist: it made the rich richer and increased their number, exalting a few extraordinary men who could produce wealth over the democratic masses who consumed it. Gilder warned: "material progress is inimical to scientific economics, it cannot be explained or foreseen in mechanical and mathematical terms". He further pleaded that regressive taxes helped the poor; "in order to succeed, the poor need most of all the spur of their poverty".

Gilder's faith was supported by the taxation doctrine of Arthur Laffer who said that reduction in taxes would not diminish but increase aggregate government revenues. While Gilder and Arthur Laffer supported the theory of wealth accumulation by the rich, Charles A Murray pleaded that the poor are impoverished and are kept in poverty by the public measures particularly the welfare payments that are meant to rescue them from their plight.

In two well-written chapters on 'The Military Nexus' Galbraith unfolds the autonomous character of military power. This prevented any reduction in military expenditure even after the Soviet power collapsed. Understanding of politics in our time will continue to require an appreciation of the depth, breadth and influence of modern military power. The chapter on foreign policy brings out its recreative role.

In two concluding chapters Galbraith raises the question 'what then is the future?' of the culture of contentment. He reflects on some possibilities of change: (i) adverse develop-ments that will challenge the sense of comfortable well-being; (ii) widespread economic disaster; (iii) adverse military action that is associated with international misadventure; and (iv) eruption of an angry underclass. A severe recession or depression would shake the political economy of

contentment and lead to change. But such a result is even now far from certain since in the half-century and more since the New Deal the position of the contented has been gradually strengthened, very specifically by the measures then so vehemently resisted. One of the still-acknowledged threats to contentment is inflation. Unlike the effect of declining output and unemployment, its effect is felt across the full spectrum of the economy. Therefore in the age of contentment it has become a matter for deep concern.

The military power in its substantial strength would be a threat to the culture of contentment in the future. Though the need for military deployment and action against areas of communist expansion has lessened, it should be recognised that the military establishment in the US operates out of an internal power of its own. As a consequence, the military budget has remained relatively unaffected. Another threat to contentment comes from those who are left outside its comfort—from the underclass in the urban slums to which it has been extensively consigned. However, the members of the underclass are not a homogeneous group. Yet the possibilities of an underclass group revolt, deeply disturbing to contentment, exists and grows stronger. No one should be surprised if the growing unemployment in the underclass should lead to a violent reaction. Galbraith writes, "it has always been one of the high tenets of comfort that the uncomfortable accept peacefully, even gladly, their fate. Such a belief today may be suddenly and surprisingly disproved." In the context of such developments, the reaction of the community of contentment is to resort to the hiring of personal security guards; to escape to the safe suburbs; to more extensive use of the enforcement of laws of detention for those who revolt against the culture of contentment; to armed repression by the police and then by the military.

In the concluding chapter titled 'Requiem', Galbraith reflects on the possibility of the collective force of democracy correcting the situation in favour of the underclass. But he does not foresee this possibility in the context of criminalisation of politics.

Basic to this greater long-run security of the contented is the nature of the modern industrial economy. The need for increased public expenditure is discounted. Similarly, the need for taxation to reduce the deficit in the federal budget is also discounted. Nothing in the age of contentment has contributed so strongly to income inequality as the reduction in taxes. Here the collision between wise social action and the culture of contentment is most apparent. Further, the dismal consequences of speculative activities of the savings and loan associations would have been prevented by scrupulous regulation. The mergers and acquisition mania of the 1980s could have been altered in the early stages by legislation requiring hearings and a waiting period to assess the virtue of any large substitution of debt for equity—the universal feature of corporate raiding, other mergers and leveraged buy-outs. Similarly, though the importance of education is recognised, the willingness to appropriate public funds, especially for spending on schools in the central cities, has been lacking. The resources now going to the military establishment, those devoted to such dubious weaponry as Star Wars would, if available, work a minor revolution in education. But no one should doubt the formidable opposition of the autonomous military power. As a consequence of such policies adversely affecting the poor, the number of Americans living below the poverty line increased by 28 per cent in just 10 years from 24.5 million in 1978 to 32 million in 1988. By then nearly one in every five children was born in poverty (p 107).

Galbraith concludes his book on a sad note. He writes: "In the past, writers, on taking pen, have assumed that from the power of their talented prose must proceed the remedial action. No one would be more delighted than I were there similar hope from the present offering. Alas, however, there is not."

Colonial State and Colonial Working Conditions

Aspects of the Experience of Bengal Jute Mill Hands, 1881-1930

Parimal Ghosh

This paper examines certain facets of the working conditions in the jute mills within the triangular structure constituted by the colonial state in India, the Anglo-Scottish management of these mills in and around Calcutta, and the labour force employed therein. The paper concentrates on two issues, those relating to the minimum age of the workers and their hours of work, and argues that the rules concerning these were systematically flouted by the employers with the connivance of the state.

IN any account of working class history a major part is always occupied by a consideration of the work process within which the worker functions. It is this process which shapes the worker, determining his existence as such. Obviously, the worker is not an isolated individual, he grows up and develops within a certain ambience, in a certain relationship with his context and, above all, with his employer. In a way, the position of the employer within the configuration is more crucial than any other element. The extent to which he is separated from the worker, with a distinct identity, directly determines the details of the work process to which the worker is subjected. The history of the working class is more a history of the worker's generalised relationship with his employer established through the work process, and of his generalised responses to it, than anything else.

The role of the state here assumes a particularly critical importance. To make another obvious statement, the relationship between the worker and his employer as mediated through the work process functions within a network of laws, formed by the state in its capacity as the regulatory agency of the society over which it presides. Now, the state regulates but in turn is also regulated by the cross currents within the society. The tension within the society, in this case, primarily the tension between the working class and the class of employers, is, therefore, reflected in the laws which establish the modalities of the worker-employer relationship. The relative strength of the worker and of his employer determine the specific orientation of the laws.

But the question, which always attains vital importance, is what role the state plays *vis-a-vis* the employer and the worker. For all practical purposes, as the ultimate arbiter in the general affairs of the society, state has to assume a neutral facade and maintain an equal distance with the two players in the game. Yet, the state can assume the role of the arbiter only when it, paradoxically, agrees to behave as the representative of the ruling class in the society. Its autonomy, indeed, its sovereignty, can survive only as long as it agrees to not exercise its privilege as truly neutral. Although for brief periods state can appear to act as autonomous, effectively its actions must, consciously or unconsciously, benefit the interests of the ruling class, if it has to survive. There is, therefore, necessarily, always an attempt on the part of the state, to pose, to hoodwink, the general society, and pass off the interests of the ruling class as the interests of all the other classes in the society. From the other side, it also remains true, *a la* Gramsci, that the ruling class can effectively function as the ruling class only when it is able to establish its hegemony over the rest of the society. The extent to which it is able to do so determines the extent to which the facade of neutrality of its representative, the state, is maintained, and the fiats of the state are accepted, willingly, by the rest of the society.

This position is further emphasised in a colonial society. The only crucial difference is that the anxiety of the colonial state to maintain the neutral facade is naturally less, and there is a much bolder proclamation of the colonial interests as its paramount consideration. Yet, it is of great interest as to how much time and energy is devoted by the same colonial state to demonstrate that at the back of all its actions lies the welfare and benefit of the natives whose destiny had been to come under its benign dispensation. It is, of course, easier to see through its preachings and practices than is the case with a non-colonial state. The colonial ruling class as composed of the white officials and their native collaborators are so much racially and socially separated from the rest of the society that the question of trying to establish and then to maintain hegemony does not really arise. The neutrality of the state, therefore, is, to that extent, less important. It is, therefore, possible to argue that the real conflict, so far as workers in a colonial state were concerned, lay, more palpably, not so much with their employers as with the state, which acted as their surrogate.

This view assumes further importance if we consider another aspect of the situation. Capitalist industry, wherever it may have occurred, be it in the metropolitan country or in a colony, exhibited in its early stages the same ferocity when it came to labour exploitation and extraction of surplus. Sweated labour existed everywhere and a mere narration of facts about factory process is not likely to reveal the specificity of conditions in a colony. This would necessitate an understanding of colonial mentality, which precisely speaking, was external to the working of capital in the colony, but, which nonetheless, it must be understood, modulated its functioning. This is exactly the reason why the colonial state, with its various limbs for enforcement of authority, assumes that much criticality in any understanding of a situation of this kind. Colonial state, epitomising colonial arrogance—the arrogance of race, of being victors over the vanquished of the whites being the walking gods on earth—was reflected in the motions of colonial capital. The limbs of the state, the factory inspectors, other bureaucrats at various levels, the police, and so on, articulated this. Profit motive of the mill owners was there and, as would be seen, the question of sustainability of the industry would be repeatedly raised whenever the issue of providing relief to the mill hands came up. But above all there would be the confidence of knowing better, of being privy to a knowledge that the natives were different, requiring a treatment different from the one that may be conceded to the workmen at home. This is why the connivance between the state and the mill owners in the making and unmaking of laws became that much more palpable and critical in the colonies than elsewhere.

On this general format, we propose to examine certain facets of the working conditions in the mills within the triangular structure constituted by the colonial state in India, the Anglo-Scottish management of the jute mills in and around Calcutta, and the labour force employed therein. We have

chosen the jute mills as the focus of our attention primarily because they comprised the premier industrial interest group in colonial India. The period chosen is from 1881, the year of the first Factory Act, to 1930, the year the Royal Commission on Labour was constituted, because we feel that these years provide us with a fairly convenient set of years in which to investigate the problem.

To go back to what we started with, we consider this aspect of the workers' experience to be of importance, as it was in the interstices of these relationships that the existential problems of the workers were formed and articulated. To better highlight our problematic, we shall concentrate on two issues, those relating to the minimum age of the worker, and his hours of work, and show how rules concerning these were systematically ignored and flouted by the employers with the connivance of the state.

The discussion is divided into several sections. We begin by a brief survey of what the various factory laws in this period warranted; then we outline the actual working conditions prevailing in the mills; finally, we take up the matter of official attitudes as it prevailed in this period.

I

The first Factory Act, passed in 1881, decided that the minimum age of a child worker should be seven years, with a maximum permissible working time of nine hours a day. They were also to have a minimum of four holidays in a month and fixed intervals of rest during the working day. No other category—adult male or adult female—it may be noted, was touched upon in the act.

In 1891 the government of India set up Factories Commission which suggested some changes, leading to fresh factory legislation. The minimum age was raised from seven to nine with a seven-hour day for child workers between nine to 14. Women were to do an 11-hour day and restrictions were imposed on their working after 8 p m and before 5 p m.

The next phase of factory legislation started in 1907 when a new Factory Labour Commission was appointed by the Home government leading to a new law in 1911. Restriction was now put on the working time of textile units, the maximum limit for which was fixed at 12 hours. Child workers in textile units were to do a six-hour day, and women 11.

The first world war saw several important changes in this regard. To start with, there was a rapid expansion in production followed by a slump when the war-induced demand began to fall. Further, international labour welfare movement began to gain pace affecting the stand of the Home government and the government of India. All these led to fresh official intervention into labour matters while making big employers amenable to changes. By the amendment to the Act of 1911 in 1922, therefore, for the first time hours for adult male workers were specifically restricted to 11 per day and 60 per week. Women could not be employed before 7 a m and after 5.30 p m and the minimum age of a child worker was fixed at 12 with a six-hour day for 12- to 15-year olds. There were rules regarding compulsory rest and holidays.

II

A: The principal working pattern in the jute mills throughout the period remained the multi-shift system in which batches of workers attended the machines in shifts, so that each batch secured an amount of rest even while the machines were constantly in operation. Understandably, this way of working required more hands than if one batch of workers had worked the whole day. In the 1920s, there began a tendency towards single-shift working which meant that one batch of workers attended the machines in two shifts with a small break in between. The main reason behind this, apart from more stringent application of rules, was that the mills were now anxious to cut down production after the war.

Two general features of mill working, those of excess hands and extended hours, were seen right from the beginning of the period. In 1879, A Crabbe, the manager of Champdani Jute Mills, reported that with shift system his mill worked 12 hours a day. For children and young persons this meant 8½ hours of work at an average, and it was claimed that since they were allowed to go out for bath and refreshment, the actual working period came to 7½ hours.[1] India Jute Company, which again worked on shift system, reported that this required one-third more hands than was strictly necessary. As D Cochrane of this mill described, a worker belonging to groups A and B started work at sunrise, left work at 9.30 a m for 2½ hours, returned to work at noon and continued till sundown with an hour's leave in the mean time to eat or to smoke. A worker of group C, on the other hand, started at 9.30 a m and worked till sundown with an hour's leave in the afternoon.[2]

We must note that there was nothing to ensure that these schedules were strictly followed in course of working. In September 1909, the officiating chief inspector, Adams, would observe how easily the shift system could be manipulated to prove that different groups of operatives were working the successive shifts, while in actual practice "neither the inspector, the manager, or his assistants will be in a position to state the exact number of hours worked by different classes".[3]

It appears from the evidence before the Indian Factory Commission of 1890 that the day for the hands began around 4 a m when the buzzer was sounded and the mill started to work by 5.30 a m. It was then a 4-day week. Women worked as much as men; children started with them and were let off from 9 a m to 12 noon, or from 12 noon to 3 p m, leaving finally at 6 p m. This, as we can see, was same as the adult hours, and not any the less as claimed by Crabbe of Champdani Jute Mills. Weavers were supposed to work continuously and not by shifts. For relief, an arrangement was worked out by which a weaver going out had his loom looked after by his neighbour on the shop-floor. On the last working day of the week, the hands, usually the males, attended to clean the machines after regular hours.

By the mid-1890s workload seemed to have increased substantially with the introduction of electric light. In May 1895, Walsh, the chief inspector, found Howrah, Sibpur and Ganges mills working with electric light up to 8.30 or 9 p m. At Ganges mill, he even found over 100 children, averaging 9 to 10 hours, working in the spinning rooms. In Hastings mill, though there was nothing to show that under-14s were employed at night, Walsh did find a large number of young persons working. What Walsh could not verify was even more terrible as a commentary on the penury of the workers. He did not know how many of the hands in the night shifts also did day hours in other mills. He could only conclude that it would be impossible for any one to continue long under such conditions, and that neither would it be very profitable for the mills concerned.[4]

The state of affairs did not improve after the turn of the century. In November 1905, Walsh informs that with the exception of the Gouripore Jute mills, all the mills were doing 15 hours a day. He calculated that roughly 20,000 women and half of the 16,000 nine- to ten-year olds were compelled to leave home at 4.30 a m to attend the mill.[5] At times, when the mills were short of hands, a percentage of the children were induced to work extra hours on small payment. About the same time, in 1906, Halliday, the Calcutta police commissioner, reported how the existing law was frequently evaded where child labour was concerned.[6]

We have already seen that the shift system did not apply to the weavers who had a system of mutual help to secure relief. That sometimes this did not help is shown by the petition by the weavers of Hastings Jute Mills to the government in July 1906 about the pressure they had to endure. A remarkable document in many ways, it is perhaps the only instance where we have an insight into how the hands themselves looked upon the

work schedule. As it stated, they had to work from 4 a m to 8.15 p m with an hour's leave for meals. The weavers pointed out that this left them with only five hours of night rest, which was "very insufficient for recreation". The result was "by excessive and hard toil", they had to "suffer from constant illness and thereby gradual decay in health; [and] slowly drag themselves towards their graves".[7] Walsh thought that the petition was an exaggeration but his own investigations seemed to reveal much that was true in it. According to him, the men worked from 5 a m to 8 p m, and though they did piece-work, i e, they could come early or late as they pleased, they had to deliver a minimum quantity fixed by the employers. The mill had no objection if the weavers helped each other out on their looms but apparently this was not very practicable for want of what Walsh considered to be lack of trust among the weavers. The result was long hours, which Walsh thought was "altogether wrong, and must be detrimental to health..." He was convinced that no man could stand at a loom "for more than 10 or 11 hours and keep it up month after month doing good work..." But the weavers were doing 14 hours a day. The worst part was that this was not illegal either—"it is quite legitimate to work the men any hour so long as half-an hour's interval is provided in the middle of the day for meals".[8]

More palpable irregularities were found by the Textile Labour Committee of the time. In fact, it was told by a European manager of a large mill employing 400 children that there was no such thing as half-time employment in any mill, and that he did not know of any factory act restricting child labour in this way. Another European manager of the same mill conceded that though work was carried on in shifts, when there was pressure work would continue beyond the specified period, and that there was nothing to prevent the children in one shift from continuing in the next.[9]

The Factory Commission of 1908 tried to control this by indirectly restricting the factory hours. So it was suggested that female labour may be employed for 12 hours between 5.30 a m and 7 p m, children for six hours, and that there may be a "young person" class from 14 to 17 with a 12-hour day. The government of India, however, considered that the regulations on women labour was retrogressive for the existing law allowed only 11 hours; besides, the 'young person' class was considered to be cumbersome from administrative point of view. It was, therefore, decided that work in textile factories would be restricted to 12 hours with women doing 11 hours as before. The catch, however, lay elsewhere, for all this was to be effective only if the units were not on any approved shift system. As it actually turned out, by July 1912, when the new act came into operation, the mills came up with an elaborate system of shifts which amounted to 13½ hours of continuous work from 5.30 a m to 7 p m. As the chief inspector discovered, it was extremely difficult to regulate work under such conditions, and to detect or avoid irregularities in the hours of women and children. Sixty-five of the 71 jute mills were now doing 13½ hours with an almost even pressure on all kinds of workers. In shift system, Adams found, for children of shift A, comprising 50 per cent of the total employed, the period of work came to 13½ hours. For B, C and D shifts, about 30 per cent of the total and 7½ hours, and for the rest 20 per cent and six hours. Again, for 75 per cent of the men and women, shift system implied 13½ hours of work, and 10½ for the rest.[10]

By 1922, some statutory changes had come up. There was a tightening up of regulations for women and children, and for the first time adult male day came to be restricted to 11 hours. Together with more effective arrangements for inspection, this led to a gradual abandoning of multi-shift working for the single shift, where the same batch of hands worked through the day with a rest period in between.[11]

How far this affected the length of the working day is a different question. By 1928, the single shift system was well established in the mills. Yet, as Adams notes, out of a total of 53,000 women in the mills, 40,000 worked from 5.30 a m to 7 p m. This was quite the practice in the single shift units and for 60 per cent of the women in the multi-shift mills.[12] A labour activist in the late 1920s also noted how, without a clock in every department, 10 to 15 minutes extra work was carried out. Taken together, in a multi-shift mill extra working may have been close to an hour or more in a day. It was also said that mills often worked stealthily with guards watching the gates.[13]

B: It should be clear by now that working extra or long hours remained a constant feature in this period. It has to be shown, however, how its logic lay within the system, and why the legal regulations were being repeatedly evaded.

Even at the time of the first Factory Act in 1881, it had been noted that curtailment of hours was likely to affect the system of production directly. D Batchelor, manager of the Budge Budge Jute mills, had then observed that shorter hours would keep the labourers away, for their earnings would not be enough to induce them to do factory work. But more importantly, he said, "I am fully persuaded that such an act would so fetter the industry that it would be impossible to work these concerns to profit..." Even more forthright was Downs, manager of Bowreah Cotton mills: "it will take very little to strangle these industries, and I think the proposed act [i e, the Act of 1881], if passed into law, will most effectually do so".[14]

It may be remembered that all that the first Factory Act did was to fix the minimum age at seven with a nine hours limit on the day's working for the child labour. There also had to be a minimum of four holidays in a month.

In the mid-90s, again, Walsh pointed to a different aspect of the system as the source of long hours: the cut-throat competition among the mills. So, "while mills are represented by Calcutta agents, the majority of whom receive commission on the gross out-turn of the mill, and not on the profits, it will be naturally in their interest to advocate these excessive hours".[15] Walsh made the same point again in 1904, and in 1909 he was quoted with approval by the next chief inspector, Adams.[16] In 1906, further, the fragility of inter-mill co-ordination on cutting down work was noted by Walsh. For, the overwhelming anxiety of every management was that its mills should not fall behind its neighbours.[17]

The pressure that was generated at the top naturally percolated downward to the shop-floor supervisors. The 'sardars' have long been blamed for the abuses that went on, specially in the employment of children. It was they who supplied the labour and reportedly were sometimes strong enough to defy the management. In 1909, thus, Adams suggested that the forthcoming bill should make liable to prosecution their abuse of the law.[18]

Yet, though the 'sardar' undoubtedly had a big stake in what he did, for his cut on every man employed under him was substantial, he in turn was subject to a lot of pressure. The work routine of the industry over time became a finely tuned schedule, geared to secure the maximum return for the mills. And the running of that schedule depended considerably on the adequacy of the labour supplied by the sardar. Again, it must be noted that there was no co-ordination between the mill managers or the agents to regulate labour supply. So that when supply was short, there had to be keen competition among the mills to secure their respective requirements. The manager had either to overlook the numerous irregularities practised or face a shortage, reducing out-turn and seriously affecting his position with his managing agents.[19]

In 1928, Adams elaborated that "tremendous pecuniary interests" were involved in the machines' running continuously for 13½ hours a day, four days a week. And that entailed that the requisite number of workers should be present at the machines during the whole period. However, the sardar, who was responsible for this supply, could never know of any shortage through sickness or otherwise until the shift had commenced. He, therefore, had to be ready with hands irrespective of whether they were legally fit

to work or not. "It seems to me, therefore", Adams wrote, "that owners of jute mills, knowing and fully appreciating these circumstances...can only have one motive and that is the maintenance of the flexibility of employment of labour within the mills so that fluctuations in the availability of labour can be immediately and readily accommodated in order to ensure that continuity of production and maximum output may be obtained at all times. In other words, they seek to subjugate the requirements of the act to the requirements of the industry."[20]

It was often suggested that workers did not favour any shortening of the hours as that affected their overall earnings.[21] More careful assessments seem to suggest that upcountry temporary hands did not mind the long hours as that meant quicker money and shorter stay away from home. On the other hand, those who came to adopt factory work as their permanent occupation, resented the long exhausting hours and preferred a shorter day even with reduced earnings.[22]

However, such differences in outlook may not distract us from the basic contention that the long hours were an integral part of the system. After all, it was not the inclination of the unskilled hands which determined this routine as did the "tremendous pecuniary interests" involved.

Besides, there were other aberrations arising from the same source. The Textiles Factories Labour Committee, for instance, had observed how certification of child labour had become "purely permissive". In some units, they were procured, in others not. It frequently came to the notice of the committee that in mills where hundreds of children were employed, there had been no visit from the certifying surgeons for periods varying from several to 18 months.[23] This, in fact, allied well with IJMA's stand in the same period that certificates of age and physical fitness for employment should not be required for either half-timers or adults. For this would imply idle machinery till certificates were secured. This problem would be specially severe during the annual exodus in April-May-June, necessitating quick replacement, and prior certification would make that impossible.[24]

The workers' readiness to submit to these and other abuses has also to be explored. That was the other side of the problem which made the aberrations so vexing. One official suggested that all child workers should be tested with irremovable metal rings to make impersonation difficult;[25] another suggested whipping of the under-aged when they were caught.[26] The same conditions, again, made the government inspector more a terror than a source of much needed relief to the illegally employed. Adams, in his deposition before the Royal Commission on Labour, thought that this fear was the reflection of their poor understanding, and of the ignorance of the sardars who controlled them.[27] It may well have been more directly a fear of losing their jobs.

The same situation led to another abuse in the mills, the bribes the hands had to pay to secure their job and then to keep it. In 1918, Adams observed that out of 27,709 child workers in his jute mills 18,000 were seemingly fresh hands, where the normal figure should have been 5,000. The difference showed the gains made by the sardars and their associates.[28]

Bribery did not have to stop there either. In the late 1920s, labour activists alleged that a cut from what the sardar received had to go to the European in-charge of the department. The European seldom took cash. "It will be sufficient if you supply his table by marketing for him. This 'marketing' is, of course, a comprehensive term, for it does not include merely plantains, gourds, cucumbers, cabbages, etc; it is very often an affair of gold and silver in as much as the sardar has to pander to the passions of the Europeans by procuring for them brandy and concubines. Many a mill hand in his inability to procure hard cash for his bribe has to execute promissory note for the same, which he has to pay off by weekly instalments together with the interest accruing on it."[29]

C: It is important to find out something about the working style of the hands, for it was this style which directly established their reaction to the work routine.

The employers invariably argued that the native workman was more dilatory and irregular than his English counterpart. From the beginning of the period under discussion, it was stressed that the least cause will keep the ordinary workers away—a puppet show or 'tumashaw' (fun) of any kind within a reasonable distance. And since the wages of 15-20 days were sufficient to support them, it was only "their unfortunate employers who suffered".[30]

The point was again stressed in 1890 by the secretary of the Bengal Chamber of Commerce, Clarke, who made a detailed comparison between the English and the Indian working style in a factory. In England, he observed, factories worked with "highly disciplined regularity of attendance on the part of the workpeople". "Manufacturers in England calculate very closely the effect of silent machinery on the cost of production, and as a consequence the working hands employed in a factory have to yield labour in a fashion which is utterly impossible in India. In England the factory hands are present day by day, and shift by shift, and are kept very closely to their work".[31]

It has been customary to link this dilatory work habit with the rigorous hours that the hands had to keep, to suggest that this, or absenteeism was the hand's way to seek relief from, if not to resist, the long hours.[32] Clarke, on the other hand, felt that the workers could get away with such a style as factory work was only an avocation for them. Their main interest lay at home and in traditional life.[33]

There was, also, a typical charge of apathy. The Industrial Commission, for instance, had noted the complaint of the mill-owners that the hands did not seem to respond to the stimulus of higher wages: they merely worked fewer days in the week.

Yet, it is possible to, and the Industrial Commission actually did, relate this pattern of behaviour with the material condition of the operatives: a state of affairs where extra effort did not promise sufficient benefit to warrant it. As the commission reported: "The reasons for this were investigated in some detail by us. We have little doubt but that the long hours passed in the uncongenial, if not unhealthy, surroundings in a factory, from which the labourer returns at night to a dirty, crowded and insanitary hovel, where his only relaxations are found in the liquour shop and the bazaar are most unattractive to rural life, and it is only the congestion existing in his native district and the desire to earn higher wages *for a time* that lead him to submit to such conditions...[The] conditions under which the labour force lives and works...can never create a skilled and steady class of operatives".[34]

The picture becomes even more damning if we add to this the findings of the Factory Commission of 1908, which discovered a marked absence of elderly people in the textile factories. The conclusion had to be that the hands became incapable of taking the strain of work under the existing conditions at a comparatively early age.[35] We may also note the very acute observations of Rai Sita Nath Bahadur, sercretary, Bengal National Chamber of Commerce, in 1909. He stressed that while it was desirable to examine the physical fitness of workers before employment, "owning to various causes, the standard of health of the poor of this country has been so low that most of them would not be considered eligible, and the consequence would be that the factory would fail to secure sufficient labour...".[36]

III

We have already got a fair idea about the attitude of the state towards the working people in this period. It is important to explore this specially with regard to the existing factory conditions to fully understand the peculiar set up in which they functioned. The main source of information that we have used are the various replies the government of Bengal put up as and when there was pressure for reform in factory conditions. It has to be noted though that until the advent of trade unionism, factory acts, which constituted the main avenues of

state intervention in factories, might not have figured at all in the understanding of workers. In his deposition before the RCL, thus, Adams had observed that as a whole they might not be acquainted with the provisions of the factory act.[17] The security of his job, the regularity and correctness of his pay, were all that immediately concerned the individual worker. Yet official attitude about factory act proposals is important insofar as it was indicative of a general state of affairs, going beyond the specific provisions in a bill and reflecting a milieu in which the hands functioned.

In the early part of the period the identity between the state and the employers was shown time and again. In 1879, when the first bill to regulate factory labour was circulated, the government of Bengal's reaction was quite hostile. It was plainly stated that as far as Bengal was concerned "no case whatever has been made out for special legislation". On a general ground of policy, therefore, any legislation which tended to restrict the growth of manufacturers in India, say, by regulating factory hours, could be nothing but mischievous.[18] This response was in many a sense classic and deserves to be quoted at length, for in many places it put together almost a theoretical formulation justifying the factory conditions as they were:

> In Bengal certainly there are no great town populations of artisans to whom the factory offers the only mode of living, and who require to be protected against the reckless competition of their own class, and the attempts of capitalist employers to get as much work as they can out of them in return for their wages. We have here unfortunately a population almost entirely agricultural subject to a constant risk of famine, to a small fraction of whom manufacturers, for the first time in their history, now offer a means of earning their living apart from the land. If the work is irksome, heavy or distasteful, they can readily leave it; but so long as no serious oppression and no serious evil of any kind are found to exist...(the) government should sedulously avoid all interference which may check the natural expansion of these industries.[39]

The government went on to identify two sources from where the attempt to interefere might have emanated: the "uninformed philanthropists", and the jealous "manufacturers at Manchester and Dundee"; "and nothing could show more clearly that the bill is not really required than the character of the agitation that demands it". The former view the question "entirely from an English standpoint" and so "they publicly express their sympathy with the supposed sufferings of the operatives working in an atmosphere of 90 to 95 degrees for so many hours a day, ignorant all the time that the temperature of the factories is actually less than that of the huts wherein these people would ordinarily live, and ignorant also of the fact that, owing to the dilatory and desultory habits of Indian workmen, the hours of labour are really less by two or three". The Manchester and Dundee interests, on the other hand, had themselves learned by experience the mischief of over-sensitive factory legislation, but yet were anxious to hinder the growth of Indian industries and deprive them "of the natural protection which they enjoy by working unrestricted in the country producing their raw material, with cheap labour, and with a vast consuming population lying at their doors".[40]

The attitude of the government was perhaps most typically demonstrated in the dispute between F Wyer, officiating magistrate of Hooghly, and the commissioner of Burdwan division, Beames. After inspection of Hastings, Champdany and Wellington jute mills, Wyer on May 9, 1882 had reported that while in none of them under-sevens were at work, in none was the Form C being maintained. This Form C dealt with age certificates to be issued by civil surgeons after examining child workers, and Wyer ordered this should be done. At this stage, however, Beames pointed out that Form C became operative only if the inspector thought that a child worker was under age, or if the parents of the child were unable to give the child's age—thereby necessitating an examination. Thus in some factories, there might not at all be an operative Form C as the civil surgeon was not required under the rules to examine every child. Wyer refused to accept this ruling, and in fact held that the commissioner had no right to revise his orders as an inspector. The moot point in the question, according to him, was that "the parents or guardians never, as a rule, know either their own age or that of their children; and to be satisfied with the guess of the manager as to the age of the children would be to nullify the provisions of the act in a very important point".

Beames, after this, forwarded the whole case for the consideration of the superior authorities with the comment that compulsory examination of all child workers would not only be harassing to the managers and the children themselves, but would involve some expense at the rate of 4 as per child examined. His views came to be upheld, and Wyer was rebuked. In a general circular to all commissioners, it was said that the policy of the government was to cause "the least interference with manufacturing which might be consistent with safeguarding the interests of the children employed. Inspectors by making the examination of every children compulsory would give to owners or managers of factories the maximum of trouble and to government maximum of expense without conferring any compensating benefit on the majority of children".[41]

Given this state of affairs, it was not surprising that in 1890, when the question of amending the first Factory Act came up, IJMA almost echoed the Bengal government's position. Almost point for point the same argument was put up against official interference. For instance, there was the same reference about proposed legislations assuming working conditions to be similar in England and India, and that "the feeble manufacturing industries of India" were being subordinated "to the interests of the powerful industries of England".[42]

In the mid-90s, when with the introduction of electric light the question of long hours became prominent, Bengal government again came to the defence of the employers. Against the resolution of Dundee Chamber of Commerce, the government held that not only was the inspection of factories in Bengal perfectly in order, it was in fact better than what it could have been had the inspectors been UK-trained or functioned as required under UK law. For, besides the chief inspector of factories who had his special qualification, the district magistrate and the civil surgeons, who were the other ex-officio inspectors, were definitely of a "higher" intelligence than an ordinary UK-trained inspector was likely to be.[43]

As for night work, which was the main grievance of the Dundee Chamber, it was held to be perfectly legal. For, it was in order to allow women to work by night that the words "except working in shifts approved by the local inspector" were inserted in the act of 1891. What was more, the government insisted that the labouring population actually preferred to work by night. The debate in the council on the bill was quoted to show that "the Indian idea (of night) is that it is a cool and pleasant time when all work which does not require better light than can easily and cheaply be afforded can best be done".[44] To top it, a message from the commissioner of the Patna division, the catchment area from where the substantial portion of the hands came, was tagged along to show how things differed even in the sleeping habits between English and Indian labourers. Thus, "In comparison with an English labourer, the native of India takes far less sleep by night". Again, "while in England the children of the labouring classes are sent to bed early in the evening, in this country the children staying to share the family meal seldom retire to rest until their elders do so". "It must be remembered, too", the commissioner continued, "the labouring classes—dusadhs, gowalas and dhanuks—are accustomed to extreme hard labour from a far younger age than that to which the English labourer is accustomed. In this country a boy or girl of eight or nine years is expected to earn his share towards the family expenses".[45]

In any case, it was not for this that the government of Bengal would not interfere, but because since the act was passed nothing

had happened to warrant any change in the law.[46] Yet we know that in this very case chief inspector Walsh had unearthed disturbing facts about factory conditions which came very close to confirming Dundee's allegations on sweated labour. But since Walsh felt that it would be difficult for night-shift workers to work also during day for any length of time and that it would require mills to be close to each other which was seldom, the government felt it could discount his other findings.[47] Walsh had also quoted a minute of IJMA where most members were shown to be opposed to night work. But about that, the government held that the context was not labour welfare, but the managers' or owners' point of view, and as such may not be the basis for legislation.[48]

Even at the end of another decade, we see almost the same attitude regarding factory hours. The government of India had made enquiries regarding excessive hours for adult males, adequacy of inspection, and defects in the law regarding certification of children. The Bengal government's response was as usual. Playing up certain parts of the reports received from different officials and underplaying or discounting the rest, it opined that "government should not undertake to restrict the hours of adult labour by legislation", for there were no serious abuses. Neither did the workers desire a change in the conditions of labour, and nor was any change necessary for their interest. The labour market was allegedly in such a state that any enforced limitation, if unwarranted, would do "a great deal of harm to the nascent industries of this province".[49]

It may be noted that the chief inspector was, in fact, in favour of indirectly limiting adult male hours by restricting hours of women and children. He agreed with the government that employers and operatives should themselves try to settle the hours. But, as he put it, "I am doubtful" if they could ever do it in view of the bitter competition among the mills.[50]

However, the government felt that if this suggestion was carried too far then women and children might well get ousted from the mill. It was also convinced that no case was made out for any alteration in the law for women and children. There was no systematic evasion so far as clarification was concerned and therefore certification before employment was not necessary either.[51]

The only point on which it would concede any change was in the inspection machinery which was getting palpably short-handed. The existing structure consisting of the district magistrate, the civil surgeon and the chief inspector of factories, was, therefore, to be augmented by the inclusion of an assistant to the chief inspector, and a special medical inspector.[52]

The close alliance between the government of Bengal and Bengal Chamber of Commerce was best reflected in the way the chamber continued to cite government's views to substantiate its own. In 1908, thus, when the Factory Commission brought forward recommendations to revise the Factory Act, IJMA quoted extensively the government's own official to argue why no change was required." The commission, among other points, recommended the formation of a "young person" class for 14 to 17 year olds with a 12 hour day; a six hour day (reduced from seven) for children; prohibition of employment before 5.30 a m and after 7 p m of young persons, children and women, and a compulsory interval after six hours' continuous work in place of the existing mid-day interval. IJMA's response to this was naturally adverse. It said "with as much emphasis as possible", that 90 per cent of the jute mill industry in Bengal was opposed to any alteration or amendment of the Factory Act. The citation from the evidence of H C Streatfield of the government of Bengal followed, showing how the local government had itself anticipated and supported the stand. Streatfield had said:

> It is necessary in the first place to emphasise as strongly as possible the undesirability of undue interference with factory labour in this country. The essential difference between factories in India and in the UK is generally recognised in theory, but in practice often appears to be forgotten. Yet the fact that the labour in the vast majority of factories in Bengal is non-resident and can and does leave a factory the conditions of which are not favourable, and either return to homes in the country or go to another factory, is one which at once renders unnecessary such control as is called for in UK, where operatives often have the alternative of working in the nearest factory or of starving. The habits of Indian operatives as regards the taking of holidays and of intervals in their work, and occasional returns to their homes, the great demand for an inadequate supply of labour, which renders easy terms and liberal wages a matter of course, and the extreme sensitiveness of the labour force to any interference with their settled customs, render it unnecessary and undesirable to insist on strict legal control of the working of the factories. The government of Bengal desires therefore emphatically to assert its opinion that any legislation which is proposed should be of a tentative and permissive character, except as regards matters where practice and not mere theory has shown legislative interference to be called for.

Clearly, thus, there was little change in government's stand on the issue since the days of the first Factory Act. The image of the factory hand, who needed no protection, not only because he himself resented it, but because he was actually a non-resident who did not care much for his job, had become quite stuck in the state's vocabulary. There was yet another aspect to this image, which, while having little to do with the immediate factory conditions, was certainly behind much of the official attitude. It was that of the "cooly" as an almost a lesser human being, who cared only for the direct business of living and nothing beyond that. G D O Maclear, inspector of European schools, thus referred to the ordinary mill 'cooly' as a being of "a very limited mental outlook", "an illiterate, credulous, superstitious individual" whose sole ambition was to earn as much as possible in as short a time so that he might return to his native village for a life of leisure. His children were to him only instruments to achieve this goal and so he admits them into mill work at an early age. "Education does not enter into his cosmos". Therefore, what any education provided for them should hope to achieve was "to produce a more intelligent type of cooly". And the government of Bengal could not agree more with IJMA that education for them should, in fact, remain limited to the three 'R's.[54]

The government's attitude, it is important to understand, permeated its whole hierarchy down to the local official who dealt with the factory relatively at a closer distance. It can be argued that it was first the local official who provided the basic data upon which the state's attitude came to be formulated. Yet we have seen how the higher authorities pulled up a straying official whenever he chose to take a relatively independent position.

The alignment of the local official was evident from the days of the first Factory Act. Bradbury, then sub-divisional officer of Serampore, had observed how the 'coolies' in the mills were in as good a shape as those of the same class outside the mill, if not actually better. In fact, he spoke of their "comparative luxury".[55] This can well be compared with the observations of J M Gillman, civil surgeon of Serampore in 1906, when he said that he had never heard of cases "where operatives have broken down from overwork".[56] Three years later, the incumbent of the same office would write that restriction of hours was not necessary for the condition of labour in the district was "remarkably good".[57]

In other aspects of factory working, again, the stand remained quite the same. On the question of under-age children, for instance, Çollin, the presidency commissioner, in 1906, did not find anything wrong in the fact that the under-age children of the mill hands frequent the mill premises and pick up the work. The fact was they were not employed by the mill. But in any case "there appears to be no special harm in allowing them to come into the mill and learn their work in this way".[58]

As we have noticed, there was a change in the pattern from after the war. The crucial factor was the growing militancy of the

factory worker, which was strikingly evident not only from the growing labour troubles in the mills but also in the emergence of massive political demonstrations in Calcutta with a marked presence of the cooly class. These were, no doubt, indications of more difficult days in the near future. The overwhelming concern of the state now became containment of this threat. The alliance between Bengal Chamber of Commerce and the government of Bengal, therefore, became less obvious than before and on occasion the latter had to step in to formulate, so to say, new rules of the game.

Even in September 1919, warning had come from the chief inspector of factories that conditions for the hands were worsening in the mill areas, and "that a large proportion of these workers are not receiving living wage". The bad trade conditions immediately after the end of the war had led to a four-day week in the preceding eight months, and the workers were receiving four-days' salary and an extra day's pay in the way of 'khoraki', i e, food allowance. The chief inspector foretold serious trouble if things were not soon improved.[59]

The 20s, in fact, opened with massive demonstrations in Calcutta related to the non-cooperation movement in which the participation of the mill hands drew special attention. Besides, there was the strike wave in late 20s affecting much of the industrial belt around the city. The government of Bengal's first response appears to have been the appointment of the Committee on Industrial Unrest in early March 1921. By that time the strike wave was on the wane but the situation was "still sufficiently unsettled to demand the most anxious consideration".[60]

The committee felt that while the industrial turmoil was part of a worldwide phenomenon with all kinds of causes, the most obvious, if not the most important, were the factors related to the economy:

> The increase in the cost of the food-stuffs, cloth and other necessaries of life has been followed by a rise in the wages of all classes of labour, but rise in wages has not at all times and in all industries kept pace with the increase in prices. During the intervals genuine hardship must have been caused to the labouring classes, giving rise to apprehensions as to the future and a general feeling of unrest.[61]

Besides, labour was also rapidly acquiring a political identity. "Public men of all shades of opinion have devoted themselves to the cause of labour..." Labour was "developing a new consciousness of its own solidarity and value". The "placid pathetic contentment of the masses of the people" was gone so far as the Bengal industrial world was concerned.[62]

The decision to set up a machinery for conciliation in industrial disputes, which followed upon the findings of the committee, was definitely a pointer to the changed situation.

The change was even more noticeable when the question of registering trade unions and of offering them some special privilege came. The difference between the respective stands of the government of Bengal and Bengal Chamber of Commerce here becomes specially of interest. The Bengal chamber, continuing on its own inertia, staunchly opposed the inclusion of political action within the scope of trade union function. For while workers could understand "the primary function of trade unions (e g, the regulation of wages, hours of employment and other matters relating to the conditions of work)", they had not yet reached the position "to appreciate the influence of politics on industrial matters". "Indeed, neither the workers, nor their unions, nor the industrial and political developments of the country" were sufficiently advanced to warrant political involvement of the trade unions. Political action by trade unions was recognised as the "most advanced stage of trade union activity in highly organised countries", but then those countries had behind them "the experience of generations of the compulsory education, industrial organisation and representative government". In this country, therefore, a worker may join a trade union to receive the primary benefits from it, but without any further obligation on him to subscribe to the political stand of the union".[63]

The Bengal government, on the other hand, felt that the labour had to be recognised as a political identity. The Committee on Industrial Unrest had recognised that labour discontentment was requisite to its political action.[64] The government of Bengal, following it, argued that inclusion of politics in the trade union's scope had become all the more necessary since the existing system of nominating labour representatives to legislatures could not long survive. As long as what the government of India had proposed was observed, politics by trade unions, it was thought, would be safe enough. This, we may note, took political action to imply electioneering for any public office, distribution of literature, holding meeting, etc, out of a special fund and on the specific approval of the members voting in a secret ballot. Further, members were not to be forced to contribute to the fund.[65]

Again, unlike the Bengal chamber, the government of Bengal held that registration of trade unions should not be made compulsory for the conditions of registration would necessitate minute enquiries into their purposes, organisation and financial position which many of them may not be able to answer. It would be "premature and undesirable" to try to control the activities of trade unions by law. For that "might bring the labour movement into serious conflict with the state".[66]

Subsequently, in 1925, when the question was again discussed, the government of Bengal changed its stress, on inclusion of politics, on the government of India's explanation that even if politics was kept out of trade union's reach, as it eventually was, there was nothing to stop the employees to form a union for political purposes.[67]

Behind all these we should be careful to note, operated the notion of containment. The government of Bengal was not prepared for any change than was warranted by this notion. This was clearly demonstrated in 1922 when the government of Bengal and the Bengal Chamber of Commerce agreed with the government of India that picketing should not be a recognised right of the trade unions.[68] It was again from this standpoint that the Bengal government took a firm stand with the big employers on prompt payment of wages,[69] or on observance of international labour rules.[70]

That all these did not really signify a change of heart may be seen in the question of the Workmen's Compensation Act. The echoes from a previous period about the peculiarity of Indian conditions were prominently heard when the presidency commissioner held that the need for such an act in India was not as much as it had been in the west, for here an injured workman was supported by his relatives. No poor law or anything of the sort was necessary, for the "public prefer to maintain their own poor, who live on the relatives or on public charity, rather than pay a 'poor rate' to maintain a state organisation of poor relief.."[71]

There was also the typical view that employers should not be made as generally liable as in UK in view of the fact that the Indian workmen was more negligent. "If the employer is to be held liable for any accident, there is considerable likelihood of his incurring liability for an accident which could easily have been avoided had the workman not contributed to the accident by his palpable and too often deliberate negligence".[72]

The most characteristic measures of this period, of course, had to do with arbitration in industrial disputes. For the better part of the decade, on this question the closeness between the stands of Bengal Chamber of Commerce and the government of Bengal was evident. In 1920, thus, the latter virtually echoed the Bengal chamber in turning down the idea of a legislation on the lines of the English Industrial Courts Act of 1919. For, it was held that both the capital and the labour were unorganised in the country, and that there was want of authoritative spokesmen on both sides. And, of course, labour in India remained different from that in the west.[73]

By 1925, when the question was again reviewed, there was not much of a change.

It was now conceded that committees of enquiries on disputes were an anathema to the managers. But even if such a stand was untenable, it was held that the government could not support a measure which could make the managers liable to prosecution for having refused enquiry committees.[74]

IV

In a sense what we set out to explore was quite simple. It would have been naive to expect that the colonial state established in India under British rule could have had any objective other than to serve the interests of its own. But having said that, it must also be admitted that imperialism as a historical phenomenon has become unfashionable to recognise. It is almost as if that the event of one nation taking over another was just a passing incident, an accident of history, undeserving of any serious exploration and unworthy of being a premise for any ideological position. At the most, it was a matter of two countries coming together in the normal pattern of international relations. Imperialism, as an exploitative mechanism by which the colonising country sucked the life-blood out of the colonised country for its own benefit, was a non-event. The term 'exploitation' is taken to be sentimental in its thrust, not sufficiently analytical to deserve the attention of the scientific minded academia. You have to, coldly, quantify the amount of surplus value extracted, statistically prove how native industries declined to the benefit of the Lancashire-Manchester lobby, but you may not talk of exploitation. Whatever occurred in the course of colonial rule was only the happenstance of the uninterrupted history of the colonised country, a result of the 'peculiar' nature of the mysterious Orient, or of the unfathomable magic of the Dark Continent, or, to continue with this line of thought, of the uncontrollable passions of Latin America. Time flowed unbroken and the story of colonial oppression, of exploitation, of the consequent immiserisation, was only the delusion suffered by the frustrated peoples of the colonised countries who have somehow failed to make their mark in the modern world. History, in the sense of an account of critical interruptions of time, as an explanation of the present, therefore, threatens to become quite useless.

But for the colonised it is a different story. The present is taken to be the creation of the past, and the past was repeatedly interrupted by historical occurrences. Imperialism constituted the most violent of breaks, because, for the first time, the destiny of the given country was commandeered by another for the sole purpose of exploiting it, to the benefit of the colonising nation. But how does one go about narrating it? It would be worthwhile to recall that the image of factory life which we have just reconstructed is not perhaps, barring in some details, very different, so far as the brutality of life of the factory hands is concerned, from the known image of factories in England in the early days of the industrial revolution. The only difference perhaps lay in the colonial mentality: the impunity with which a white overseer could strike at a 'cooly', or claim a comely wench for his nightly comfort, with the status of the 'huzur-ma-baap' in a sense than was ever true in this hapless country. Strictly speaking, these were extraneous to the factory system, to capitalism. But it was this structure of premises which lent strength to the system, indeed, justified it in the eyes of those who ran it. The lesser people deserved no better, and the old 'koi hais' thought that without it, it would be impossible to keep the natives in check, an attitudinal matrix which helped the system to run smoothly. There is precious little to be gained in arguing that here, in these premises, western colonialism was adjusting itself to the eastern mores, that the huzur-ma-baap syndrome was at the end native to India and not to England. This is besides the point, because adoption of or adjusting to Indian-ness, involved selection of some kind, of exercising a discretion over choices available; which, again, admittedly, would be guided by the wondrous tales of the mysterious east. Choices also involved transfixing of an order, of structuring an ideological mapping of India which would help the future innocent entrants to the maze. By the time the mills were coming up, the habits of the English gods were well set. The map was ready and the mill managers tread upon the paths that were laid down.

This factory system was the end result of all that. Notice, for instance, the report of the Patna divisional commissioner that the sleeping habits of the Indians differed from those of the Europeans, that they actually, therefore, loved to work more at night than during the day. Did it, or did it not, mean that Europeans were creatures of light whereas Indians, being just the other, were denizens of darkness? Also notice the racial arrogance in Maclear's comment, that the ordinary mill 'cooly' was a creature of only a limited mental ability, to whom his children were only tools for earning quick money. "Education does not enter into his cosmos." It was this mentality which made examination of the age of child labour a matter of formality, to be observed only at convenience. It was only later that things began to change, again because it was thought to be convenient for the masters. Colonialism itself began to undergo change. Days of rape and pillage gave way to those

in which control through persuasion and concession became more important, and force was substituted by politics.

A point which finally has to be taken note of is that the sub-, or was it the near-human, Indian cooly never appeared to be unaware of the mesh within which he functioned. Indeed, that alone can explain why invariably labour troubles transcended into violent showdowns with the forces of colonial law and order. It was not only a question of the violence which necessitated police, or even military, intervention. A more rational way of considering it would be to suggest that the roots of violence lay within the system, and the law and order machinery was there to maintain the system. The conflicts with the state implied the truth of the matter, and the labour knew it.

Notes

[I am grateful to a host of friends who have patiently gone through this paper. I would like to acknowledge specially the efforts of Gautam Bhadra, Subhendu Dasgupta, Sudip Choudhuri, Ranjan Ghosh and Lindsay Burnes. The gaps in logic and facts which remain are, of course, my responsibility.]

Total Factor-Productivity Growth in Manufacturing Industry: A Fresh Look

P Balakrishnan

K Pushpangadan

Productivity estimates are sensitive to the measure of real value added that is adopted. One source of bias in estimation is that due to the assumption often made of constancy of the relative price of material inputs. This paper provides estimates of total factor productivity for Aggregate Manufacturing having adjusted for changes in this relative price. These results indicate that, contrary to what is believed, productivity growth in the 1980s may, actually, have been slower than in the earlier decade.

THE best known studies [Ahluwalia 1991 and Goldar 1986] of the growth of productivity in Indian industry have worked with the value added at constant prices as the measure of output. The latter is arrived at by deflating nominal value added by an index of manufacturing prices. Such a measure is valid only if the price of materials relative to the price of output is more or less constant for the period of analysis. When this relative price is changing, estimated productivity would, *ceteris paribus*, vary inversely [Bruno 1984 and Stoneman and Francis 1992]. While the problem has been recognised in at least one study [Goldar 1992], it has never been followed up, in that we are yet to see estimates of productivity in the Indian economy that have taken into account any changes in the relative price of the material input. Perhaps this is due to the enormous data requirements of such an exercise. The present paper makes an attempt to construct a standard measure of productivity for Indian industry having accounted for changes in the relative price of material inputs.

The outline of the paper is as follows. Section I deals with the relevance of the constancy of the relative price of materials to measuring total factor productivity using value added. In this section, the temporal behaviour of raw material prices in India is also examined. In Section II the method of computation of total factor productivity (TFP) is explained, and TFP is estimated from real value added arrived at by the single- as well as the double-deflation procedures. This section also discusses the implication of the results. We conclude with a statement of the limitations of the analysis and with suggestions for further research

I

We here examine how changes in the relative price of material inputs can affect the measure of real value added and thus measured productivity. Assume the case of a single output and a single material input. Value added in current prices is defined as

$$VA_t = P_tQ_t - P_{nt}N_t \qquad ...(1)$$

where 'P' is the price of output, 'Q' is output, 'P_n' is the price of the material input 'N', and 't' is the time subscript.

Real value added can be obtained from (1) in two different ways: the single-deflation method and the double-deflation method, respectively. In the signle-deflation method, both components of value added—the value of output and the value of the input—are deflated by a single price index, i e, that of output. The value added thus obtained will be denoted VASD. As per the double-deflation method, the value of output is deflated by an output price index and the value of input by an input price index. The value added thus obtained will be denoted VADD. From the above definitions, we have:

$$VA(SD)_t = \frac{P_tQ_t - P_{nt}N_t}{P_t/P_0} = P_0Q_0 - \pi_tP_0N_t \ ...(2)$$

where $\pi_n = P_n/P$, and

$$VA(DD)_t = \frac{P_tQ_t}{P_t/P_0} - \frac{P_{nt}N_t}{P_{nt}/P_{n0}} = P_0Q_t - P_{n0}N_t \qquad ...(3)$$

Setting base-period prices to one, the expressions in (2) and (3), respectively, may be re-written as follows:

$$VA(SD)_t = Q_t - \pi_tN_t \qquad ...(2)'$$

$$VA(DD)_t = Q_t - N_t \qquad ...(3)'$$

Now, it is apparent that real value added arrived at by the single-deflation method is not invariant with respect to the current level of the relative price of material inputs. Therefore, in periods of a secular change in this price, the inherent difference between these two measures will widen. In periods when the relative price increases VASD will grow at a rate slower than VADD, while during periods during which the relative price decreases VASD will grow faster than VADD.

The analysis has so far been conducted for the case of a single output and a single input. The conclusions extend to the case of an aggregate of several outputs and several inputs.

A formal expression of the relationship between changes in the relative price of materials and VASD is provided by Bruno [Bruno 1978 and 1984]. Let the aggregate production function for the manufacturing sector be given by,

$$Q = Q(L, K, N) \qquad ...(4)$$

where 'Q' is output, 'L' is labour, 'K' is capital and 'N' is the material input. Real income 'Y' is then defined as

$$Y = Q - \pi_n N \qquad ...(5)$$

TABLE 1: CORRELATION BETWEEN THE RELATIVE PRICE OF RAW MATERIALS AND TFP

Period	Correlation Coefficient
1951-65	-.48**
1959-60 to 1985-86	-.57*

Notes: * Significant at 1 per cent; ** Significant at 5 per cent. TFP is a translog index derived from VA (SD).

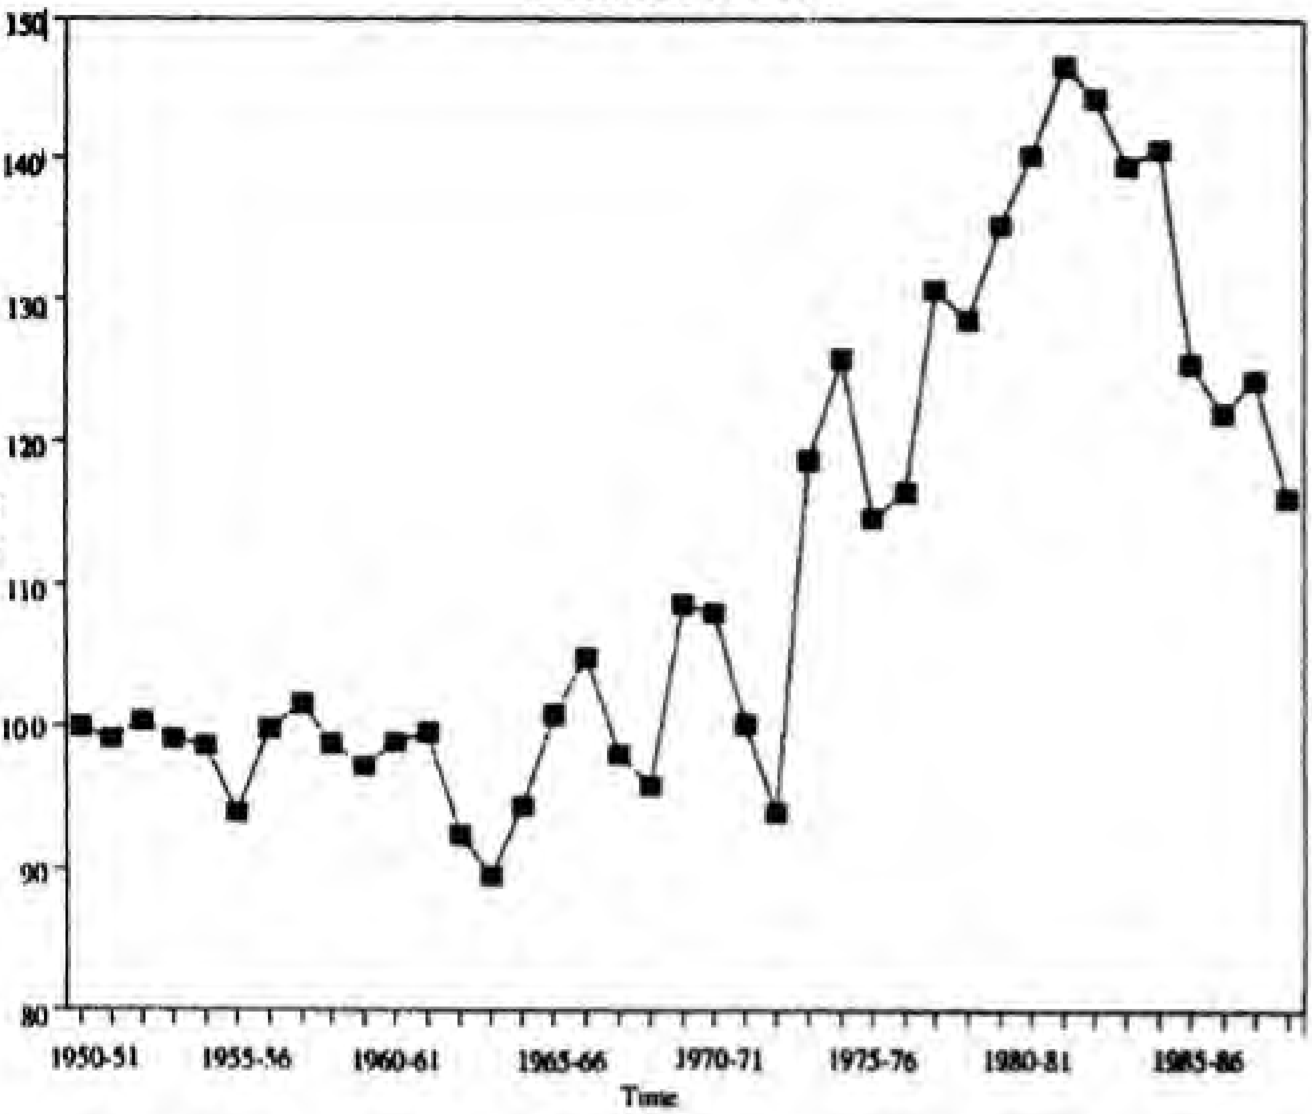
Sources: For the first period estimates by Goldar and for the second those by Ahluwalia have been used.

TABLE 2: VALUE ADDED AND TOTAL FACTOR PRODUCTIVITY

Year	VASD	TFPSD	VADD 1973-74	TFPDD 1973-74
1970-71	100.0	100.0	100.0	100.0
1971-72	99.4	95.7	84.1	79.0
1972-73	103.8	96.8	84.2	76.8
1973-74	99.8	89.9	103.1	90.0
1974-75	108.4	93.4	128.1	105.5
1975-76	110.1	90.2	124.0	96.8
1976-77	122.1	93.6	150.5	108.7
1977-78	131.1	94.8	174.0	118.1
1978-79	152.2	104.9	214.7	137.3
1979-80	146.2	93 6	220.3	131.5
1980-81	136.1	83.0	208.0	117.0
1981-82	150.1	88.3	253.5	135.3
1982-83	172.7	96.4	310.4	154.9
1983-84	189.6	103.1	309.9	148.1
1984-85	195.4	100.8	328.4	146.4
1985-86	202.4	103.4	324.9	139.9
1986-87	202.8	99.1	316.4	129.3
1987-88	221.9	99.9	343.9	128.0
1988-89	252.1	106.8	384.7	133.2

Notes and Sources: 'SD' and 'DD' denote whether the measure has been arrived at by the single- or the double-deflation methods, respectively. '1973-74' indicates that the weights used in the construction of the material-price deflator have been derived from input output statistics for this period.

FIGURE: THE RELATIVE PRICE OF RAW MATERIALS
(Index: 1950-51 = 100)



productivity increase without any increase in the efficiency of input use.

The analysis clearly shows that the productivity measure derived from VASD is biased when the relative price of material

where $\pi_n = P_n/P$ = price of materials/price of output.

Under optimising behaviour, the marginal value product of the material input must be equal to its price and real income may now be written as,

$Y = Y(L, K; \pi_n)$ ...(6)

In order to bring out the effect of a change in the relative price of the material input on value added, express (6) in growth rate form. Differentiating (6) with respect to time

$$\frac{dY}{dt} = \frac{\delta Y}{\delta L}\frac{dL}{dt} + \frac{\delta Y}{\delta K}\frac{dK}{dt} + \frac{\delta Y}{\delta \pi_n}\frac{d\pi_n}{dt} \quad ...(6a)$$

Under profit maximisation,

$$\frac{\delta Y}{\delta L} = \frac{w}{P}, \; \frac{\delta Y}{\partial K} = \frac{r}{P}, \; \frac{\delta Y}{\partial \pi_n} = -N \quad ...(6b)$$

where 'w' is the wage rate of labour and 'r' is the rental rate of capital.

Substituting the above marginal conditions in equation (6a) and expressing it in growth rate form yields (see Appendix B).

$$\dot{y} = (1-\beta)^{-1}(\alpha\dot{l} + \tau\dot{k}) - (1-\beta)^{-1}\beta\dot{\pi}_n$$
$$= (1-\beta)^{-1}(\alpha\dot{l} + \tau\dot{k}) - b \quad ...(6c)$$

where

α = share of labour input in the value of output,

τ = share of capital input in the value of output,

β = share of material input in the value of output, and

$b = (1-\beta)^{-1}\beta\dot{\pi}_n$.

Bruno refers to '$-b$' as the 'technical regress' term. The effect of the technical regress, itself a function of the change in the relative price, on total factor productivity (TFP) is seen below. The first term on the right hand side of equation (6c) is the growth rate of net output due to primary factors, labour and capital. Let it be denoted by $\dot{v}$.

Rearranging (6c)

$$\dot{v} = \dot{y} + b \quad ...(7)$$

Equation (7) brings out the impact of the relative price of materials on productivity through its effect on measured real net output.

Three such effects can be identified.

Case 1: the relative price is stable, i e, $\dot{\pi}_n = 0$. In this case, $b = 0$, both net output due to primary factors and the real income, which is VASD, are the same. Hence there is no relative-price-effect on measured productivity growth.

Case 2: the relative price increases, i e, $\dot{\pi}_n > 0$. In this situation, the net output increase due to primary factors is underestimated if VASD is used. The underestimation is proportional to the rate of change of the price of raw materials. This itself can show up *ceteris paribus* as a decline in measured productivity without there actually having been a change in the efficiency of production.

Case 3: the relative price decreases, i e, $\dot{\pi}_n < 0$. In this situation, the growth in the net output due to capital and labour is overestimated if VASD is used. In fact, the estimate needs to be adjusted downwards for the decline in relative prices. This upward bias will show up ceteric paribus as a

TABLE 3 TESTING FOR A TURNAROUND IN TFPG

	I	II	III
Constant	4 56	4 33	4.33
	(134 0)	(61.56)	(64.0)
Trend	0002	0.05	0.08
	(0.03)	(4.78)	(6.92)
D_1	–.33	0.60	1.01
	(3.23)	(2 79)	(4.89)
D_2	.02	–0 06	–0.10
	(2.82)	(3.17)	(5.50)
R^2	.50	80	.87
D-W	1 39	.1.46	1 41

Notes: The estimates are from a semi-log trend equation for TFP. T=1970-89, D_1 and D_2 are dummies that test for a change in the level ('Constant') and the rate of growth ('Trend'), respectively, for the period starting 1980. I, II and III differ in the dependent variable: TFP having been derived from different measures of real value added 'I'; TFP (SD), 'II' and 'III': TFP (DD) 'II' uses weights from the input-output for 1973-74 and 'III' from 1983-84. (T-ratios in parentheses.)

TABLE A1: PRICES OF OUTPUT AND INPUTS

Year	Index of Manufac-turing Prices	Index of Material Prices	Index of Relative Price of Raw Material

1988-89	414 4	492.8	116 1

inputs changes. The problem is serious only if the relative price of materials actually does fluctuate. To seek empirical evidence on this requires the construction of price index of raw materials. It is so because the price of inputs into manufacturing is some weighted average of the prices of produced inputs and of raw materials. Naturally, the relative price of the produced inputs, since they originate from 'Manufacturing', would be expected to vary much less. The price index of raw materials is defined as the weighted average of the wholesale price index of food products, non-food crops, minerals, and fuel and power. The weights are derived from the input-output table for the year 1973-74. The wholesale price index (1950-51 = 100) of manufactures published by Central Statistical Organisation (CSO) is taken as the output price index [see Appendix A]. The relative price, the ratio of the price index of raw materials to that of manufactures, is graphed in the Figure.

Notice the stability in the relative price during the 50s, the fluctuation without any trend in the 60s, the fluctuation around an increasing trend in the 70s, and the fluctuation around a decreasing trend in the 80s. There-fore, assuming constancy of the relative price of raw materials would be inappropriate. This would imply that measured productivity is affected by the relative price movement if VASD is used for measuring the output especially for the period since the 60s. If the inverse relationship is valid, then one would expect a negative correlation between the relative price of raw materials and TFP derived from VASD. A preliminary test of the hypothesis is conducted using TFP from two well known studies of productivity growth in Indian manufacturing industry. We have computed the correlation coefficient between the relative price of raw materials and the translog index of TFP given in Goldar (1986) and Ahluwalia (1991). These are presented in Table 1.

Note that the correlation coefficient is significant and of the expected sign. The relationship seems to be stronger during the second period. It is to be noted from the Figure that the fluctuation in the relative price is more during 1959-60 to 1985-86 than that during the period 1951 to 1965. These findings together suggest that productivity estimates for Indian manufacturing industry need to be adjusted for changes in the relative price of inputs.[1]

II

Conventionally, productivity is measured by the average product of a single input, usually labour, over a period of time. It has been increasingly accepted that technical progress is the result of efficiency improvements across-the-board rather than in the use of a single input. Therefore the proper measure is the average product of all inputs. This has been called total factor productivity (TFP) or multifactor productivity. By definition,

$$TFP = \frac{Q}{X} \quad ...(8)$$

where 'Q' = output and 'X' = a weighted index of all inputs.

The total factor-productivity growth (TFPG) is given by the time derivative of (8) expressed in growth rate form,

$$TFPG = \dot{q} - \dot{x} \quad ...(9)$$

$$\text{where } \dot{q} = \frac{d\ln Q}{dt} \quad \dot{x} = \frac{d\ln X}{dt}$$

In order to compute the TFPG, then, we should express the growth rate of output and the growth rate of inputs in observable quantities. This is obtained from the use of production theory and optimising behaviour. For this purpose, assume a stable relationship between output, input and time.

Table A2: Book Value of Fixed Assets in Manufacturing Industry, 1960

Source: Annual Survey of Industries, 1960, Vols 1-10

$$Q = Q(X, t) \qquad ...(10)$$

where 'Q' stands for output, 'X' for a vector of 'n' inputs, and 't' for time. The rate of technical progress, TFPG, is then defined as

$$TFPG = \frac{\delta \ln Q(X, t)}{\delta t} \qquad ...(11)$$

Differentiating (10) with respect to time and expressing it in growth rate form;

$$\frac{d\ln Q}{dt} = \sum_{i=1}^{n} \epsilon_i \frac{d\ln X_i}{dt} + \frac{\delta \ln Q(X, t)}{\delta t}$$

where $\epsilon_i = \frac{(\delta Q/\delta X_i)}{(Q/X_i)}$ is the elasticity of output with respect to the ith input. From the above we have:

$$TFPG = \frac{\delta \ln Q(X,t)}{\delta t} = q - \sum_{i=1}^{n} \epsilon_i \dot{x}_i \qquad ...(12)$$

where $\dot{x}_i = \frac{d\ln X_i}{dt}$

Expression (12) may be used for the measurement of TFPG only if the elasticity of output with respect to each input is known. But, under profit maximisation, the elasticity of output with respect to an input is equal to its share in value of output. That is, under profit maximisation:

$$P(\delta Q/\delta X_i) = P_i$$

Therefore, after substitution, we have:

$$\epsilon_i = \frac{(P_i/P)}{(Q/X_i)} = \frac{P_i X_i}{PQ} = s_i$$

where 's_i' is the share of the ith input in the value of output. Expression (12) can therefore be re-written as:

$$TFPG = \dot{q} - \sum_{i=1}^{n} s_i \dot{x}_i \qquad ...(13)$$

The second term in equation (13) is a Divisia index. The difficulty in using equation (13) is that it is applicable only to data generated continuously. But economic data come in discrete form. Therefore an approximation to (13) in discrete form is needed. The following approximation has been suggested for the use of discrete data [Chambers 1988: 233]

$$TFPG = (\ln Q_t - \ln Q_{t-1}) - \sum_{i=1}^{n} \tfrac{1}{2} (s_{i,t} - s_{i,t-1})(\ln X_{i,t} - \ln X_{i,t-1}) \qquad ...(14)$$

Expression (14) is referred to as the Divisia-Tornqvist approximation for the calculation

of TFPG. All the variables in equation (14) are observable and thus TFPG can be calculated.

The focus of this study is the importance of correcting for changes in input prices when computing TFP. As was stated earlier, when we are concerned with Aggregate Manufacturing the crucial relative price would be that of raw materials. However, the data on the manufacturing sector in the Indian economy (ASI) provides only the value of material inputs as a whole. Hence for the empirical exercises that follow we have used a price deflator that combines the price of all inputs, produced inputs and raw materials.

Total factor productivity growth for alternative definitions of the aggregate value added in Indian manufacturing industry has been computed using (14). From the results of this exercise index numbers of TFP are derived and presented, along with the two measures of value added, in Table 2.

Since this study is motivated by the argument that appropriate measurement of productivity requires commencement from estimates of value added adjusted for changes in the relative price of material inputs, we focus on the difference in estimated productivity arrived at by the single-deflation and the double-deflation methods, respectively. In particular, these estimates have a bearing on an hypothesis propounded in a widely-received recent study of the growth of productivity in Indian manufacturing industry. Ahluwalia has argued that there has been a turnaround in total factor-productivity growth since 1980. We quote: "As the rising fiscal deficits in the eighties created resurgent demand conditions, the reorientation of the policy framework and the toning-up of the infrastructure sectors enabled a supply response to the rising demands through productivity improvements" [Ahluwalia 1991: 137]. The evidence presented in this study provides for a plausible explanation of the observed phenomenon. That is, we are able to confirm a "turnaround" in productivity growth when we focus on the estimates of TFP derived from the VASD series. In this sense we are able to replicate Ahluwalia's finding. The point, however, is that what we consider to be a more appropriate measure of real value added yields a quite different account for productivity growth. It is interesting that such a possibility had been raised [see Lahiri: 1992]. It is confirmed by the statistical exercise reported in Table 3. This exercise involved a statistical test for a change in TFP growth since 1980 using the two measures of TFP reported in Table 2. The procedure, based on the use of dummy variables to test for a shift in the slope of the trend equation, is identical to that used by Ahluwalia. Note that these results indicate a higher growth of TFP since 1980 when VASD is used but not so when VADD is used.

The input-price deflator used to arrive at VADD is based on input-output coefficients for the manufacturing sector of the Indian economy. In Table 2 the estimates of VADD, and therefore TFP (DD), uses coefficients drawn from the transactions table for 1973-74. The sensitivity of the estimates of value added to the input-output coefficients used as weights in the construction of the input-price deflator, using the input-output coefficients drawn from the input-output table for 1983-84, was now examined. The findings, with regard to both VADD and the growth of TFP, remained unchanged. So the figures are not reported in the text. However, the estimated TFP was used in the statistical exercise reported in Table 3. The finding with regard to the absence of an increase in the growth rate of TFP when VADD is used is confirmed.

We do not take the view that the measure of total factor-productivity growth in Indian industry that has been adopted here is ideal. While it makes a distinct improvement over those measures that have been provided so far, it does in turn require correction for capacity utilisation and the existence of a mark-up over marginal cost. These considerations constitute the next item on our research agenda.

Appendix A

(1) *The Period of Study*

The period of this study was chosen on the basis of the following considerations: the data availability and the behaviour of the relative price of raw materials. The relative price of raw materials, plotted in the Figure, is more or less stable during the period till the late 1960s. Therefore, the period of study is restricted to 1970-71 to 1988-89. The ASI has not published its annual survey for the year 1972-73. For continuity, the values of 1972-73 were estimated as a simple average of figures for 1971-72 and 1973-74.

(2) *Value Added*

Gross value added has been used. In the case of VASD this figure has been deflated by the index of the price of output. In the case of VADD, the value of inputs is deflated by the price of inputs and the resulting value deducted from real output (nominal output deflated by the price of output). Thus the computation of VADD requires two price indices, those for the price of output and the price of material inputs, respectively. The wholesale price index of manufactures (1970-71 = 100) is treated as the price of output. The material price index is a weighted index of the wholesale prices of major input groups, the weights having been calculated from the matrix of input-output transactions published by the Central Statistical Organisation. Inputs were grouped according to the availability of wholesale price indices that could be used to represent them most closely. The implied weights were now used to construct a weighted average input price. The weights assigned to the wholesale price index for the input groups were as follows:

Input Group	Per Cent Share 1973-74	Per Cent Share 1983-84
'Food articles' (01)	1.16	1.09
'Non-food articles' (02-04)	32.45	18.31
'Egg, fish and meat' (05 and 07)	3.47	3.02
'Logs and timber' (06)	1.48	2.49
'Coal mining' (08)	0.93	2.22
'Minerals' (09-11)	5.78	10 64
'Food products' (12-13)	4.19	4.01

The value of output and the value of input is taken from the following sources: 'Wages and Productivity in the Organised Manufacturing Sector, 1960-61 to 1976-77', Central Statistical Organisation (1979), and *Annual Survey of Industry*, various issues.

The relevant prices are presented in Table A1. Other variables used in the construction of value added, by single- and double-deflation methods, are presented in Table A7. Value added is presented in Table 2.

(3) *Capital Stock*

The estimation of the capital stock is a controversial issue both in theory and in practice. The issues are very familiar; therefore, we do not enter into a discussion.[2] We follow the standard practice of the perpetual inventory method for the generation of a capital stock and assume, as is widely done, that the services of capital are proportional to its stock. The perpetual-inventory method requires an estimate of the capital stock for a bench-mark year and estimates of investment in the subsequent periods. As was done in the earlier studies, especially that of Goldar and Ahluwalia, we too have selected 1960 as the bench-mark year for the estimation of the replacement cost of fixed capital. This is solely due to the availability of data on the book value of fixed capital in 1960 for most of the industries for which Hashim and Dadi (1973) provide the ratio of purchase value to book value (referred to as gross-net ratios) of capital. Hashim and Dadi have estimated these gross-net ratios for fixed capital after analysing the balance sheets of about 1,000 firms covered in ASI. For our analysis, total fixed capital (excluding the intangible assets) were grouped into the following: (1) land and improvement of land, (2) building and construction, (3) plant and machinery, and (4) transport and other fixed assets. The gross-net ratio for the land is assumed to be unity. For the other three groups the GNR is taken from Hashim and Dadi (1973, Table III.1). Where the gross-net ratio is not given by Hashim and Dadi, we have taken it to be twice the book value of fixed capital.[3] After estimating the gross value of the fixed capital at purchase price for the factory[4] sector in 1960, the following adjustment was made to account for the age structure of the assets. Hashim and Dadi provide the gross value of capital purchased during the period 1901-1945 and in each remaining year until 1960. This proportion is applied to the gross value of fixed capital in 1960 to obtain the yearwise value of fixed capital bought in the past. To adjust for age-structure, the estimate for each year is then inflated using the current-to-purchase price ratios given in Table A4 to obtain the gross value of fixed capital at replacement cost in 1960 prices.

The investment figures were obtained using the formula:

$$I_t = (B_t - B_{t-1} + D_t) / R_t$$

where 'B' is the book value of the fixed capital, 'D' is depreciation, and 'R' is an appropriate deflator for fixed capital. For 'R' we have used the wholesale price index of machines and machine tools (base 1960-61=100). The capital stock at any year is then calculated as follows:

$$K_t = K_0 + \sum_{t=1}^{T} I_t$$

where 'I_t' is investment in year 't' in 1960 prices and 'K_0' is the capital stock in the bench-mark year in 1960 prices.

However, there was a problem of calculating the capital stock in the manufacturing sector *per se*. Recall that 'manufacturing' is 'all industries' minus 'electricity, gas and steam'. Given our choice of the bench-mark year as 1960, in order to arrive at the capital stock in 1970, we require data on the value of fixed capital in 'electricity, gas and steam' for the period 1960-61 to 1969-70. This information is available for the Census sector but not the Sample sector. Therefore the fixed capital in the manufacturing sector during the period includes the fixed capital of the firms in the 'electricity, gas and steam' segment of the Sample sector. There is hardly any firm producing electricity in Sample sector. But there exist firms in the Sample sector producing gas and steam. As a result, our estimate of investment in the manufacturing sector during the period 1960-61 to 1969-70 would be an overestimate. However, we do not consider this to be a serious problem.

Data used at various stages in the calculation of the capital stock series are presented in Table A2 to A6.

Sources:

Book Value of Capital: *'Wages and Productivity in the Organised Manufacturing Sector, 1960-61 to 1976-77'*, Central Statistical Organisation (1979), and *Annual Survey of Industry*, various issues; 'Index of the Price of Machinery and Machine Tools'—*India Data Base* and 'Index Numbers of Wholesale Prices' Ministry of Industry.

(4) *Labour*

Total employment is used. The data is presented in Table A7.

Sources: 'Wages and Productivity in the Organised Manufacturing Sector, 1960-61 to 1976-77', Central Statistical Organisation (1979), and *Annual Survey of Industry*, various issues.

(5) *Factor Shares*

Note that the use of (14), the Divisia-Tornqvist approximation to total factor productivity growth, requires knowledge of the share of each primary factor in the value added. For VASD, the share of total emoluments in the value added is taken as the share of wages. But for VADD, the share is defined as the ratio of real emoluments to VADD. Assuming constant returns to scale, the capital share is got as one minus the share of wages.

TABLE A 7

Year	Value of Output (Rs Lakh)	Material Inputs (Rs Lakh)	Emoluments (Rs Lakh)	No of Employees	Capital Stocks (Rs Lakh)

Appendix B

$$\frac{dY/dt}{Y} = \frac{wL}{PY}\frac{dL/dt}{L} + \frac{rK}{PY}\frac{dK/dt}{K} - \frac{\pi_a N}{PY}\frac{d\pi_a/dt}{\pi_a}$$

$$\dot{y} = \frac{wL}{PY}\dot{l} + \left(\frac{rK}{PY}\right)\dot{k} - \left(\frac{\pi_a N}{PY}\right)\dot{\pi}_a$$

where:

$$\frac{wL}{PY} = \frac{wL}{P(Q - \pi_a N)}$$

$$= \frac{wL}{(PQ - P_a N)}$$

$$= \frac{(w.L / PQ)}{(1 - P_a N / PQ)}$$

$$= \frac{\alpha}{(1-\beta)}$$

where α = share of labour in the value of output and

β = share of material inputs in the value of output.

Similarly, we can show that

$$\frac{rK}{PY} = \frac{\tau}{(1-\beta)} \text{ and } \frac{\pi_a N}{PY} = \frac{\beta}{(1-\beta)}$$

where τ is the share of capital in the value of output.

Notes

[We thank M Suresh Babu, Dennis Raja Kumar and Geoji Thomas for excellent research assistance. We are grateful to Sanjit Bose, Dipankar Dasgupta, S Gangopadhyaya, B N Goldar, Prabhat Patnaik, Bharat Ramaswami, Abhijit Sen, K Sundaram, A Vaidyanathan and, above all, to Kirit Parikh for comments which contributed to more robust results. The usual disclaimer applies.]

1 Goldar discusses this bias in the single-deflation method, but does not proceed with double deflation. See Goldar (1992), p 15.

2 An excellent survey of the literature is given in Goldar (1986) and in Hashim and Dadi (1973).

3 Goldar (1986) provides some evidence why this would be a reasonable conversion factor.

4 All the preceding exercises were undertaken only for the census sector since the breakdown of assets (according to categories such as land, building, etc) in the sample sector was not available to us. The ratio of the value of fixed capital at replacement cost to its book value in 1960 (2.42) was used to arrive at an estimate of fixed capital at replacement cost in this sector. The figures for the census and sample sectors were aggregated to arrive at the figure for the factory sector.

Theories of the Soviet System

A Retrospective Critique

Mangesh Kulkarni

This article examines the larger political implications of the Soviet disintegration through a retrospective analysis of the various theories of the system.

"The owl of Minerva takes flight as darkness falls".

—G W F Hegel

THE disintegration of the Soviet Union in December 1991 was an event of truly epochal significance. It represented not merely the fall of a regime, but the collapse of a unique socio-economic and political system, which had for long nursed the ambition of refashioning the world in its own image. For this reason alone, a retrospective examination of various theories of the system would be of considerable historical interest. Political scientists, however, have additional reasons for conducting such an exercise. One of them is to understand how 'ideology' and 'science' interact to create different constructs of a political phenomenon. Another, is to gauge the larger political implications of the event through a better grasp of *what* collapsed in the Soviet Union. This paper seeks to pursue both these kinds of inquiry, with the advantage of hindsight—the first at considerable length, and the second very briefly towards the end.

During its life-span of nearly seven and a half decades, the Soviet Union attracted a host of theorists, driven by scientific ambitions as well as ideological predilections. The massive literature generated through their endeavours may be broadly divided into two categories, (a) Sovietological perspectives, and (b) Left perspectives. The first of these emanated from the academic study of the Soviet Union in the west, while the second prevailed among Marxist intellectuals and communist circles. It may be noted that the Indian debate on the nature of the Soviet system has occurred largely in terms of these perspectives, but cannot be said to have thrown up major theoretical insights. Let me close these introductory remarks by explaining the sense in which the term 'theory' is used in this paper. A theory of the Soviet system, in this sense, is an intellectual construct facilitating a proper understanding of the structure and functioning of the system and directing attention to the sources and possibilities of systemic change.

Sovietological Perspectives

Sovietology was taken to encompass "...the study of all matters that help us to understand the meaning of current, politically significant Soviet-communist behaviour and to forecast its future course" [Adams 1970, p 38]. It was no coincidence that as an academic discipline, Sovietology was most thoroughly institutionalised in the US, which led the anti-Soviet coalition in the post-second world war era. As such, it also formed part of a larger, hegemonic social science discourse. A critique of Sovietology can thus yield insights into the global relations of power/knowledge prevailing in this period. (This section presents a modified version of Kulkarni 1993.)

The first significant and influential Sovietological theory was formulated in the mid-1950s by Carl Friedrich and Zbigniew Brzezinski (1965, p 22). They described the Soviet Union as a totalitarian system. The term 'totalitarianism' had already been used by scholars like George Sabine and Hannah Arendt to highlight the historical novelty and similarity of Nazism and Soviet communism [Schapiro 1972, pp 13-15]. Friedrich and Brzezinski spelt it out in terms of the following features: a comprehensive official ideology bent upon world conquest, a single mass party led by a dictator, institutional terror, a monopoly of information, and a centrally controlled economy.

A highly schematic depiction of the Stalinist regime, the totalitarian construct ironically gained popularity at a juncture when this regime was undergoing a major transformation in the direction of deregimentation. However, Sovietologists soon realised that the theory was too wooden to serve as an analytical tool for explanation and prediction. It ignored several major contradictions within the system: centralised co-ordination of social transformation generates disorder, total congruence between the interests of the leadership and the party does not obtain for long, no system of governance, howsoever rational and elaborate, can ever exhaust or permanently control social reality. The theory failed to capture the system's dormant and incipient pluralism, its shift from arbitrary terror to the institutionalisation of norms, and the growing complexity of the policy process. Consequently, it could not anticipate the imminent Khrushchevian thaw [Hough and Fainsod 1979, pp 519-23].

Thus, by the end of the 1950s the totalitarian construct had lost its pre-eminent position in Sovietological discourse. But it was not completely discarded. It survived alongside and often underpinned the new theories that came to be advanced (for a recent revival of the theory see, Malia 1992, pp 89-106). Among these were theories which viewed the Soviet Union as a 'directed society' controlled from above by a self-appointed bureaucracy [Hough and Fainsod 1979, p 523]. They modified the totalitarian construct by incorporating in their schema certain obvious changes in the Soviet system, such as greater rationality, less rigidity, and less reliance on terror. As such, they offered only a slight improvement over their prototype, in terms of descriptive adequacy.

Theories viewing the Soviet Union from a developmental angle constituted a further departure from the totalitarian construct [Cornell 1970, pp 16-22]. One strand placed the USSR in the category of 'developing societies' of the third world, by emphasising shared concerns such as the need to achieve rapid economic growth, nation-building in the face of great diversity, the spread of education, and scientific/technological modernisation. Another strand located the Soviet Union in the spectrum of 'industrial societies' exemplified by the developed western countries. These apparently antithetical systems were seen to be converging along the following dimensions: increasing diffusion of power, greater equality of opportunity and social mobility, primacy of pragmatism over utopian ideology, institutionalisation of legal norms, bureaucratisation, urbanisation, and inter-ventionist government.

While the earlier theories had stressed the uniqueness of the Soviet system, the developmental theories highlighted the similarities between a certain set of non-communist societies and the Soviet society in terms of significant socio-economic and political indices. Though this was an advance, a one-sided accent on commonalities tended to obscure the specificities of the Soviet system. Moreover, very often the comparisons were dubious and misleading, not to say inconsistent, as is evident in the radical divergence between the above-mentioned strands.

Efforts to provide finely textured accounts of what was seen as an increasingly complex, rule-governed and stable Soviet system, resulted in the popularity of pluralist theories in the post-1970 period [Hough 1977, pp 10-12, 22-24]. They drew attention to the relative autonomy of major groups in the system, such as the specialised ministerial-party-scientific complexes, the discussion of a wide range of policy alternatives in the press, interest representation by specialised figures within a broadly defined 'leadership echelon', and

the spread of a bargaining mentality among the political and administrative actors.

The pluralist theories were extensions of theoretical frameworks originally intended to explain the distribution of power and the nature of policy-making in the American political system. They were predicated upon an advanced market economy, an open and sophisticated civil society and a liberal democratic polity. Consequently, while the pluralist theories did shed light on certain aspects of Soviet governance, and pointed out interesting parallels between communist and capitalist polities, they were not able to capture adequately the laws of motion of the Soviet system. It is no wonder that they were unable to forecast or explain the imminent collapse of the system. This is also true of the eclectic theories which came to characterise Sovietology in the 1980s [Lane 1985, pp 313-14].

We may now turn to a consideration of how Sovietological theorisation was enmeshed in the international and domestic politics of the US. Like the larger social science discourse from which it derived, Sovietology too was driven by the two-fold ambition of attaining 'global' validity and providing inputs to the policy elites. The former resulted in clumsy attempts to stretch homegrown theories like pluralism to fit the Soviet system, while the latter led to complicity in the ideological predilections and political designs of the establishment.

Sovietological theories constituted a rich repertoire which the American ruling elite could use for ideologically fine-tuning the necessary modulations of the US-Soviet 'controlled conflict'. Thus, at the height of the cold war in the 1950s, the Soviet Union could be maligned as a totalitarian monstrosity. During detente, when it was necessary to grant a certain legitimacy to the Soviet system, the pluralist construct could be invoked. The continued usefulness of the totalitarian construct lay in the fact that it came handy for distancing the Soviet Union, and even more, for damning it, as during Reagan's first term.

Sovietology also indirectly bolstered US policy towards the third world. A version of the developmental theory treated the Soviet Union as a 'developing country'. One function of this theory was to warn the third world countries of the perils of embarking upon a non-capitalist path of development—along this path lurked the danger of totalitarianism. It also sought to alert the American policy elites to the conditions under which a developing country might turn to communism, and to the need for pre-emptive measures.

Jean Kirkpatrick, political scientist, conservative ideologue and former US ambassador to the UN, argued that only pro-capitalist, authoritarian regimes could keep communism at bay in the third world. Moreover, these were morally superior to and more amenable to eventual democratisation than their totalitarian, read communist counterparts [Kirkpatrick 1979]. This was an ingenious and elegant theoretical justification of the American policy of supporting friendly third world dictators, in the name of making the world safe for democracy.

Sovietology as demonology also entered into the official American legitimating ideology. Any radical questioning of the capitalist system was blocked by projecting the inequalities and alienation generated by the system as the inevitable costs of political freedom and of an open society—the only alternative being a Soviet-type totalitarian society. Ironically, the US itself has been castigated by critics like Herbert Marcuse as a totalitarian society for its proclivity to the suppression of all challenges to the status quo [Schapiro 1972, p 106].

Left Perspectives

What left-wing theories have in common is a certain attachment to the project of socialism and a recourse to Marxism as a source of theoretical insights. But even these apparent commonalities have given rise to a great deal of divergence as socialism and Marxism have been variously interpreted from different theoretical standpoints. Unlike Sovietology, these theories cannot be situated within a single political terrain as their links with specific states have been variable, tenuous or in some cases simply non-existent. This is because many of them have emanated from dissident intellectuals and marginal political groups. We can, however, arrange them in a spectrum in terms of their distance from the theoretical self-description of the former Soviet Union.

The pre-Gorbachev Soviet state viewed itself as an embodiment of 'developed socialism'—a stage in socialist construction between the revolution and full-fledged communism. The Soviet Union was claimed to have entered this stage in the 1960s, and the Constitution of 1977 proclaimed that a developed socialist society had been built in the USSR [Klementyev and Vassilyeva 1986, pp 50-55]. The mode of production was said to be fully socialist, being based on social ownership and management of the means of production. Rational, need-based planning and high productivity, as also, distribution of the social product in proportion to the work contributed, were cited as significant achievements on the economic plane. It was declared that the well-being of the people was constantly rising, and increasingly favourable conditions were being provided for the all-round development of the individual.

The Soviet Union had purportedly created a new historical community by drawing together all classes and social strata, and further, by safeguarding the juridical and factual equality of all its nations and nationalities which maintained fraternal co-operation. The Soviet society was described as one characterised by high organisational capacity, ideological commitment, and true democracy. The democratic character of the society, it was claimed, found expression in a political system which ensured effective management of all public affairs, ever more active participation of the working people in running the state, and the combining of citizens' real rights and freedoms with their obligations and responsibility to society. The chief goal of the leadership was to secure a steady and all-round improvement of socialism, further to advance Soviet society towards communism on the basis of accelerated socio-economic development of the country.

The flaws in this self-congratulatory account were so obvious and glaring even before the collapse of the Soviet Union, that even in the Left camp, none except the most uncritical admirers of the USSR honestly and fully subscribed to it. The economic claims made in this account were seen to be exaggerated in view of the chronic shortage of consumer goods, dependence on agricultural imports and a considerable technological lag which in fact plagued the Soviet economy. Similarly the socio-political claims were belied by the prevalence of widespread, multifarious inequalities among various strata and regions, denial of civil liberties, and the dictatorship of the communist party.

Many Left intellectuals were, however, willing to grant the Soviet Union its title to socialism, with the proviso that it be viewed as an imperfect realisation of the socialist ideal. The well known East German dissident Rudolph Bahro expressed such a view in a widely debated book *The Alternative in Eastern Europe* (1978). Bahro held that Stalinism was both inevitable and progressive. A strong, even dictatorial leadership was required to drive the Soviet masses into industrialisation so as to create the material pre-conditions of socialism. After this task was achieved, the Stalinist politbureaucracies, having outlived their role, became an obstacle in the fuller development of socialism.

Bahro called for a 'cultural revolution' to break the Soviet impasse. The revolution would be led by a league of communists articulating the emancipatory interests of all people in all social strata. If successful, it would result in the setting up of a federative, decentralised society of the sort envisioned by Marx. Bahro's glib justification of the Soviet regime's Stalinist past, his failure to question its socialist pretensions, and his inability to perceive the deep-rooted socio-economic contradictions besetting the system, reveal the shallowness of his analysis. This seems particularly damning as deeper critiques of the system were available when Bahro wrote his treatise.

Among the earliest of such critiques was Leon Trotsky's *The Revolution Betrayed*, originally published in 1937, after his disagreement with and subsequent expulsion by Stalin. Trotsky described the Soviet state as a 'degenerated workers' state'. Some basic

gains of the Revolution, such as socialisation of the means of production, had survived. But a parasitic bureaucracy had emerged and taken hold of the state apparatus. It had become a privileged caste with a disproportionate share of power, status and material rewards. He viewed the Soviet order under Stalin as an unstable, transitional formation, between capitalism and socialism. It could regress into capitalism. A forward march to socialism would require revolutions in the advanced capitalist countries as also a political but not social revolution in the Soviet Union to restore a genuinely proletarian regime.

Despite the brilliance of Trotsky's critique, it must be seen as being inadequate. The political revolution it envisaged was restricted to the reintroduction of inner-party democracy within the Soviet communist party. There was no thoroughgoing interrogation of the basic institutional structure installed by Lenin which then gave rise to Stalinism. Thus, Trotsky did not question the dictatorship of party over society as a whole. While many Trotskyites continued to adhere to the master's analysis of the Soviet system, others sought to extend and modify this theory. Bruno Rizzi, an Italian Marxist, falls into the latter category.

Rizzi (1939) went beyond Trotsky's characterisation of Soviet bureaucracy as a mere parasitical excrescence and described it as a new ruling class based on a mode of production which involved a form of exploitation of the sort prevailing in slave societies. The Soviet system was seen as a manifestation of 'bureaucratic collectivism': an attempt to modernise and industrialise the feudo-capitalist Russia of the Tsars under the tutelage of a bureaucratic ruling class using authoritarian and collectivist methods, bolstered by a pseudo-socialist ideological rhetoric. The Yugoslavian dissident Milovan Djilas (1957) provided a detailed account of the nature of this class and traced the source of its power to the monopolistic control it exercised over the forces of production.

Other critics, such as Tony Cliff (1974) and Charles Bettelheim (1978), described the Soviet ruling class as a state bourgeoisie, and the Soviet system as a form of 'state capitalism'. This theory was also upheld by the Chinese communists after 1968 and by their Maoist followers elsewhere in the world. They argued that in the Soviet Union, under state planning, the bureaucracy had become a personification of capital, aiming only at the increasing accumulation of capital. Hence it sought to rid itself of all forms of worker's control, atomised the working class, and instituted a coercive labour process. Thus, as in capitalism, in the Soviet Union, the workers were separated from the means of production and suffered exploitation at the hands of a bourgeoisie which dominated the state apparatus.

Critics who analysed the Soviet system in terms of bureaucratic collectivism and state capitalism argued that the USSR could move towards socialism only through a full-fledged social revolution. The Maoists, for example, called for as radical a proletarian revolution in the USSR as was needed in the capitalist countries of the west. They were right to expose the deeply exploitative and unfree character of the Soviet system, and to emphasise the need for thoroughgoing change. However, they were arguably vulnerable to some of Trotsky's strictures against the tendency to view the Soviet bureaucracy as a new class [McLellan 1983, p 175]. The bureaucracy was recruited and lacked independent roots in the socio-economic structure. Unlike capitalists, the bureaucrats neither owned the means of production nor did they pass on their wealth. The twin theories also failed to grapple with the political dynamics of the Soviet system—a defect they shared with most other Left critiques.

What Collapsed?

We have seen how theories of the Soviet system emanating from mainstream Sovietology and from the Marxist Left have turned out to be ideologically blinkered and cognitively flawed. While the former frequently tended to overemphasise politics the latter fell prey to the error of economism. A more adequate theoretical framework would, therefore, have to adopt an integrated and holistic perspective. It is my contention that the best place to look for a framework of this kind is post-Marxist theorisation which combines the Marxian emphasis on a dialectical grasp of the social totality with insights derived from various other major theoretical traditions. Paul Piccone and his confreres have been engaged in a project congenial to such theorisation, which they promote through their journal *Telos*.

Piccone (1990) sees the Soviet system as "...an intrinsically unstable dictatorship constantly in need to recreate the basis of its own legitimacy as an exceptional regime (which) generated an equally exceptional mode of industrialisation: one predicated on a state of exemption in general and military production in particular" (p 19). The society which this system created was a heavily bureaucratised one, with strong traditional residues. A major contradiction within the system lay in its bifurcated mode of production. The link between the consumer goods sector and the production goods sector was sundered as the latter was colonialised by military imperatives, while the former stagnated. Together with the gross inefficiency resulting from state ownership and central planning, as also the failure to develop new technologies, this contradiction generated an economic crisis of major proportions during Brezhnev's tenure.

The political dynamics of the system can be understood in terms of Carl Schmitt's typology of dictatorships. He pointed out that dictatorships are basically of two kinds: a commissarial and a sovereign variety. The former is based on a 'pouvoir constitue' and merely seeks to steer a system through an exceptionally difficult period. It re-establishes the constitutional order after the danger is past. The latter rests on a pouvoir constituant and is intended to bring about a qualitatively novel social order. It presumably disappears after accomplishing this task. Bolshevik Party rule began as a sovereign dictatorship over the proletariat, pledged to bring about a classless society.

In the 1930s, in the wake of failures on all fronts, Stalin sought to uphold the Leninist ideology by blaming his political opponents for the failures. He launched a reign of terror to restore the conditions conducive to the completion of the original project, thereby instituting a commissarial dictatorship. He also consolidated the power of the Party and created a bureaucratic ruling elite. It was this elite which became the new pouvoir constitue and successfully opposed Khrushchev's attempt to reinstall a sovereign dictatorship as it feared the loss of its 'nomenklatura' privileges by merely becoming a pouvoir constituant. Brezhnev's counter-revolution could neither revert to a sovereign dictatorship, nor could it champion the now discredited Stalinist commissarial dictatorship. It degenerated into a cynical and corrupt despotism which maintained the status quo by resorting to a social compromise with the state-dependent working class which was promised basic amenities and rising living standards.

Brezhnev's regime could maintain this compromise in spite of declining productivity by super-exploiting the country's natural resources and through windfall profits reaped from the export of oil during the oil crises of the 1970s. The economic exhaustion of the Soviet system had become a stark reality by the time Gorbachev came to power. The Afghanistan misadventure had not only contributed to this exhaustion, it had eroded the legitimacy of the system. The failure to maintain the social compromise caused a full-blown crisis of legitimacy, making it impossible to justify either a commissarial or a sovereign dictatorship. Gorbachev was thus compelled to recast the system—an attempt that led to the disintegration of the system as it was based on an underestimation of the society's internal involution.

Let us briefly examine the larger political implications of the Soviet disintegration. The predominant political conflict of the post-second world war era was the struggle for hegemony between capitalism and socialism—the former represented chiefly by the American bloc, and the latter by the Soviet bloc, but also to a significant extent by various regimes, parties, movements and intellectual currents elsewhere in the world. The champions of capitalism have greeted the collapse of 'actually existing socialism' in the Soviet Union and Eastern Europe as the ultimate victory of their creed [Fukuyama

1992]. Though this is a proposition of dubious validity, it reflects the current mood of triumphalism on the Right and pessimism on the Left.

As we have seen, the Soviet system was a travesty of the socialist ideal which envisions a radically democratic polity, a highly productive and rationally managed economy, and an egalitarian social order. In this perspective, the demise of the pseudo-socialist Soviet regime could be seen as a blessing in disguise. However, the matter is a good deal more complicated than that. A large number of socialists who had no illusions about the Soviet Union, nevertheless, viewed it as a strategically significant entity: "The Soviet Union needed to be there as a defective model so that, with one eye on it, we could construct a better one. It created a non-capitalist space in which to think about socialism" [Cohen 1992, p 5]. It is the loss of a viable alternative to capitalism, however inadequate it might have been, which induces pessimism.

However, the battle against capitalism, and for a better order is not lost. Indeed, it could be said to have truly begun, now that capitalism has attained global reach in the real sense. The socialist critique of capitalism, in terms of the alienation, inequality and economic irrationality it generates, has lost none of its sharpness [Worsley 1982, pp 108-10; Amin 1990]. It will be further bolstered as its contentions are vindicated at the global level. This is not to say that socialists have nothing to learn from the Soviet experience. A major lesson is the need to develop a more nuanced view of the market so that it can be put to the service of a socialist economy [Miller 1989; Bowles 1991]. The centrality of participatory forms of organisation at the level of the state and of civil society, to the socialist project, is another [Laclau and Mouffe 1985].

A rejuvenated socialism would also have to come to terms with the ecological crisis by giving up the goal of material affluence in favour of a socially just model of sustainable development. It must similarly redefine its agenda in terms of gender equality. The progressive currents within the green and feminist movements would be the natural allies of socialism, providing it with both political space and theoretical inputs [Stauffer 1990; Frank and Fuentes 1987]. The importance of developing a socialist theory of culture to meet the twin challenges of the culture industry and various forms of retrograde cultural politics such as religious fundamentalism and ethnic chauvinism can hardly be gainsaid [Williams 1981; Gordon 1993]. If the socialist diaspora urgently and energetically addresses itself to these tasks, it can still snatch a victory from the jaws of the Soviet defeat.

DISCUSSION

Agricultural Growth in West Bengal

Anamitra Saha

Madhura Swaminathan

S DATTA RAY's comments on our paper 'Agricultural Growth in West Bengal in the 1980s', *EPW*, March 26, are welcome. His comments on the quality of data published by the Bureau of Applied Economics and Statistics (BAES) are informed by his experience as director of the BAES. Datta Ray's main message is that the data on agricultural production, area and yields in West Bengal for the 1980s are unreliable and not to be used. The following, according to him, are the main sources of error in the data. First, the data on crop area are collected by the land and land revenue department and a new sampling design was introduced in 1985-86. This design required that 20 per cent of revenue 'mouzas' be enumerated each year. According to Datta Ray, about 15 per cent of mouzas are covered annually. In addition to the problem of low coverage, there is no check on the quality of the data collected.

Secondly, estimates of crop yields, based on independent crop-cutting experiments, are prepared separately by the department of agriculture and the BAES. The final estimate of yield for a crop in a specific block is an unweighted average of estimates from these two agencies. Both sets of experiments, however, use information on plots that is collected and sent by the 'amins' of the land revenue department. Datta Ray states that the information on plots required for the crop-cutting experiments is invariably behind schedule and the experiments are delayed. This delay distorts the estimates obtained from the experiments (for example, if the selected plot is harvested an alternative plot is chosen for the experiment). This problem in the estimation of crop yields affects both the department of agriculture and the BAES. We infer, then, that the yield estimates from both agencies are incorrect or biased.

Our entire analysis was based on published sources of data, and, in particular, the *Statistical Abstract, West Bengal, 1978 to 1989* published by BAES (1990) and different issues of *Economic Review* published by the government of West Bengal. On the methodology adopted, we relied on the information given in these publications (see BAES, 1990, pp 142-43). From Datta Ray's comments, it is clear that yield estimates are not obtained by experiments jointly conducted by the BAES

and the department of agriculture, and this is a useful correction to our text.

In our paper, we concluded that the growth of agricultural output in West Bengal was high in the 1980s, higher than West Bengal's own record of the previous 15 years, and one of the highest among the major states of India. We found that the rate of growth of output was high in almost all districts and for all major crops other than wheat. Our computations indicated that this high growth was not because of unduly good weather conditions and that the period of high growth was not associated with high instability in production. Lastly, we attributed the growth in output primarily to increases in yields per acre. Datta Ray implies that our conclusions are incorrect.

In order to refute our conclusions, first, it needs to be shown that the bias in the estimates of area and yield was similar in all agro-economic regions and districts of the state. Secondly, it needs to be shown that a similar bias (in terms of direction) occurred in the estimation of all crops (the example given in Datta Raya's comments applies only to 'aman' and 'aus' rice). Thirdly, it needs to be shown that the size of the bias was significant for each crop and region. Datta Ray's note does none of these.

On the size and direction of bias in the estimates of yield, Datta Ray says that: (a) for most crops, there are significant differences between estimates of yields obtained by the department of agriculture and BAES; and (b) for rice, the yield estimates are likely to be upwardly biased to an unacceptable degree. The basis for the assertion of upward bias in the estimate of rice yields is that delays in experimentation lead to an over-sampling of late-harvested plots. Datta Ray states that the late-harvested plots tend to be better irrigated, low land, high-yielding variety (HYV)—using plots in relation to the early-harvested plots (we assume this applies only to aman and aus rice as 'boro' rice is almost entirely sown with HYV seeds). Intuitively, since high-yielding variety seeds are of relatively short duration, it would appear that they are harvested relatively early. In fact, in the early 1970s, the department of agriculture did criticise the estimates of rice yields prepared by BAES on the ground that "in the case of aman, the earlier maturity of HYVs made them likely to be missed in the BAES crop cuts" [Boyce 1987, p 62]. Boyce states that "HYV aman is typically harvested from late October through November, but I know of no definitive evidence on this [early or late harvest] question" (ibid, p 83). We need field-based evidence on the timing of harvest of HYV versus traditional varieties of aman rice and the timing of the crop-cutting experiments to assess the nature of bias in yield estimates of aman rice. From the current evidence, it is quite possible that the bias is not in the direction that Datta Ray alleges, but in exactly the other direction.

Lastly, to deny West Bengal's positive comparative performance in the 1980s, it needs to be shown that the quality of data on agricultural output, area and yield in West Bengal is significantly worse than in all other states of India, and has deteriorated sharply over the 1980s. There is some evidence that for an earlier period, data on cereal production in West Bengal were relatively better than from other states [Boyce 1987]. Boyce writes, "independent estimates of cereals output by the National Sample Survey Organisation from 1957 to 1969 suggest that, compared with other Indian states, the West Bengal data are of relatively high quality" (ibid, p 60).

None of this is to deny that there may be serious problems in methods of data collection, of statistical aggregation and of the presentation of data from official sources in West Bengal and other states. Users of official data, scholars and others, need to monitor—for instance, by means of micro-studies—the quality of these data.

Postscript: At the time of writing our paper, we were unaware of the study by Badal Mukherjee and Swapna Mukhopadhyay (1994) that addresses the issue of the impact of institutional change in rural Bengal on increase in production. Using a variable trans-log cost function, Mukherjee and Mukhopadhyay estimate total factor productivity in rice production and find a significant increase in total factor productivity in the period after the introduction of panchayats. They conclude that "institutional factors have played a major role in raising production and productivity in the post-panchayat years" (p 14).

We help Nature keep her true colours.

As reputed manufacturers of vital chemical products, we've been in the forefront of promoting safety and environment protection.

Our commitment to preserve the environment, improve safety and enhance the health and welfare of our employees and the surrounding community manifests itself in every facet of our operations - right from our choice of technology to process selection and engineering design.

Effluent treatment plants at both our factories render liquid wastes harmless. Sophisticated pollution abatement equipment keep emissions within tolerance limits.

Our R&D wing develops products that are environment friendly, searches for ways to recycle waste and constantly evaluates the effectiveness of our own pollution prevention and control efforts.

We've designed education programmes to inform, train and encourage our employees to actively participate in achieving safety and environmental protection goals; safety inspections and safety audits to assure continuous control, and, onsite and offsite disaster control plans to aid effective response to a wide range of emergencies.

It's all part of our integrated effort to keep our operations safe and harmless.

And to ensure that we help Nature keep her true colours.

IN DEFENCE OF INDIA: SUPREME COURT AND TERRORISM

SO NOW YOU KNOW WHY WE ARE A PROFIT SECTOR BANK

The results of Profit Sector Banking for the year 1993-94 have come in. Posting an all time high net profit of Rs. 17.86 crore — a substantial leap from last year's Rs. 8.27 crore. And an equally impressive performance in all other parameters.
Federal Bank. Profit Sector Banking indeed.

* Deposits shot up to Rs.2433 crore from Rs.1718 crore — a growth rate of 42%.
* Advances jumped to Rs.1197 crore from Rs. 848 crore
* Reserves almost tripled to Rs.57.51 crore from Rs.19 46 crore.
* E PS. has touched a high of Rs 18.78 (annualised).
* Book value per share (Rs 10) stands at an impressive Rs 61 82
* And of course profits have reached an all time high of Rs 17.86 crore.
* Dividend increased to 25% as against 20% from last year

BALANCE SHEET (ABRIDGED) AS AT 31st MARCH 1994

Trade Restriction and Public Interest

Following the New Industrial Policy of 1991, the MRTP Act was amended and it was announced that the emphasis would hereafter shift to controlling and regulating monopolistic, restrictive and unfair trade practices. A basic change in the approach to the control of restrictive trade practices, from rule-of-reason to *per se*, has also been advocated. Does an examination of the restrictive trade practice cases actually disposed of by the MRTP Commission during the period 1972-1991 support the arguments for a policy change in the above direction? **2081**

The 'Defence of India'

The Supreme Court's judgment in the Kartar Singh vs State of Punjab case has set the judicial seal on TADA. The Defence of India, evidently, is a very demanding cause, but quite thoroughly out of tune with what is best about the Constitution of India. One should be pardoned for expecting the judges of the highest court of the land to understand that the defence of India includes the defence of the Constitution of India; that the defence of India is the defence of India as a democracy. Unfortunately, they have set these concepts one against the other and ended up looking at the defence of India the way a K P S Gill would. **2054**

By his *ex cathedra* pronouncements on the relative responsibility of the militants and the security forces for human rights violations in Kashmir, Ranganath Mishra has confirmed the apprehensions expressed when the National Human Rights Commission was set up and his own appointment as its chairman was announced. **2053**

Eroding Heritage

India is one of the world's top 12 megadiversity countries, with a rich tradition of, as well as a vigorous modern effort at, conservation of biodiversity. Yet the country's heritage of biodiversity is being rapidly eroded, thanks to a number of deficiencies in the current system of utilisation and conservation of biological resources that have resulted in a weakening of the traditions of prudent use of biomass and conservation of biodiversity, while failing to erect in their place effective alternatives. **2103**

Co-opting Feminism

Through its recently announced women policy, the Maharashtra government is attempting to incorporate certain elements of feminist ideology and neutralise its antagonistic potential. **2063**

Rural Employment

While most ministries have suffered major cuts in 1994-95 budget outlays, the allocation for the ministry of rural development has gone up by 40 per cent, with the lion's share of the increase going to the Jawahar Rojgar Yojana and its sub-schemes for rural employment creation. However, to ensure that this windfall is used effectively, the supporting delivery system needs to be shored up. **2065**

Return to Electoral Politics

The dynamics of electoral politics revealed in the by-elections from the assembly constituencies of Nakodar and Ajnala have far-reaching implications for Punjab. **2095**

Financing Education

The report of the Justice Punnayya Committee appointed by the UGC makes a strong case for rethinking the attitude to financing higher education which has emerged in the wake of economic liberalisation. **2060**

Cultural Imperialism

One of the great deceptions of our times is the notion of 'internationalisation' of ideas, markets and movements under whose guise the US and Europe have become dominant exporters of cultural forms most conducive to depoliticising and trivialising everyday existence. **2070**

Post-Cold War Realities

The Kantian vision of the brave new post-cold war world, globalised and deideologised, has had to contend with international realities that refuse to fit into any teleological scheme. **2067**

Extending Reservations

RECENT events in Karnataka have rendered my note (July 9) outdated and my attitude too sanguine. The state government has diluted its earlier G O by bringing the entire veerasaiva (lingayat) and vokkaliga communities within the ambit of reservations. It will be recalled that the first G O had treated only the rural sections of these two communities as backward. This is not all. Lingayats and vokkaligas were placed in separate categories so that there can be no risk of competition between them. The new G O effectively puts the state's reservation 'policy' (*sic*) back to the situation which has prevailed from 1986 onwards.

That this dilution is done with an eye to the coming elections needs no elaboration. The immediate provocation appears to have been the mass rally of the Vokkaligara Sangha and its threat of an agitation against the community's exclusion from reservation. Despite the announcement of the new G O on July 24, the Vokkaligara Sangha went ahead with its largely attended rally. The chief minister continues to claim that all this is in the interest of justice. The truth is that the latest volte face has made a total mockery of reservation and the appointment of the permanent Backward Classes Commission redundant.

V K NATRAJ

Mysore

Ghettoising Gender

WITH reference to Neera Desai's comments (July 9) on my article (May 7) I would like to make the following two clarifications: (1) The comments are well taken. Dhanagare's 'Report on Sociology in the Western Region', which I quote, does have a separate section on sociology in SNDT University. I did not refer to it in my brief comment, only because the focus was on 'mainstream' (to be read 'malestream') sociology syllabi. A department that introduced a paper on 'Women and Society' in the mid-60s and opened its doors to non-elite women and sought to vocationalise its courses and make them socially relevant cannot possibly be a malestream department. I do sincerely regret that the pioneering efforts of the SNDT University were not mentioned. The intention was not to marginalise the role of SNDT or the RCWS which has been a source of inspiration for my generation of feminists but to focus on 'what was not being done' in mainstream/malestream departments.

(2) In a more detailed analysis of sociology syllabi, in my doctoral work, the documents and reports of Curricula Development Workshops that Desai mentions in her letter have been referred to. The efforts of the SNDT sociology department, in offering courses on 'Women and Society' at a time when there was no acceptability from the mainstream have been path-breaking. At the present stage what bothers many of us is the very 'acceptability' from the 'mainstream' which ghettoises 'gender' into single courses on 'Women and Society', leaving core courses on Indian society and social theory undisturbed. This is true of both 'malestream' and 'non-malestream' departments of sociology. In fact we look forward to 'non-malestream' departments such as the one in SNDT to take the pioneering step in taking 'gender' out of its seclusion in 'Women and Society' courses and granting it its rightful place as a perspective in all the core courses.

Assessing Gorbachev

THE contribution of Bhupinder Brar (June 11) is an excellent as well as enlightening exposition of the aspirations and ideals, achievements and failures of Gorbachev. His admirable attempt to be objective in the evaluation of the Russian leader's thoughts and activities is highly commendable. At the same time, Brar could have pointed out that Gorbachev was a child of the contemporary era, noted for the stimulating and salutary sway of the spirit of the scientific and altruistic humanism with which he earnestly endeavoured to identify himself. One other than a Russian felt that a person known for courage and conviction was uncharitably isolated by his fellowmen.

Madurai

Teaching Aids Needed

A friend of mine, Fajruddin Khan, has just started a school of girls—the Bibi Fatima Kanya Vidyalaya—in Haryana's backward Mewat region. This area is inhabited largely by the Meo community, an extremely impoverished people. The female literacy rate among the Meos is, according to a printed appeal brought by Fajruddin, a mere 0.018 per cent. Hence, his school is really a pioneering effort. The school's fledgling library is badly in need of books and teaching aids for the students. Readers who wish to help a noble cause could send such suitable reading material to the following address: Fajruddin Khan, Sarpanch, Village: Duha, Tehsil: Ferozepur-Jhirka, District: Gurgaon, Haryana.

ECONOMIC AND POLITICAL

So What Else Is New?

ADDRESSING the consultative committee of parliament attached to his ministry last month, finance minister Manmohan Singh once again drew attention to the country's "very strong" balance of payments position, with foreign exchange reserves now exceeding $ 17 billion, and reiterated that the rise in reserves had not been the result of inflows of volatile foreign capital or an increase in external debt. Interestingly, precisely because of the apparent improvement in the balance of payments and the impressive level of the government's foreign exchange assets, the country's commercial borrowings have also begun to go up once again and, what is most relevant, much of such borrowing is evidently for relatively short periods of two and three years. Certainly, the situation today is vastly different from what it was in 1990-91, but it still bears remembering that the servicing commitments on very short-term commercial loans, allowed to be raised with thoughtless abandon in the last years of Rajiv Gandhi's government, had been a decisive factor in the payments crisis which then drove the country to the portals of the IMF.

From a level of $ 2.2 billion in 1990-91, net commercial borrowing had dropped to a negative figure of $ 451 million in 1992-93. But with the Indian economy securely under Fund-Bank tutelage and the government's growing foreign exchange kitty, the multinational banks are once more licking their chops and getting into position to grab their share of some easy pickings. And so India's net commercial borrowings, which are estimated to have picked up to the level of $ 625 million in 1993-94, are officially expected to more than double this year. In 1993-94 the limit of $ 2.5 billion which the government had set for approval of commercial loan proposals for the year was fully used up and it has to be seen whether combined pressure from international lenders and intending Indian borrowers will persuade the government to relax the ceiling, set at the same figure, for the current year.

The readiness of international bankers to extend commercial loans to Indian borrowers has been, altogether expectedly, interpreted in official and sympathetic quarters in this country as yet another emphatic vote of confidence from abroad in the government's economic liberalisation policies and the wonders they have supposedly done for the country's economy. In this context surprise is being expressed that Moody's and Standard and Poor's, the two leading international rating agencies, should continue to baulk at elevating India's credit rating by at least a notch or two. But, no matter, we seem to be doing just as well without the benediction of these agencies—just look at the queue of international bankers eager to stuff money into our pockets, seems to be the official attitude.

Things are not quite that simple, unfortunately. A slightly closer look at the supposed rush of loan offers from foreign lenders brings out that what are on offer are mostly short-term loans for two and three years. Lenders are apparently not prepared to risk even five-year loans and when they are, the spread over the LIBOR that is demanded is near-extortionate. So much then for the vote of confidence. The fact is that the international banks have, on the basis of India's current level of foreign exchange reserves and the likely trends in different items of the balance of payments, come to the conclusion that it should be more or less safe to extend loans repayable over two-three years to Indian borrowers. Such calculation together with the fact of slack demand for their funds from borrowers in the developed countries, still at various stages of emerging from their respective recessions, explains their seemingly eager search for Indian borrowers.

What calls for closer scrutiny is really the rush abroad of Indian companies anxious to raise short-term funds on the terms on which they are being offered. The sizeable difference between domestic interest rates and those on which commercial loans abroad can be had is, of course, an obvious consideration. On the other hand, the short period for which alone these loans are available make it clear that in seeking them the Indian borrowers do not have in mind financing of industrial investment essentially. Clearly, the money is being raised with other uses in mind. Even with long-term moneys, raised through GDR issues for instance, the government has dismally failed to exercise any control over the funds' end use. In large part these funds have been used, apart from for retiring higher cost domestic debt, for a variety of speculative investments, in the stock market and in real estate for instance, which have been crowding out, to use an expression so favoured by the liberalisers, productive investment in the economy. This is not unknown to the finance ministry which, despite liberalisation, has retained with itself the authority to approve proposals for raising commercial loans abroad. Are these powers being used for any higher purpose than dispensing patronage as was the case in the bad old licence-permit-raj days?

PERSONAL LAWS

Pandering to Orthodoxy

IF we are to accept the recent statement of the union minister of state for law, H R Bharadwaj, in the Rajya Sabha on August 3 as the official stand of the government, we understand that the centre is not considering the enactment of a uniform civil code for all citizens, since such an enactment would involve changes in the personal laws of the minority communities. The government does not want to interfere in the personal laws of these communities unless the initiative for change comes from the communities themselves, according to the minister.

Fine sentiments. But how does the centre respond to initiatives for changes from within the minority communities? We have already seen how the ruling party at the centre under Rajiv Gandhi thwarted the efforts of the Muslim reformist elements, and reinforced the position of the orthodox 'mullahs' of the community in the Shah Bano case. We now come across another instance of the centre's reluctance to interfere in the personal laws of another minority community, in spite of a well organised campaign from within the community to change its personal laws.

Christian women activists in different parts of India had been waging all these years a struggle to reform their religious laws regarding marriage, divorce, inheritance of property, etc. To their persistent demands for state intervention in changing these outmoded laws, the government at the centre had always advised them to first seek a consensus of the various Indian Christian establishments on the changes that these activists and reformers were proposing.

It took 10 years to get all the leaders of the numerous Christian sects—their growth as prolific as that of their counterparts among Hindus and Muslims in India—to agree to changes in the proposed Christian Marriage Bill, drafted by the Joint Women's Programme, a voluntary organisation. Since the Christian religion does not advocate divorce and professes the sanctity and indissolubility of all marriages, in order to get around it, the draft defines 'divorce' as the 'termination of civil effects of marriage'—a clever device to make the clergy accept an uncomfortable ground reality! But now, after all these years of hair-splitting arguments over Biblical interpretations and patient and gentle persuasive attempts to bring around the clergy of the different Christian sects, when a draft bill (based on a consensus) has been submitted to the centre, the latter is sitting tight on it. Meanwhile, in Kerala, the Congress-run state government is introducing legislation aimed at curbing the Kerala Christian women's right of inheritance to parental property.

It is quite evident that the ruling powers at the centre, irrespective of their political hue, can never dare to bring about state intervention to abolish obnoxious provisions of personal laws—whether of the majority Hindus or the minority communities—as long as they decide to placate the orthodox religious leaders of these communities with the hope of capturing their respective vote-banks. Religious and social reformers among the Hindu and minority communities today can, therefore, hardly expect the 'secular' Indian state to be their ally in their struggle to bring about changes in the discriminatory and oppressive laws and practices still being imposed on the disadvantaged sections of their communities.

PANCHAYAT RAJ

Task for Finance Commission

THE 73rd amendment to the Constitution went out of the way to provide that the national level Finance Commission would consider "the measures needed to supplement the Consolidated Fund of a state to supplement the resources of the panchayats in the state on the basis of the recommendations made by the finance commission of the state". The 74th amendment has a similar provision relating to the municipal bodies.

The whole purpose of this provision could have been to assure the state governments that if, as a result of the decentralisation of various functions and responsibilities to local bodies and the need to transfer adequate funds for the purpose, they fell short of funds for their own purposes at the state level, the Finance Commission at the national level would consider their requirements and make recommendations with regard to "the measures needed to supplement" the states' resources. This presumably was the centre's way of providing an incentive to the states to decentralise.

However, K C Pant, chairman of the Tenth Finance Commission, has reportedly disavowed any intention of going into the question of supplementing the states' finances to enable them to meet their requirements in pursuance of the implementation of the two constitutional amendments on decentralisation. Could this stance of Pant be because the state finance commissions will take long to come up with their reviews and recommendations, whereas the Tenth Finance Commission's own term is due to expire soon? If this were the explanation, the right thing to do would be to extend the term of the commission, of course, for this particular purpose only and, at the same time, set a deadline for the state finance commissions to report. The main report of the Finance Commission need not be held up, even though its subsequent consideration of this additional item would necessarily mean some modification of the main award on centre-state transfers. Otherwise, if consideration of the states' requirements for additional funds to finance decentralisation is postponed to the next national level Finance Commission, this in itself could act as a strong deterrent to decentralisation of functions by the state governments. No state government can be expected to take on additional financial burdens in order to fulfil the commitments which the centre is keen to make but *not* underwrite.

KARNATAKA

Unjustified Dilution

THE Karnataka government's backtracking on the issue of implementing the Chinappa Reddy recommendations on reservations is yet another illustration that little can be achieved in terms of affirmative action unless the politically powerful among those who benefit by such action approve of the measures. The government's recent decision to increase the reserved quota from 73 per cent to 80 per cent, overruling the opinion of the law secretary and circumventing the permanent Backward Classes Commission which it had set up only a few months before is clearly a consequence of the political and financial power wielded by the dominant vokkaliga and lingayat communities. The increased 7 per cent benefits these two communities, the marathas and the bunts. The new order does away with the rural criteria for vokkaligas to access these benefits. Professionals like doctors, lawyers, engineers, etc, who were in the earlier order excluded can now avail of reservation benefits. The new order thus dilutes the concept of the creamy layer though income tax assessees other than these professionals still do not benefit.

Ever since the earlier order on the reservations the vokkaligas have been mounting protests which have made their presence felt in the cabinet, the ruling party and in public. This protest culminated in a rally called by the Vokkaligara Sangha. In an attempt to diffuse the impact of the rally the government announced the new order. Interestingly, the Sangha went ahead with the rally with a massive show of its political influence in terms of the huge vote bank. The panoply of big names who graced the rally included film stars, commercial and landed interests and intellectuals. With the assembly elections slated for November, it is not surprising that the Veerappa Moily government has decided to mollify the powerful backward community.

Significantly, while the opposition has expectedly criticised the new order in the general terms of it having diluted the reservation provisions for the backward

classes, nothing like a consistent opposition to the order has emerged or is likely to. The only sharp and uncompromising reaction appears to have come from a cabinet member, the forest minister H Vishwanath who is from a backward community and protested the cabinet decision (taken at a meeting he could not attend) to promulgate the new order. While Vishwanath's stand, which is generally taken to be the opinion of the backward community, will cause some ripples, it will hardly change Moily's stand especially given that another cabinet colleague S M Krishna, a long time chief minister-in-waiting is an influential leader of the vokkaliga community.

All this comes against the background of Congress defeats in the recent mayoral elections in Gulbarga and Hubli-Dharwar, which showed that the dissent within the party continues to be active, making for cross-voting which eventually led to the victory of the opposition candidates. With the nuisance value of S Bangarappa's Karnataka Congress Party and the upbeat mood in the state Janata Dal, it is not surprising that Moily should see the need to create the opportunity to consolidate his vote banks later in the year.

CHINA AND INDIA

Old Attitudes

WHATEVER comforting and convenient interpretation our foreign office bureaucrats might give to the utterances of the Chinese vice-premier and foreign minister Qian Qichen during his recent visit to New Delhi, it is clear that they had not managed to squeeze out any concessions from Beijing.

While harping on the worn-out diplomatic rhetoric about the need for bilateral talks on Kashmir, Qichen reiterated at the same time his government's policy to continue arms sale to Pakistan—the same arms which Pakistan uses to equip its mercenaries in Kashmir. It is true that Chinese arms aid to Pakistan constitutes a tiny portion of the total Pak arsenal, which is mainly filled by the US and the west. But before advising India and Pakistan to "ease the situation" on Kashmir, Qichen should have remembered that his government is also no less responsible—maybe on a minor scale compared to the western military sources—for aggravating the situation in the Indo-Pak subcontinent by its arms aid. Significantly, Qichen never bothered to pay even lip-service to the announced wishes of the Kashmiri people when recommending bilateral talks, as if it was a matter to be settled over their heads by New Delhi and Islamabad. Yet it was his government which in 1965 signed a communique with Pakistan (the Chou-Ayub communique, which said that "the Kashmir dispute could be resolved in accordance with the wishes of the people of Kashmir..."). Whether it was one of the usual homilies of Beijing—devoid of any ideological commitment—or not, it is obvious that even at the level of diplomatic rhetoric today Beijing has travelled a long way from the 1960s.

As for Sikkim (which featured in the recent New Delhi talks), the way Indira Gandhi annexed it in 1974 drew the ire of Beijing as well as other democratic-minded people elsewhere (including a few inside India). But, during the last 20 years, there has been no manifestation of any Sikkimese popular protest against Indian overlordship (unlike in Tibet, where China continues to face sporadic explosions of discontent and quite often even organised dissent). Given this ground reality, one wonders what China gains by sticking to its old position of refusing to recognise Sikkim's annexation. If it is a matter of principle, China had shown little respect for such principle in its own dealings with Tibet. If it is a matter of scoring a point over India by counterposing (New Delhi's annexation of) Sikkim to (Beijing's forcible seizure of) Tibet, China is clearly in a rather disadvantageous position. New Delhi can claim to have brought the Sikkimese into the Indian national mainstream of political skulduggery. Unlike the Tibetan political opponents of Beijing (who are fighting for independence), the Sikkimese politicians during the last two decades have been trained by the Indian political system in the skills necessary to survive as wheeler-dealers—as evident from the present goings-on in Gangtok, what with the Bhandari-Limbu conflict—within the Indian Union. China could have learnt a few tricks from India as to how to co-opt its Tibetan dissidents. But it may be too late now.

To demystify the Chinese position, whether on Kashmir or on Sikkim, it is necessary to remember that Beijing's policies on these issues were shaped by the politics of an era which is no longer relevant. Both on the Kasmir issue in the mid-1960s, and the Sikkim issue in the mid-1970s, Beijing's politics was shaped not by any democratic concern for the people of Kashmir and Sikkim, but mainly by its anti-Soviet policies of those days—which it extended to India, since New Delhi at that time was an ally of Moscow's. The convergence of Soviet and Indian interests demonstrated during the 1962 Sino-Indian border war and later during the 1971 Indo-Pak war over what is today Bangladesh, pushed China—purely from national and territorial interests—towards a closer alliance with Pakistan.

But today, with the collapse of the Soviet Union, much of the rationale of Beijing's old policies in the Indian sub-continent may appear anachronistic. Since it has already shed its past commitments to building a communist society in China—notwithstanding the hackneyed Maoist slogans—and opened up its economy to the capitalist west, it might as well revise its India policy and give up the old trick of playing off Islamabad against New Delhi. The latter in any case cannot dislodge Beijing from Aksai Chin, and in spite of all the patriotic bombast, the Indian government has virtually accepted the Line of Actual Control as a *fait accompli*. Why then should China continue to regard India as a threat? Is India that powerful as to warrant China's arming Pakistan and propping it up as a military buffer state?

BANGLADESH

Rule of Law?

THE ongoing tussle between Taslima Nasreen and the Khaleda Zia government is both a symptom and a consequence of the three-year-old government's inability to come to grips with the administration of the country. The ruling Bangladesh National Party (BNP) has also, it would seem, been unable to set itself a political or economic agenda. As a result, virtually every issue which has come up before the government is being decided either in the streets or in the courts of law.

Take the case of Golam Azam. The recent appellate court judgment restores Bangladeshi citizenship to Azam overturning the Zia government's decision to declare him a foreigner and thus make it impossible for him to function as the leader of the Jammat i Islami. The decision also goes against the large and vocal demand by a large section to declare him a war criminal for his collaboration with the Pakistani forces during the liberation war. In fact the anti-communalist rally last month, defending Taslima and aiming to counter the call of the fundamentalists, had as one of its demands the Azam issue.

In the case of Taslima the government filed a case under an archaic penal code accusing her of hurting religious sentiments by calling for a review of the Koran. (The author has subsequently explained that she had, in fact, asked for a review of the Shariat, not the Koran.) But when fundamentalists called for her blood and the situation was getting out of hand, the Bangladeshi government, under pressure from the US and other western countries, has so far at least categorically refused to enact a blasphemy law as has been done in some other Muslim countries, and has sought to explain away its action against Taslima.

The BNP, after it lost the support of the Jamaat when it declared Azam a foreigner, has been trying to make up with fundamentalist groups. There are also forces within the party which are forcing it in the other direction. All this has meant that it has been able to pay little attention to the tasks of governance. Currently it is facing an

opposition demand that a caretaker government be installed before the elections to ensure free and fair elections. The entire opposition including the government's erstwhile supporter, the Jamaat, has boycotted the current session of the parliament. Interestingly, in a recent by-elections in northern Bangladesh, with all the main opposition parties, that is the Awami League, the Jatiya Party and the Jamaat, having refused to participate in protest against the government's refusal to pass an amendment providing for a caretaker government, the BNP won without opposition adding to its numbers in parliament. The government has, however, offered to pass an amendment strengthening the Election Commission's role in the conduct of the elections.

The opposition's demand is based on the assumption that the BNP government or any government in power would not be neutral. While such has been the case in the past, the demand, if it is conceded, would go against the grain of established democratic practice. And one may well ask if the better way of ensuring fair elections is not to empower the people, which would mean working at the grass roots. However, it is also true that Bangladesh's legal structure has seen little change after the end of colonial rule and sticking to the law in a land where for such a long time, under Ershad, the legal system had served the government's interest is not seen as democratic practice by the people.

SOUTH AFRICA

A Different Budget

Kamaroopi writes:

CERTAIN features of the functioning of the parliament in South Africa appear to differ so fundamentally from what one is accustomed to in India (even if from a great distance and second hand by reading newspapers) that they deserve to be noted.

The South African system of government underwent several transitions after the country was expelled from the Commonwealth. (Till then parliamentary practice, always remembering how little the institution was representative, broadly corresponded to the Westminster model.) When South Africa became a republic and later adopted the model of an executive presidency, the importance, indeed the very relevance, of parliament was greatly reduced. The recent elections and the obviously more representative character of the new parliament do not appear to have made any difference. Parliament continues to be quite marginal to the actual conduct of government and politics in South Africa.

On the face of it, the fact that the seat of parliament, Cape Town, is over a thousand miles away from the administrative capital, Pretoria, may suggest that the law-makers of the country were so sensitive to administrative and bureaucratic interference in matters essentially political that they physically removed themselves as far as they could from the seat of government, indeed almost to the southern tip of the country and the continent. But in reality the distance underlines the marginality of Cape Town; even the city structures outside parliament are indifferent, if not hostile, to the honour of having the law-makers descend upon their city periodically

Perhaps the most striking demonstration of the marginality of parliament in South Africa is the substance and manner of the presentation of the annual budget. On June 22, the budget for 1994-95 was presented to parliament in Cape Town by the finance minister, Derek Keys (who has since resigned, ostensibly on 'personal grounds'). That morning the resident local and foreign correspondents were asked to assemble at the parliament buildings around 9 a m. (Incidentally, unlike in India, access to the premises was a routine affair; one did not have to procure passes or similar clearances.) Half an hour later, the assembled reporters were all given the finance minister's budget speech, the 'Budget Review', a substantial document which summarised the budget and also had elements corresponding to the pre-budget *Economic Survey* in India, as well as the detailed budget papers. We were allowed an hour or so to study the papers. Around half past ten the finance minister along with his deputy and three other senior officials of the finance ministry addressed the press, explaining the salient features of the budget proposals and also answered questions.

The amazing thing (for an Indian reporter) about the whole exercise was that the actual reading of the budget speech in parliament was to begin only at 2.15 p m. Quite simply, the reporters had all the papers hours before the honourable members of parliament had a chance to know what these contained. Of course, the reporters were confined—though egress from the premises was not difficult—till 2.15 p m to that floor of the parliament annexe where they had been given the budget papers and later briefed; and they were also enjoined not to communicate with anyone from outside. However, they were allowed to begin to write their reports; only, they could not file their reports till the embargo was lifted. Nobody seemed to consider the possibility of access to the outside world by telephones, including the ubiquitous cellular telephones which everyone seems to carry. Of course, one should also bear in mind that the provisions of the budget were such that the apparent openness was perhaps justified. For not merely the form of the exercise, but even the content of the proposals appeared to be quite peripheral to the actual functioning of the government, not to speak of specific economic policies.

TWENTY YEARS AGO

EPW, August 3, 1974

A supposedly basic tenet of the legal system that we pride ourselves on in this country is that an accused cannot be made to give evidence against himself. Following from this,, confessions made by accused persons are not admissible as evidence in courts of law. That is the law; the practice is, of course, very different. It is well known that virtually every single police investigation proceeds on the basis of information extracted from suspects in the course of so-called 'interrogation'. That the 'interrogation' really consists of the use of physical torture in varying degrees is equally well known. The police are helped in this by the practice of the courts of remanding suspects to police custody for long periods as a matter of routine and refusing bail even where the alleged offences are relatively trivial and bailable. Of course, in a large number of cases, the suspects are too poor and too ignorant to engage lawyers and to assert their legal rights. This very greatly simplifies matters for the police.

The beating up of suspects in police stations is thus a routine matter and normally attracts no attention, much less any protest. Once in a while, things do get a bit out of hand. The torture is particularly severe or the suspect is rather less hardy and he dies of injuries sustained during the police 'interrogation'. By the letter and spirit of the law this is murder. Yet police functionaries know that they can belabour suspects without any fear of the consequences; they have to fear only if they do not manage to extract enough information.

Sometimes when a person dies as a result of police torture, the event merits a cautious, often garbled, report in the newspapers. That way the last one week has been rather unusual; during this period Bombay papers have reported the cases of four persons, all of whom died in circumstances which give rise to reasonable suspicion that their deaths might have been the result of the treatment meted out to them while in police custody. Of the four, three died while in police custody and one within two days of being released from such custody.

Micro Energy

MICRO ENERGY (INDIA) plans to manufacture switch mode power supplies (SMPS) and high density SMPS (HDSMPS) in technical-cum-financial collaboration with Micro Energy Inc and Power Sensors Inc of the US. Micro Energy and Power Sensors have both agreed to buy back $ 5 million and $ 0.3 million worth of products respectively in the first few years. Originally set up by A Umamaheswaran and S Venkataramani in 1986 for manufacturing power supplies, the company was taken over by M Jayaram and associates for a consideration of Rs 16 lakh as it could not implement the project due to ill health of the original promoters. SMPS are used as a source of DC power in almost all electronic products due to their efficiency and lower heat dissipation. In addition to catering to the telecommunication sector, the company also plans to supply its products to the computer industry as Power Sensors has established its name internationally in notebook computers field and has clientele like Hewlett Packard and Tektroniks. To part finance its project the company is entering the capital market on August 9 with a public issue of equity shares at par. The issue will be lead managed by Bank of Baroda and Times Guaranty.

Pudumjee Agro

Formerly a subsidiary of Pudumjee Pulp and Paper Mills, Pudumjee Agro Industries (PAI) was taken over by S M Jatia in February 1987. Initially engaged in the manufacture of various grades of paper, including some categories of speciality paper, PAI acquired a sick solvent extraction unit with an installed capacity of 40,000 mtpa in 1990 and currently both divisions contribute equally to its turnover. The company now plans to add 5,000 tpa to its existing capacity of 20,000 tpa for manufacturing paper in addition to setting up a 50 tpd refinery, at a total cost of Rs 9 crore. The expansion-cum-diversification project is expected to be completed sometime in August next year. To finance its project the company is entering the capital market with a public issue of equity shares of Rs 10 each which will be offered at a premium of Rs 90 per share. The issue will open for subscription on August 9 and will be lead managed by Kotak Mahindra Finance.

Rajoo Engineers

Rajoo Engineers, which is engaged in the manufacture of plastic processing machinery such as pre- and post-extrusion plants and thermoplastic extrusion plants, is now increasing its capacity and adding manufacturing facilities for mono- and multi-layer film plants. Though commercial production has been delayed by six months and is now expected to commence in this October, the project has not suffered any cost overrun. The company's products will cater to the plastic industry which is expected to grow at a decent rate in the future. For the year ended March 1994 the company earned a net profit of Rs 27 lakh on a sale of Rs 1.9 crore. To part finance its project the company is entering the capital market on August 9 with a public issue of equity shares at par.

Trans Techno

Trans Techno Foods is setting up an oyster mushrooms project in technical collaboration with the US-based World Discoveries Inc. The foreign collaborator will also buy back 100 per cent of the company's output for a period of five years. Though Trans Techno Foods is the sixth mushroom manufacturer to go public in the last two years, unlike the others who have opted for button mushrooms, the company is going in for oyster mushrooms which command better price realisation because of their high quality in addition to having a faster market growth rate than the former. To part finance the project the company is entering the capital market with a public issue of equity shares at par. The issue which will open for subscription on August 9 will be lead managed by KMF.

B Nanji Enterprises

B Nanji Enterprises, which is engaged in construction and land development is now setting up an aluminium rolling mill and an extrusion plant to manufacture aluminium collapsible tubes, slugs and circles with a capacity of 6,000 tpa. Aluminium collapsible tubes find application in the pharmaceutical and cosmetic industries while slugs are used for making cans, bottles, and in 'ceasefire' equipment. Aluminium circles are used in the manufacture of pressure cookers and other utensils. To part finance its project the company is entering the capital market with a public issue of equity shares at par on August 9.

Dhara Packaging

Dhara Packaging is entering the capital market with a public issue of equity shares at par on August 10 to part finance its modernisation-cum-diversification project. The company which presently manufactures release papers and self-adhesive label stock is diversifying into the manufacture of BOPP tapes and speciality papers and also modernising its existing facilities at a total cost of Rs 3.4 crore. Production which was initially expected to commence in July this year has now been rescheduled to October due to delay in project implementation. For the year ended March 1994 the company earned a net profit of Rs 13 lakh on a total income of Rs 2.4 crore.

Global Foods

Global Foods (GF), which has been promoted by R S Kholi, is setting up a 100 per cent export-oriented unit to process 6,000 tpa of frozen meat (beef and mutton). To part finance the project the company is entering the capital market on August 9 with a public issue of equity shares at par. The promoter, who will have a 31.7 per cent stake in the post-issue equity capital of the company, has been in this business for the last 12 years and has been exporting meat and mutton through a partnership concern called Premraj Cold Storage (PCS) which processed 500 tpa of meat in two leased plants. PCS will now provide GF with technical know-how and has given the company marketing rights for its brand 'Top' in addition to giving assurance to export GF's entire production for a royalty of Rs 2.5 lakh per annum.

Indo Amines

The Techno group which has been engaged in the oleochemicals for more than a decade is entering the capital market through Indo Amines, a company incorporated in 1992. The group's present capacity utilisation is above 100 per cent and in order to cater to the growing demand Indo Amines is setting up a project with a capacity to manufacture 1,200 mtpa of fatty amines, 200 mtpa of short chain fatty amines, 1,000 mtpa of quaternary ammonium compound and 2,000 mtpa of EO condensates. Commercial production is expected to commence in July 1994. To part finance the project the company is entering the capital market with a public issue of 46,50,000 equity shares of Rs 10 each at par. The issue which opened for subscription on July 27 was lead managed by Market Creators.

CURRENT STATISTICS

EPW **Research Foundation**

Monetary data for the first quarter of the financial year show a sharp reining in of the government's monetised deficit. Nevertheless, the growth of reserve money has been phenomenal (Rs 8,966 crore against Rs 2,562 crore in the first quarter of last year), reflecting the burgeoning foreign exchange reserves. Further, the rise in net bank credit to the centre, at 6.5 per cent, shows that the compression of net RBI credit to the government has been possible only because, in the absence of growth of bank credit to the commercial sector, the commercial banks have had the funds to pour down the fiscal hole.

AMAR DYE-CHEM

Towards Recovery

A 40-YEAR OLD company, Amar Dye-Chem, which seemed to be coming back into the black since 1989-90 after reporting losses for six years in succession, plunged into the red once again in 1992-93, adding a hefty Rs 21 crore to its accumulated losses. The company has two factories at Kalyan in Maharashtra and Vapi in Gujarat where it manufactures synthetic organic dyestuffs/pigments and dyes intermediates. While the company's sales were lower by 5.5 per cent over the previous year, operating profit fell by 177 per cent. Poor offtake due to bad conditions in the user industry, competition from the un-organised sector, which is a major drawback for the industry and the rising interest burden seems to have affected the company's operations. While production of synthetic organic dyestuffs and pigments during the year was higher at 645.4 mt as compared to 616.6 mt in 1991-92, that of intermediates and chemicals fell drastically from 4,590.2 mt to 3,851.3 mt. Sale of synthetic organic dyestuffs and pigments was also lower at 544.5 mt as compared to 559.1 in the previous year while that of intermediates and chemicals was also lower at 1,524.8 mt as against 1,868.8 mt in 1991-92.

Meanwhile with the Mardia group taking over the management of the company, Amar Dye-Chem has shown improved performance for the year 1993-94. The BIFR scheme envisaged a capital expenditure of Rs 750 lakh and a one-time payment of Rs 15.3 crore against the dues of institution/banks. Further the Mardia group has been allotted equity shares of the face value of Rs 15.5 crore (as partly paid-up). The company's interest burden is expected to come down with the reduction in outstanding loans. For the year ended March 1994 the company posted a net profit of Rs 1.1 crore on a net sales of Rs 60.3 crore. More importantly, a major part of this profit, i e, up to Rs 1.0 crore, was earned in the second half of the year.

BIHAR CAUSTIC

Improved Performance

Bihar Caustic, a joint venture promoted by Bihar State Industrial Development Corporation, Gwalior Rayon Silk Manufacturing and Weaving Company, Hindustan Aluminium Corporation and Pilani Investment and Industries Corporation, has achieved a dramatic turnaround in 1992-93. After an erratic performance in the last decade the company saw a 19 per cent rise in net sales and a 57 per cent rise in operating profit. An 8.0 per cent fall in interest charges coupled with a 25.7 per cent fall in depreciation provision over the previous year further led to a sharp rise in profitability. Though production of the company's main product, caustic soda, was marginally lower during the year at 37,226 mt (37,692 mt) due to the power crisis in Bihar in May 1992, that of liquid chlorine and hydrochloric acid (100 per cent) was higher at 12,873 mt (10,319 mt) and 46,611 mt (35,523 mt), respectively. Better sale realisation on caustic soda despite a fall in sale volume from 37,375 mt last year to 35,954 mt coupled with higher offtake of chlorine hydrochloric acid and diluted sulphuric acid led to a better financial performance by the company.

With the refusal of the Bihar State Electricity Board to deliver a second-hand 15 mw captive power plant to the company as per the rehabilitation scheme, the company was unable to implement the rehabilitation project. With power and fuel expenses accounting to up to 41 per cent of net sales, the implementation of a captive power plant could prove to be a boon for the company's profitability in the future.

Meanwhile for the year 1993-94 the company has further consolidated its performance by posting a net profit of Rs 6.4 crore on a net sales of Rs 46.7 crore. The company achieved an operating profit margin of 27.1 per cent and a gross profit margin of 22.1 per cent for the year. Encouraged by its performance it has declared a dividend of 15 per cent for 1993-94.

TATA-YODOGAWA

Growing Sales

Jointly promoted by the Tata Iron and Steel Company (Tisco), Yodogawa Steel Works and Nissha Company of Japan in 1968, Tata-Yodogawa is engaged in the manufacture of steel mill rolls of all grades and types, cast gear wheels, rope drums, cast steel grinding media, etc. Despite the adverse conditions in the steel industry, the company managed to improve its net sales by 3.9 per cent in 1992-93 and its operating profit by 70.1 per cent. The company achieved a record capacity utilisation of 102.8 per cent by producing 8,018 mt of rolls as against 7,611 mt produced last year. Despite lower offtake of rolls in volume terms (down to 7,253 mt as against 7,631 mt in the previous year) higher price realisation led to improved margins. Production of concast billets fell from 14,054 mt last year to 9,467 mt and sale falling from 8,476 mt to 3,326 mt. The company exported only 391 mt of rolls valued at Rs 0.9 lakh as against 941 mt valued at Rs 2.0 crore exported last year.

The company's centrifugal casting machine was set up in the latter part of the year with technical collaboration from Eisenwerk Salzau-Werfen of Austria and centrifugally cast rolls produced with the new technology were delivered to the Tisco, Bokaro and Rourkela steel plants. With the conversion of 29,73,450 partly convertible debentures (PCDs) of Rs 30 each into equity shares of Rs 10 each at a premium of Rs 20 per share in July 1993, the company's equity capital stands increased to Rs 5.5 crore.

For the year ended March 1994 the company's net sales rose to Rs 67.8 crore though net profit was maintained at Rs 2.5 crore. Production of rolls was lower at 7,519 mt as against 8,018 mt produced in the previous year and the company produced hi-chrome rolls for the first time. Further the company exported rolls worth Rs 91.7 lakh in 1993-94.

TVS ELECTRONICS

New Products

TVS Electronics (TVSE), a company promoted by Sundaram Clayton, is engaged in the manufacture of switch mode power supplies, uninterruptible power supplies, computer peripherals, computer equipment, electronic power conditioners and micro-processor-based controller cards. The devaluation of the rupee (71.3 per cent of the company's raw material is imported) coupled with the market-driven restrictions resulted in lower margins on almost all the products of the company. Consequently while the company's net sales increased by 17.6 per cent in 1992-93, its operating profit rose by a mere 3.5 per cent and net profit fell by 4.8 per cent over the previous year. The company claims that it has been able to maintain its premier position in the market despite competition from imported products following the opening up of the Indian economy. Expanding its product range, the company introduced laser printers and a model of heavy duty printer which were reportedly well received in the market.

Though the company has not commenced direct exports (present exports are mainly through computer original equipment manufacturers), many prospective buyers have evinced keen interest in its products. The company has plans to introduce new models of printers for both office automation and heavy duty applications in order to further extend its range of printers. It also proposes to introduce new tape drives with higher capacity in different storage formats to strengthen its leadership in this segment in addition to new models of power supplies to complement its current models. * 9 months.

introduction of its new products the company will have the most comprehensive printer range amongst all the printer manufacturers in the country. TVSE has signed a technical assistance agreement with Oki Electric Industry Company, a Fortune 500 company, for the manufacture of high speed dot matrix printers in India to be manufactured at the company's Tumkur plant, and marketed as the 'HD series'. Meanwhile, for the first six months of 1993-94, the company suffered a net loss of Rs 0.8 crore on a net sale of Rs 21.2 crore.

WARTSILA DIESEL

Hit by Recession

Incorporated in 1986, Wartsila Diesel has been promoted by Oy Wartsila Ab of Finland (in equity participation with Finnish Fund for Industrial Development Corporation), Shapoorji Pallonji and Company and Banaras House and is engaged in the manufacture of high power diesel generating sets (DG sets)/ engines in the range of 500 KW to 7,500 KW. With industrial recession continuing through most of 1992-93, process industries such as cement, fertilisers and chemicals were the worst affected. With these industries accounting for up to 72 per cent of Wartsila Diesel's installed base of captive power, the company's performance suffered in 1992-93. While net sales fell by 8.0 per cent over the previous year, operating profit fell drastically by 23.9 per cent and with a 14.6 per cent rise in interest charges coupled with a 25 per cent rise in depreciation provision, net profit fell by 37.4 per cent. Despite the fall in net profit the company has raised its dividend rate from 10 per cent last year to 15 per cent.

The company produced and sold 10 DG sets/engines in the range of 500 KW to 7500 KW during the year as against six produced in the previous period. The company would have been further affected but for the timely 32 MW export order to the Philippines received from its collaborator, Wartsila Diesel International. Though order intake improved in the latter part of the year when projects valued at about Rs 60 crore were contracted for, only a part of them could be converted into sales. The reduced industrial production and consequent reduction in running of the captive power plants also affected the performance of the services division.

Meanwhile the company began the year 1994 with an order backlog of Rs 50 crore and a number of new projects were under negotiation. With the expected growth in industrial output, power requirement is bound to increase substantially and the company expects the installed base of Wartsila Diesel captive power plants to cross 550 MW during the year (including a project for the Nuclear Power Corporation and others involving the large Vasa 46 engines).

Kashmir and A Farcical Human Rights Commission

A G Noorani

By his* ex cathedra *pronouncements on the relative responsibility of the militants and the security forces for human rights violations in Kashmir, Ranganath Mishra has confirmed the apprehensions expressed when the National Human Rights Commission was set up and his own appointment as its chairman was announced.

"MILITANTS are more responsible than the security forces for the human rights violations in Kashmir. The media is responsible for not focusing on the militant atrocities as much as they should be doing." This blanket exoneration of the security forces and sweeping attack on the media have come not from a politician belonging to the ruling party, the Congress(I), or the BJP but from one who is supposed to be chairman of a quasi-judicial body set up by law.

Ranganath Mishra has lost little time in confirming the suspicions widely expressed at the time when the National Human Rights Commission was set up and the fears voiced freely when his own appointment as its chairman was announced. His shoddy record as the Commission of Inquiry into the Delhi riots of 1984 was only one of the reasons for the fears. On what basis does he deliver this *ex cathedra* pronouncement? Has he or the commission conducted an investigation in Kashmir of a range and depth, both in point of time and area, which justifies expression of any opinion of so general a character? Another question which one hopes civil liberties bodies will press him and the commission to answer is whether it represents the commission's verdict or his own personal opinion.

The remarks were made in an interview to the weekly *Sunday* of July 3. Preceding the part quoted above were these observations by Mishra. Asked specifically about Kashmir, he declaimed: "It is a sensitive issue. There is a national aspect." These are standard euphemisms used by politicians in power and journalists close to them to suggest that it is unpatriotic to criticise the government's policies or the misdeeds of the security forces. Mishra continued: "The admitted position internationally is that Pakistan has a hand in it. We talked to 100 arrested militants in Kashmir and came across 21 militants in detention. There were Afghans, one Palestinian and one Jordanian. They come, pick up people, train them for three to four weeks in POK. Crossing the line of control usually takes place at night, when they can escape attention. It becomes difficult for the BSF to actually see what is happening."

Granted that the statute confers on the HRC jurisdiction in respect of *specific* violations of human rights by terrorists. But it gives no jurisdiction to deliver such a general verdict, however true it may be. What is Mishra's source of knowledge? And the means of investigation? The BSF in a conducted tour, no doubt.

The interview was published on July 3. Exactly a fortnight later on July 17, *The Hindu* published a despatch by its correspondent in New Delhi, Amit Baruah, which quoted Ranganath Mishra as saying that "Mr Shankar Sen, an officer holding the rank of DGP, would be visiting Jammu and Kashmir to investigate the complaints received by the commission during its recent visit to the state". What is the worth of this official's probe when the commission's chairman has already pronounced his opinion? Incidentally, will the other members of the commission pull him up for this? It is hardly likely.

But, of course, there is a purpose behind the Sen mission. It is to find material to refute Amnesty. Amit Baruah's despatch continues: "Also, Mr Sen would hold an independent (*sic*) inquiry into some of the cases quoted by Amnesty in its India section [of its Annual Report] alleging violations in Kashmir, Mr Justice Mishra maintained."

The cat is out of the bag. Why does Mishra pick only on the Kashmir portion in the India section of Amnesty's Annual Report when there is ample material also on the other parts of India? Is it because Kashmir has a 'national aspect' and the commission's exoneration of the security forces will help the 'national' cause?

No one was fooled when the commission announced *suo motu* that it would look into the Bijbehara outrages or when it published its findings. The exercise was necessary in the larger interest of the commission's credibility when it exonerates the government. As Ravi Nair of the South Asia Human Rights Documentation Centre noted: "A close reading will show that it [the commission] has done precious little beyond the internal BSF enquiry and the magisterial probe. It is nothing but a post office function" (*Sunday*, July 3).

The commission spent a mere two days in the Kashmir valley on June 5 and 6. It received "nearly 20 complaints of human rights abuses including custodial killings and reports of missing persons" according to Mishra as reported by the UNI (*The Times of India*, June 7).

The report continues: "He said the most common complaint related to the people whose whereabouts were not known *after they were picked up by the security forces during search operations and raids*. All such cases would be sent to the state authorities to ascertain their viewpoints before conducting detailed investigations, he added" (emphasis added). This was said on June 6. Three weeks later Mishra speaks to *Sunday* exonerating the security forces and his interview appears on July 3. What is *his* credibility now?

The UNI's report in *The Times of India* continued "Mr Mishra and other members of the commission expressed ignorance when asked if they had received complaints of dozens of custodial deaths in Char-e-Sharief, Pulwana, Kupwara and Anantnag. However, they urged media persons to provide full details about these killings for a thorough probing by the commission." Three weeks later, as we noted, Mishra attacked the media. On June 6, Mishra himself characterised the human rights situation in Kashmir as "serious".

Exactly a week later, on June 13, once back in New Delhi, Mishra declared: "In Jammu and Kashmir, instances of violations [of human rights] are more by the militants than by the security forces. *The other problem is that once the security forces pick up someone it is difficult at the time to find out whether the person is innocent or involved in militancy* (*The Hindu*, June 19, emphasis ours). The implications of the italicised words are as obvious as they are shocking. No wonder the man exonerates the security forces. The outlook reflected in the italicised words would lead to that conclusion.

Words apart, Ranganath Mishra's conduct itself reveals him in a sorry light. *The Statesman* twice criticised him for asking the chief minister of Punjab for a grant for a college. In its editorial of July 17 it referred to him as "eminently famous for his belief that the 'woman's place is in the home' and for his role in the inglorious Delhi Riots Commission" and drew attention to his asking "Mr Beant Singh to grant Rs 65 lakhs for a Sanskrit College in Bhatinda by virtue of his being the chairman of the Central Sanskrit Board."

On July 21 Doordarshan showed Mishra on the platform with Salman Khurshid, minister of state for external affairs, at a conference on 'Human Rights and Terrorism' and quoted both Khurshid and Mishra. Oddly enough press reports the next day omitted Mishra's remarks in condemnation of terrorism. The question remains: What was he, chairman of a quasi-judicial body, the National Human Rights Commission, which is charged with the duty of holding the scales even between the state and even the most wrong-headed of citizens doing at such a function? Do you blame the Kashmir Bar Association for boycotting the commission when it visited the state and calling it a "joke"?

In Defence of India

Supreme Court and Terrorism

K Balagopal

The Supreme Court's judgment on TADA in the Kartar Singh vs State of Punjab case has taken the law back to the pre-1978 days, though, to be fair, this is not the only occasion when the Supreme Court has set the calendar back.

JUSTICE Ratnavel Pandian's judgment (on behalf of the majority) in Kartar Singh vs State of Punjab has set the Constitutional seal on TADA. It is a poorly written judgment, poor in language—because it is poor in judicial philosophy and not merely because of the judge's poor command of English—poor in logic and poor for its unwillingness to follow the path opened up by the Supreme Court in 1978 in Maneka Gandhi vs Union of India. Justice Sahai, in his dissenting judgment, says of the Additional Solicitor General's arguments in defence of TADA that "if they are accepted, that will result in taking the law back to A K Gopalan", i e, the Supreme Court's view in A K Gopalan vs State of Madras, 1950. The judge is too polite to say the same of the reasoning of 'brother Pandian' whose erudition (of which there is really little trace in the judgment) he praises copiously. But his comment applies equally to the majority judgment, with which he too is in significant measure in agreement. Without at any point saying so, it takes the law back to the pre-1978 days, though, to be fair, this is not the only occasion when the Supreme Court has set the calendar back.

Terrorism is a reality, and just such a reality as the union home ministry says it is, and none other; a special law for terrorism is therefore based on a reasonable classification. That takes care of Article 14. The procedure and substance of the new law is 'just and fair' as required by the Maneka Gandhi judgment, for no reason other than that a parliament competent to enact the special legislation for the special circumstances has enacted it, and once the reasonableness of the classification of the special situation is accepted, you cannot complain that the special procedure denies rights that you had under ordinary procedure. (That the special procedure can be questioned not for being special but for being arbitrary and unreasonable is a distinction emphasised by the Maneka Gandhi judgment, which Justice Pandian does not recognise.) And as nobody who argued the case has contended that TADA violates Article 19 or any other fundamental right, there is nothing left to be vindicated. This about sums up the Constitution Bench judgment on TADA.

Two judges out of the five have dissented, and have crafted evidently better argued—though excessively cautious—judgments. If the composition of the Bench had been slightly different then it is possible that at least some of the more obnoxious provisions of TADA, such as the admissibility of confessions made to policemen of rank SP or above (sec 15), the conferment of certain judicial powers on executive magistrates (secs 20(3) and 20(4)), and the oppressive prerequisites for the granting of bail (sec 20(8)), would have been struck down by the majority. Nevertheless, TADA is now a fact of life for the people of this country, for as long as the government of India wishes to extend its life, which could well be indefinitely. I say 'people of this country' rather than 'terrorists of this country' advisedly, not only because TADA is being extensively misused, but also because even if it is properly used, the 'terrorists' who are its victims are not some specially vicious subspecies of Indians, but the very citizens that justice has to specially protect: the people peripheral to the mainstream of social, political, ethnic and economic life of this country, no matter that they may be misguided, misled or wilfully mischievous.

A court that does not possess a social understanding of the ugly thing called terrorism cannot possibly look critically at the provisions of TADA. A court that understands terrorism the same way as the union home ministry (as Justice Pandian and his brotherhood unabashedly do) cannot look at TADA in the spirit of the best values expressed by the Indian Supreme Court in the past. A court that does not begin to make sense of the striking fact that the terrorists and extremists of India—Sikhs in Punjab, Muslims in Kashmir, tribal people in the north-east, the wretched of rural Bharat in Bihar and Andhra Pradesh, expatriate Jaffna Tamils in Tamil Nadu, and in recent days disillusioned Muslim youth in various urban centres—are all from the political, social, ethnic and economic periphery of Indian society, cannot begin to see what it means if suspects in 'terrorist' crimes are denied rights that mainstream criminals possess. Democracy in the best sense has always meant justice for the dissident, the abnormal, the peripheral, notwithstanding that their proclivities may be held morally unjustifiable and politically unsupportable by the mainstream, or even a majority of the periphery too. Only a court that values such a justice can look properly at TADA. A court that thinks justice is another name for the securing of public order cannot.

Heinous crimes have no doubt been committed by the armed groups espousing these causes, especially but not only in Punjab. Bus passengers and train commuters have been killed, passers-by have been massacred in the streets in random firing, and in every part of the country armed groups have killed 'peoples enemies' and 'police informers' without any procedural justice or substantive norms. Whatever the pros and cons of the need to resort to armed struggle in certain situations, the armed groups operating in India certainly need to learn basic lessons in fairness and justice.

Images of Terrorism

But the discussion of terrorism cannot begin and end there. Nor can it end up with foreign conspiracies to dismember the nation, a particularly unconvincing explanation of the phenomenon that the state propagates ceaselessly. Justice Pandian's recital of the "background and circumstances" attending the enactment of TADA is startling for more serious reasons than the judge's very indifferent prose. Terrorism and disruption are "a world-wide phenomenon and India is no exception". The country "in the recent past has fallen in the firm grip of spiralling terrorists violence and is caught between the deadly pangs of disruptive activities". Having begun in Punjab, "at present they have outstretched their activities by spreading their wings far and wide almost bringing the major part of the country under the extreme violence and terrorism by letting loose unprecedented and unprovoked repression and disruption unmindful of the security of the nation, personal liberty and rights inclusive of the right to live with human dignity of innocent citizens of this country and destroying the image of many glitzy cities like Chandigarh, Srinagar, Delhi and Bombay by strangulating the normal life of the citizens... there were countless serious and horrendous events engulfing many cities with bloodbath, firing, looting, mad-killing even without sparing women and children and reducing those area into a graveyard which brutal atrocities have rocked and shocked the nation". These "stark facts and naked truths" cannot be denied by adopting an "ostrich-like attitude completely ignoring the impending danger". This is the Supreme Court speaking, not K P S Gill.

It was in these circumstances, the judge says, that parliament "has been compelled to bring forth" special anti-terrorist laws to "sternly deal with many groups lurking beneath the murky surface aiding, abetting, nourishing and fomenting the terrorists". The rhetoric is truly torrential, and would do the home ministry proud. The "totality of the speeches made by the ministers and members of parliament during the debate in parliament, the Statement of Objects and Reasons, and the submissions made by the learned Additional Solicitor General of India" (it is a quaint fact that the Additional Solicitor General is always referred to as 'learned' in the judgment, but the opposing counsel are frequently plain 'Mr', devoid of the traditional epithet) are accepted uncritically by Justice Pandian and his judicial brothers as "facts of common knowledge and authenticated report" which the courts can take into consideration "to sustain the presumption of constitutionality of a legislative measure", though in fact you soon discover that they do not just sustain the presumption but fully establish the constitutionality of TADA in Justice Pandian's eyes. He says that the "Court can take into consideration matters of common knowledge, matters of common report, the history of the times" and also can (if you can make sense of this) "assume every state of facts which can be conceived existing at the time of the legislation" as (quotes he approvingly) the High Court of Punjab and Haryana said in a full Bench judgment in 1987. One does not have to be a post-structuralist to find this celebration of "matters of common knowledge", "history of the times" and "existing facts" alarming. Granting the epistemological legitimacy of the notion of a fact, its actually and knowability, and granting also that taking into account facts of common knowledge in arriving at judicial conclusions is neither a novel idea nor an unreasonable one, one may nevertheless object to the notion that 'facts' about terrorism are what the home ministry and the Additional Solicitor General (however learned) say they are.

The 81-page judgment therefore ends on page 8 where all the "facts" and the "matters of common knowledge and report" are set out, down to the last sharpened claw and spread out wing of terrorism. For these uncontroverted facts constitute a special situation, and a parliament competent to legislate specially for well-defined special situations has in its wisdom produced TADA, and that is that. But the edifice of the judgment has nevertheless to be fully built. That is a professional requirement, and so the rest of the judgment needs to be written. The blame cannot however be wholly put at the door of Justice Pandian and his judicial brothers. It appears (I would like to be corrected if I am wrong) that the lawyers who contested the vires of the statute did not challenge the "history of the times" and "the matters of common knowledge". They seem to have conceded the terrain of history and sociology to the Additional Solicitor General, and fought their case with arguments about parliament's lack of legislative competence; the unreasonableness of the classification of terrorist and disruptive offences; and the unfairness of the procedure prescribed for charging and trying these offences. This self-imposed restriction is partly reflected in the surprising fact that TADA has been challenged only for violating Articles 14 and 21, whereas in its very fundamentals it violates the political freedoms guaranteed in Article 19. Indeed, it violates the very crux of a democratic Constitution which is premised on freedom of political choice as a matter of right, a freedom that is certainly part of the basic structure of the Indian Constitution as much as parliamentary democracy or an independent judiciary.

The voluntary imposition of this restriction—which should no doubt be put down to the caution that these difficult times appear to mandate even to the most courageous—does not make the effort altogether worthless, as witness the dissenting judgments of Justices Ramaswamy and Sahai. But Justice Pandian has a few more arguments up his sleeve. He first defends the legislative competence of parliament to enact TADA with the contrived argument that it concerns neither "law and order" nor "public order", but the defence of India, which is a subject within the legislative competence of parliament. But in that case it is difficult to see why everybody who commits a crime to overawe the government or to alienate any section of the population should be called a terrorist, as does section 3 of the act, for such a person may be entirely patriotic and full of zeal to defend the country's borders against all external intruders. The court cannot get away with the argument that what is relevant for deciding the legislative competence is the "pith and substance" of the act and not the whole of it, for sec 3 is very much central to the "pith and substance" of TADA. But in truth, the notion that TADA is concerned with the Defence of India has nothing to do with the actual text of the statute, but is an ideological presentation of the act, in tune with the general ideological representation of 'terrorism' as a foreign-inspired disease. It is sad that the Supreme Court should voluntarily become part of this ideological campaign of the Indian state.

Next Justice Pandian defends the reasonableness of the classification of offences made by TADA on the ground of the "matters of common report" and the "history of the times" that have been conceded by both parties. As we shall see below, once we question TADA in the light of the freedom of political choice (implicit in Article 19) and in the course of that effort look critically at the "history of the times" as stated by the home ministry, the reasonableness starts looking shaky. And finally, Justice Pandian defends the new procedure laid down by TADA as just and fair on the ground that it meets the stated aims of the legislature. He quotes approvingly a 1952 judgment of the Supreme Court upholding the validity of an impugned section of the Bombay Police Act: "It is true that a procedure different from what is laid down under the ordinary law has been provided for a particular class of persons... but the discrimination if any is based upon a reasonable classification which is within the competence of the legislature to make. Having regard to the objective which the legislation has in view and the policy underlying it, a departure from the ordinary procedure can certainly be justified as the best means of giving effect to the object of the legislature". He also quotes a 1951 judgment of the Supreme Court which said that "the presumption is always in favour of the constitutionality of an enactment since it must be assumed that the legislature understands and correctly appreciates the needs of its own people and its laws are directed to problems made manifest by experience and its discriminations are based on adequate grounds". But granting the reasonableness of the classification of a new category of offences, and also the need to depart from normal procedure to that end, the test of "just and fair" procedure cannot be answered by the argument that the procedure is best suited to give effect to the object of the legislation, and parliament knows best how to make adequate laws. That would defeat the whole logic of the Maneka Gandhi judgment. Bhagwati said quite explicitly in that judgment that the equal protection of the laws guaranteed by Article 14 cannot be merely reduced to the requirement that any legal classification of persons or situations must be based on reasonable grounds. Legal equality, he said, is a guarantee against arbitrariness. In his oft-quoted words, "the principle of reasonableness... which is an essential element of equality or non-arbitrariness pervades Article 14 like a brooding omnipresence". And any procedure by which a person is deprived of life or personal liberty must stand the test of this reasonableness or non-arbitrariness required by Article 14.

It is true that the Supreme Court has on occasion reverted to a traditional mode of interpretation of the right to life and liberty in post-Maneka Gandhi cases such as A K Roy vs Union of India, 1982. But if (as Justice Pandian thinks) that logic is sufficient to answer the requirement of Article 21, then the least the Supreme Court could do is to stop quoting the Maneka Gandhi judgment and overrule it once for all, for that at least would make it clear to the people where their rights stand in the eyes of the highest court of the land. That logic, however, goes entirely against the ratio of not only the Maneka Gandhi judgment but also that of a number

of judgments given by the same court in the 80s concerning many matters, such as for instance prisoners' rights. That a prisoner cannot enjoy the same rights as a free person, and that a sensibly distinguished high-security prisoner cannot enjoy the same rights as an ordinary prisoner are reasonable propositions, but yet the court refused to accept that therefore any procedure lawfully enacted to confine prisoners securely is a "just and fair" procedure merely because whichever legislative or administrative body has in its competence made the rules knows how best to achieve the purpose for which the rules are intended.

Suppose for the moment that terrorist and disruptive activities constitute a sensibly distinguished class of offences. Does it necessarily follow that there can be nothing arbitrary, oppressive and fanciful about prescribing a maximum of one year as against the normal 90 days as the period up to which the prisoner's remand can be continuously extended by the Designated Court? Why one year? What is it in the definition of TADA offences that makes it reasonable to multiply the required period of investigation by a factor of four? The Supreme Court may not permit itself to weigh each and every difference in procedure, however minute, to see whether the deviation is justified. But certainly the court is entitled to take note of departures from normal procedure that are beyond reasonable explanation, that are fanciful or exaggerated? Or the institution of a new procedure that violates natural justice, and is unjust or unfair? This much is surely implied in the dictum of the Maneka Gandhi judgment, supposedly accepted ever since by the Supreme Court, that the law referred to in Article 21 must be a reasonable law, and not "any enacted piece", in V R Krishna Iyer's words? It can certainly be argued that reasonableness entails not merely reasonableness of the categorisation of the new class of offences, but also reasonableness in the deviation of the new procedure from the procedure applicable to the normal offenders, and also inherent reasonableness and fairness of the new procedure? It would have been good if the Supreme Court had considered this view explicitly and decided against it, instead of rejecting it implicitly.

What, similarly, is the rationale for allowing certain hitherto unknown judicial functions to executive magistrates? It cannot be in the interest of speed as claimed by the government, for (and this is truly a matter of common knowledge and report) in all states of India, every seat of a judicial magistrate is also the seat of an executive magistrate and vice versa. The one is not unavailable where the other is available. So there is no convenience of speed in allowing executive magistrates to do judicial jobs. On the other hand, the innovation can be suspected to hide the mala fide intention of in fact bypassing judicial scrutiny, for executive magistrates are notoriously (and this too is a matter of common knowledge) much more amenable to executive interference than judicial magistrates, and indeed increasingly there are many instances where police officers themselves possess powers of an executive magistrate. Special executive magistrates too can be appointed at will by the government without judicial consultation. Does not the procedural innovation then suffer from harmful and oppressive possibilities?

Justice Pandian's answer is that the separation of the judiciary and executive is not absolute in the Indian state, though Article 50 of the Constitution (a Directive Principle of State Policy) says that the state should endeavour to separate the two. He quotes various provisions of the Cr PC under which executive magistrates have been performing judicial functions. But what does this mean? It only means that the Indian government has made no serious effort to give effect to Article 50. That being only a directive principle, the courts cannot force the government to implement it, but surely the courts can prevent the government from moving farther away from the directive principles? If it is not mandatory to legislate the directive principles, is it not nevertheless impermissible to legislate contrary to them? Especially when procedural fairness and justice in criminal investigation and trial which impinge upon the fundamental right to life and personal liberty are involved?

Bail Provisions

The argument in defence of the bail provisions of TADA is the most shoddy part of the Kartar Singh judgment. The notion that a person accused of a crime is to be treated as innocent until the guilt is proved is built into the Criminal Procedure Code. While a magistrate's power to release a prisoner on bail is curtailed in cases where the punishment is death or life imprisonment, there is no such curtailment of the authority of the sessions court or high court, to which the accused can always have recourse if the lower court rejects the bail application. Under TADA, the designated court is to release the accused on bail only if there is reasonable ground to believe that he is not guilty, and also that he will not again commit a similar crime if released on bail. And there is no higher court which has unfettered power to release the accused on bail. What Justice Pandian does is to justify the restriction placed upon the bail-granting power of the designated court by saying that it is similar to the restriction placed by the Cr PC in normal cases upon the bail-granting power of the courts lower than the sessions court, ignoring the crucial fact that such a restriction is compensated by the unfettered power of higher courts under the Cr PC, whereas under TADA there is no higher court whose power to grant bail is unrestricted. This is plain enough from the statute, and was made explicit six years ago by the Supreme Court in Usmanbhai Dawoodbhai Memon vs State of Gujarat, 1988, with which opinion Justice Pandian says "we are in full agreement".

The judge further says that the provision in Cr PC which says that while granting bail the sessions court or high court may impose conditions on the prisoner with a view to ensure that he or she will not commit a similar offence is a provision of the same nature as the restriction in TADA that bail should not be given unless there is reasonable certainty that the accused will not commit a similar offence again. The judge must be charged with extremely loose thinking. The provision in Cr PC is a restriction imposed upon the liberty of the accused (such as that the accused shall not visit the place of occurrence of the offence without the court's permission) after the prisoner's liberty from prison has been granted, whereas the provision in TADA is a pre-condition for the granting of liberty. There is a whole world's difference between the two, which the Additional Solicitor General has described and the Supreme Court has accepted as being similar in nature. Way back in 1988, in Bimal Kaur vs Union of India the Punjab and Haryana High Court had described as obnoxious the condition that bail should not be granted without reasonable certainty that the prisoner will not repeat a similar offence, and had declared that bit of TADA ultra vires. The Supreme Court has now restored it to constitutional status with this entirely specious analogy.

But apart from the speciousness of the Supreme Court's logic there is another reason for regarding the bail provisions of TADA unconstitutional. To say that a person who is not yet convicted of an offence should be denied bail on the ground that he or she may commit a similar offence if released amounts to putting that person in preventive detention. The bail provisions of TADA therefore effectively make it a preventive detention law as well as a penal and procedural law. But under the Constitution a preventive detention law must necessarily follow the procedure mandated in Article 22, which TADA does not follow. There is no provision for an Advisory Board and a review by it of the detention in TADA. The bail provision of TADA thus is a violation of Article 22.

This is not just a technical argument. It goes to the heart of the oppressive character of TADA in one aspect. The police have been using TADA essentially as a preventive detention law, which is not what it is supposed to be, and which it cannot be, in view of Article 22. It is a common complaint of the Indian police that courts are too lenient in granting bail (which is not uniformly true) and therefore there is no adequate deterrence to crime (it is this deterrence rather than investigative convenience that they habitually link their complaints about bail with). 'We

catch hold of hardcore criminals with great difficulty, and the Courts release them on bail in much less time than it takes us to catch them', is a frequently heard grouse. They would like to see that suspects, once apprehended by them, stay in jail until the case is decided, which eventuality can be postponed indefinitely, by filing multiple cases against each such suspect, implicating large numbers of (preferably inaccessible and underground) associates in each case, and thereby dragging the trial (or rather, the complex of trials) endlessly. The police are perfectly adept at keeping people in endless preventive detention under purportedly punitive laws provided only bail is difficult to get. If the Supreme Court does not know this, it knows nothing of the task of the judiciary in India. It is not enough to know the "facts of common knowledge and report" about the terrorists. There are such equally authenticated facts about the police, which too the courts should be aware of and take into consideration while judging the vires of penal procedures.

Now that the police have a law after their hearts in TADA they are happily putting people behind bars to stay there for long periods without any offence being proved. And given the political nature of TADA offences (TADA is essentially a criminal law for the newly-defined category of political offences, a fact that should have been, but unfortunately has not been, the starting point for the arguments of the lawyers challenging the act), the political establishment too is more interested in shutting up the suspects and putting society out of their harm's reach, rather than trying them and punishing them for each individual crime. If one were not burdened by a philosophical suspicion of post-structuralist excesses, one would describe the whole structure of TADA and its designated courts as an elaborate political game coded in penal and judicial language. But that way of looking at it is of little help in salvaging the valuable principles of natural justice and substantive and procedural fairness that are not part of any cognitive code, but are real legacies of past struggles for democracy, equality and justice.

Confessions as Evidence

As far as procedure goes, the most obnoxious provision of TADA is sec 15(1) which says that confessions made by an accused to a police officer of rank SP or above are admissible in evidence in the designated court. Justice Pandian's reasoning for reagrding this provision as not violative of Articles 20(3) and 21 is typical of his entire mode of reasoning. He confesses that he too was at first tempted to "share the view of the learned counsel that it would be dangerous to make a statement given to a police officer admissible", but he has overcome the temptation in view of the "legal competence of the legislature to make a law prescribing a different mode of proof, the meaningful purpose and object of the legislation, the gravity of terrorism unleashed by the terrorists and the disruptionists endangering not only the sovereignty and integrity of the country but also the normal life of the citizens, and the reluctance of even the victims as well as the public in coming forward, at the risk of their lives, to give evidence", and therefore holds the relevant section of TADA perfectly constitutional. In other words there is a special situation prevalent in the country whose nature is undisputed and a matter of common knowledge, and a parliament competent to make the required law has made such a law to serve the required purpose, which is a meaningful purpose, and that is all there is to its constitutionality. It is a matter of minor redemption that both Justice Sahai and Justice Ramaswamy, in their dissenting judgments, have held this provision unconstitutional, and in doing so have made an elaborate discussion of the problem of police torture, which should in truth be central to any consideration of statutory provisions such as 15(1) of TADA. The view of the majority however is an expression of a barely concealed cynicism: 'because these terrorists will not allow witnesses to depose against them, the only way out is to beat them up and extract confessions and treat that as evidence'. Such a cynicism is unworthy of the highest judicial body of the land. As for armed groups not allowing anyone to depose against them, this is a general problem faced by criminal courts whenever powerful persons are involved, except that nobody sees it as a problem when the source of the power is a dominant position in society. It is only when the power stems from a rebel's gun that it is seen as a problem. But when society has reached a stage where social and political rebels of whichever variety take so easily to guns—a stage that Indian society has certainly reached—the problem of effective conduct of criminal trials cannot be divorced from basic problems of justice in the socio-economic order, and cannot be solved by a facile recourse to an implicit sanction of police torture.

At the other end of the spectrum is this seemingly miserable little right for the accused defended by some of the lawyers challenging TADA: that when a case is transferred from one designated court to another, whether within the same state or outside, the objections if any of the accused must be mandatorily taken into account before the transfer is effected. It seems a harmless enough right to ask for, but the Supreme Court is not moved. Section 11(2) of TADA as it stands says that the transfer is to be effected with the concurrence of the Chief Justice of India, and Justice Pandian leaves it to the Chief Justice to decide from case to case whether he wants to hear the accused. It is interesting to hear the weighty arguments employed by the Additional Solicitor General and silently allowed to pass by the court to obstruct the simple plea. The Additional Solicitor General says that under certain circumstances "the parliament is fully empowered to exclude the invocation of the rule of natural justice... having regard to the fact that the entertainment of any objection would only frustrate the proceedings and paralyse the meaningful purpose of the provision". This weighty argument (whatever its intrinsic worth) is evidently uncalled for in this simple situation where all that is being asked for is that when the Attorney General applies to the Chief Justice of India for permission to transfer a case, the accused concerned should also have a right to express their views, which views should be taken into account by the Chief Justice in arriving at a decision. Nothing need be 'paralysed' by this. But Justice Pandian does not confront the proposition that rules of natural justice can be set aside so cavalierly as this. Instead he argues that the very fact that the concurrence for the transfer is to be given by none other than the highest judicial officer in the land who gives his opinion by "drawing the requisite subjective satisfaction on the reasons given in the application or any material placed before him explaining the exigencies of the situation" is sufficient to prove the bona fides of the lawmakers and to protect the rights of the accused. But what would be lost if the materials from which the Chief Justice is to draw subjective satisfaction include whatever reasoned objections the accused may have? As for the power to set aside natural justice, Justice Pandian says nothing about its applicability to this—or any—situation, but adds magnanimously that notwithstanding such a power that parliament may have, the Chief Justice may, from case to case, allow the accused to express objections, a discretion that is in any case not excluded by the act itself. Such a miserly attitude towards civil liberties is unusual, to say the least. It has been customary for Indian courts that whenever they deny major rights or substantial relief, they add the spiritual balm of subsidiary minor relief, but the majority in Kartar Singh vs State of Punjab is implacable in its resolve not to allow the sharpened claws and outstretched wings of the terrorists any quarter whatsoever. It is a pity that Justice Pandian and his brothers have never seen, and do not possess the imagination to visualise, who these terrorists are whom they have so ruthlessly put outside the protection of the Indian Constitution.

In arguing the case for the constitutionality of TADA, the state has frequently resorted to—and the court has at more than one point approved—a mode of argument that proves one apprehension that has often been raised and discussed in the civil liberties movement. There are many special statutes dealing with socially oppressive and morally obnoxious

offences. These are statutes dealing with smugglers, bootleggers, with crimes against women, crimes against scheduled castes and tribes, and crimes against public morality. Most such statutes include provisions that contravene some principle or other of natural justice. And the courts as well as democratic public opinion has allowed them to pass keeping in view the exceptional nature of such crimes. The apprehension of the civil rights movement has been that once an undesirable principle is laid down in the name of a desirable object, there is no stopping its extension to more ambiguous or plainly undesirable ends, especially since the discretion lies with the increasingly lumpenised legislatures and insensitive bureaucracies. The TADA case has proved the apprehensions true, and with a vengeance. TADA cripples the right of the accused to cross-examine witnesses by allowing the Designated Court to keep the identity of the witnesses secret, if it so wishes. This is certainly a violation of natural justice. But the Supreme Court in a 1973 case had said that rules of natural justice cannot remain the same in all conditions, and had justified the examination of witnesses outside the presence of the accused, and the denial of the right of cross-examination to the accused. But what was that case? It was a case where some men had entered and misbehaved in a women's hostel, and in the ensuing enquiry the institution's authorities had understandably decided not to allow the accused to be present when the women inmates were examined by the enquiry committee. The Supreme Court, with perfect good sense, had justified the procedure, and in the process laid down the principle that has now come in use to Justice Pandian to uphold the vires of the provision of TADA that takes the accused blindfolded through the trial.

Similarly, *in camera* trial as provided for in 16(1) of TADA is justified by Justice Pandian with the argument that such a provision is already there in the CrPC in the case of the offence of rape. About anticipatory bail too, the judge could have said that the SC and ST (Prevention of Atrocities) Act also excludes the right of anticipatory bail to upper caste persons accused of crimes against scheduled castes or tribes. But Justice Pandian finds an easier substitute in a strange argument: anticipatory bail is a new right introduced into the CrPC only in 1973, and therefore removing this right cannot be called a violation of personal liberty. He also relies, it is true, on an argument proffered by the Punjab and Haryana High Court in Bimal Kaur vs State of Punjab, that "persons accused of terrorist offences are members of a well-organised secret movement whom the enforcing agencies find it difficult to lay their hands on", and therefore it is all right to exclude the right of anticipatory bail for TADA offences. But this is an arbitrary reading of "facts of common report and knowledge" into the statute, whereas TADA itself says nowhere that to be guilty of a terrorist offence, one has to be a member of a "well organised secret movement". The assumption that all TADA *detenus* are such persons is one of the common images of terrorism that haunt judicial minds and mask the fact that the definition of a terrorist offence in the statute does not conform to what is imagined, and further also the fact that the majority of TADA *detenus* are not members of any secret movement at all, whether well or ill organised. After all, while granting anticipatory bail, the court is supposed to principally consider whether the applicant needs to go through the rigmarole of arrest and remand, or can be allowed at liberty without affecting the interests of justice while the investigation is going on. This discretion is essential to the provision of anticipatory bail, and is by its very nature a consideration that is applied from case to case. There is no logic in assuming beforehand that all persons accused of TADA offences are necessarily going to be underground activists—or slippery gangsters—whereas no such explicit presumption is present in the statute as a prerequisite for an offence to be a TADA offence.

Aside of that, the generalisation of principles of procedure that are violative of natural justice, from offences that are anti-social and immoral in character to a statute such as TADA that is pre-eminently aimed at dissenting politics, is an eventuality—as said above—apprehended by the civil liberties movement, and yet an eventuality that is difficult to avoid or evade and can only be lived with. It is evidently a consequence of the nature of law as an institution of the bourgeois state: its notion of fairness and equitability can only be formal and notional, and therefore insensitive to social hierarchies and unequal social and economic relations. To say this is not to pretend that there is an easy solution to the problem here posed: to conceptualise and institutionalise law in such a way that it will possess the bourgeois virtue of avoiding arbitrariness and unreasonable selectivity, and will at the same time be supple and flexible enough to be sensitive to the iniquities in social and economic relations; in other words to create a legal system that will be attuned to the requirements of social change but at the same time somehow be free from the possibility of unfair discrimination and partisan misuse. The post-revolutionary societies ruled by communist parties uniformly failed to solve this problem, and instead created monstrous legal systems in which the problem is by-passed and the law is made a handmaid of the party in power. Leave alone law and legal systems, any substantive—as distinct from formal or procedural—perfection in the arrangement of human affairs will perhaps long be an elusive ideal (whatever the utopian dreams of Marx) because the perfectibility of the human subject has inherent limitations. As a value and as a vision, one should of course go on dreaming with Marx in his more extreme moods that not only law, but philosophy, morality and all such objectified norms of human conduct will be abolished because they will coalesce with life and become part of the lived reality of human life, for it is such visions that make possible whatever degree of perfection is given to us.

Anti-Democratic Essence

We finally come to what is undoubtedly the anti-democratic essence of TADA: the fact that its classification of the new category of terrorist and disruptive offences includes politics as a defining element. In discussing this, we will perforce have to go beyond even the best of the Supreme Court's past pronouncements, for unlike the matter of procedural and punitive justice, in which the Supreme Court has made substantial contributions towards the protection of people's rights in the last two decades, it has behaved uniformly, conservatively and cautiously in the matter of freedom of political choice and political liberty as fundamental rights stemming from Article 19. The TADA case was a good occasion for charting out a new path in this matter, but neither the lawyers who challenged the statute nor the judges who sat in judgment over its vires saw it that way. TADA was challenged only for its procedural unfairness and was upheld—however dubiously—as procedurally fair. It was not challenged for being violative of the right to political freedom which is the essence of the political democracy that India proudly proclaims itself to be, and of course the Supreme Court's frame of mind leaves little doubt that if it had been, the challenge would have been received very inhospitably by the Bench.

But that need not deter a rational examination of the statute. When political activists take to violence in a systematic manner, the dividing line between politics and crime becomes quite thin, but that only means that a democratic legal and judicial system must be extra careful to ensure that it does not transgress its limits and encroach upon political liberty in the name of punishing and preventing crime. TADA, on the contrary, leaves no dividing line at all between politics and crime. A crime of violence committed with political intent is what a terrorist offence is, by definition, and to be an offence of disruption, no crime of violence is at all necessary. Mere political intent is a crime. Can that be a reasonable basis for classification of offences? Article 19 allows reasonable restrictions to be placed upon civil and political freedoms, but would it not be anathema to its spirit to classify crimes as political and non-political and to devise a new and oppressive procedure for the former? It is now supposedly accepted that

fundamental rights cannot be seen in isolation of each other, but must be seen together. A classification under Article 14 cannot therefore be repugnant to the right of political liberty, the freedom of political choice, that is implied by Article 19(1) (a), (b) and (c). If it is, it would not be a reasonable classification.

Yet, this is what TADA does. Section 3 of TADA defines a terrorist act as an offence of violence against person or property committed with a certain category of weapons, provided it is committed "with the intent to overawe the government as by law established, or to strike terror in the hearts of the people, or any section of the people, or to alienate any section of the people, or to adversely affect the harmony amongst different sections of the people". To overawe the government is certainly a political aim, and so is the aim of terrorising a certain section of the people or adversely affecting the harmony amongst different sections of the people, or alienating a section of the people. 'A section of the people', as used here, can only mean a social group, such as a class, caste, ethnic, linguistic or religious community. To strike terror in such a group or to alienate such a group may well be an obnoxious act, but it is a political act nevertheless. Even if, in principle, there can be non-political crimes that fall within the description of section 3 of TADA, the police have correctly understood the unstated major premise of TADA and are are using it only against political activists. Subsection 5 of section 3 makes things even more explicit. It says that it is a crime to be a member of a terrorist gang or a terrorist organisation, that is, a gang or organisation that indulges in terrorist actions. Taking this together with the meaning given to 'terrorist act' in the preceding subsection, what this provision says is that if you are a member of (i) a revolutionary communist organisation that believes in the forcible overthrow of the existing political order; or (ii) an organisation of dalits, muslims, christians, etc, that employs force to resist upper caste/Hindu domination; or (iii) an organisation of a linguistic or ethnic such as Nagas, Kashmiris or Tamils that employs force to resist or overthrow alien hegemony; then even if the organisation of which you are a member is not legally banned, you are guilty of a crime punishable by a minimum of five years' imprisonment and maximum of a life sentence.

The political nature of TADA—the fact that politics is a central element of the classification of crimes effected by this statute—is fully evident here. For, to be a member of a dacoit gang has always been a crime under the Indian Penal Code. What distinguishes a terrorist gang from a dacoit gang is not any qualitative difference in the nature of the offences committed (in both cases, the offence is a crime of armed violence against person and property, the difference being only in minor details), but the difference in the intention. The intention of the terrorist gang is political, whereas the intention of the dacoit gang is only pecuniary. And it is this political nature of the intention that forms the basis of the classification of a terrorist gang as a category different from a dacoit gang, with membership of the gang entailing a much heavier punishment and a much more illiberal procedure of investigation and trial. Can this be called a reasonable classification in a country whose Constitution guarantees the freedom of political choice implicitly as a fundamental right?

More generally, if you commit a crime of murder, arson, assault or abduction with lethal weapons, with a pecuniary or retaliatory or any such apolitical motive, then your crime falls in one category. If you commit the same crime of murder, arson, assault or abduction with the same weapons with a view to ultimately overthrow the capitalist state, or with a view to put an end to the oppression of dalits by the upper castes, or to protect the security and rights of Muslims or Christians, or with a view to enable the Mizos or Punjabis to separate themselves from the country, then the same crime (committed with the weapons) is in a different category. You are now liable for a heavier punishment and are tried by a distinctly more illiberal procedure. Is this classification of identical offences into separate categories according to the politics underlying the act, a reasonable classification in a political democracy, in a country whose Constitution guarantees freedom of political choice as a fundamental right, as the Indian Constitution implicitly does in Article 19(1) (a), (b) and (c)?

It is obviously not, and this is where TADA begins to be undemocratic and unconstitutional. Its procedural unfairness comes later. Since those who challenged the vires of the act did not approach the matter from this angle, the Supreme Court's answer to this mode of argument cannot be found in so many words in the Kartar Singh judgment. But it can easily be inferred from the outlook that informs the judgment. Like a magic puzzle that is simultaneously this as well as that, TADA keeps getting transmuted every second from its literal text to the images conveyed by the word 'terrorism'. Terrorism conveys images of blown up DTC buses, bits of flesh strewn in a bombed market place, Bihari workers mowed down in a Punjabi village, a khakhi-clad leg stuck high up a tree in the landmined Telengana countryside, a blood-splattered refugee camp in Mizoram, etc. The text of TADA contains none of this but is a straightforward piece of illiberal legislation targeted at militant political dissent (or even mere dissenting political opinion, in the case of ethnic groups or linguistic communities desiring freedom from India). But the legitimacy of the illiberal statute rests upon the images of blood and gore. That lay persons are easily carried away by this imagery is perhaps understandable but it is neither understandable nor pardonable that judges of the highest court of the land are unable to see that the "blood-bath, firing, looting, mad killing" that Justice Pandian is so eloquent about has nothing to do with the actual classification of offences effected by TADA, whose vires the Supreme Court is called upon to adjudicate. Justice Pandian imputes to TADA the aim of tackling "a grave emergency situation created either by external forces particularly at the frontiers of the country or by anti-nationals throwing a challenge to the very existence and sovereignty of the country in its democratic polity". The provisions of the act cast a much wider net than is implied by this imputed aim, which can itself be criticised both for being gratuitous and tendentious.

If terrorism had been defined as, let us say, mass and random killing as distinct from an ordinary murder in which a targeted X or Y is killed; or as setting off explosives or opening gun-fire in a public place; or derailing a passenger train wantonly; then at least the definition would be in accordance with the image of 'blood-bath and mad killing' used to justify the classification, even if one would still object to the unfair trial procedure. But what we have, on the contrary, is first of all rhetoric that brings to mind the sickening picture of bits of human flesh strewn in a Delhi market place, and then a definition of terrorism which says that if you kill X because you think he is an obstacle to your business then you are one category of criminal and are entitled to a civilised procedure of trial and norm of punishment, but if you kill the same X because you think he is an obstacle to the communist revolution, or to make an example of him to the brahmins, the rajputs, the marwaris, the bengalis or whoever you think needs to be given a scare to help liberate your caste/community/nationality, then you are a criminal of a different category, and you are entitled to only a rather uncivilised procedure of trial and norm of punishment. There can be nothing more scandalous than the inability of the highest judiciary of the land to see through this fraud of language and images played upon citizens and courts by TADA.

But as we go ahead from section 3 of TADA, which at least requires some explanation to enable one to see through its fraudulent nature, the intention of the legislature becomes even more plain in the subsequent sections. Section 4, for instance, says that if you merely propagate the opinion or even just encourage the opinion that, say, the Tamils or the Kashmiris are a people apart and should live apart from India, then you have committed the crime of disruption, for which the minimum punishment is five years and the maximum a life sentence. No

blood-bath, no mad killing, but mere holding or propagation of an opinion. It is also a crime of disruption to advocate, advise, suggest, incite or to predict, prophesise or pronounce (by act, speech or any medium) in such a way as to advocate, advise, suggest or incite the killing or destruction of any person bound under the Constitution to uphold the sovereignty and integrity of India: or any public servant whatsoever—and for the mere act of verbal, literal or pictorial expression you are liable for a minimum of five years and a maximum of life imprisonment. It is interesting that in this provision, "a person bound under the Constitution to uphold the sovereignty and integrity of India" is treated on par with "any public servant", for Justice Pandian makes an elaborate discussion of the distinction between law and order, public order and the Defence of India, and justifies parliament's legislative competence to enact a statute such as TADA on the ground that it is concerned neither with mere law and order nor public order, but nothing less than the Defence of India. Evidently, the act itself cares nothing for such niceties of distinction, for not every public servant is concerned with the sovereignty and integrity of India, and yet the act treats all of them on par.

But that apart, what this provision means is that whether a retrenched industrial worker aggrieved by the freedom to rationalise industrial workforce conceded by P V Narasimha Rao's structural-adjusting government wishes instant death to that old man, or the progeny of a poor labourer killed in police custody wail that a similar death may visit the policemen concerned, the mere expression of such a wish (with which many right-thinking people would sympathise) may result in penal charges under TADA entailing the uniform punishment for all TADA offences: five years to life imprisonment. The Defence of India, evidently, is a very demanding cause, but quite thoroughly out of tune with what is best about the Constitution of India. But Justice Pandian and his brother judges think otherwise. One should be pardoned for expecting the judges of the highest court of the land to understand that the Defence of India includes the Defence of the Constitution of India; and that the Defence of India is the Defence of India as a democracy. But unfortunately they have set these concepts one against the other and have ended up looking at the Defence of India the way a K P S Gill would. Natural justice and political freedom are therefore not part of the values and institutions that make up this India that is to be defended jealously. They are a luxury or perhaps a vanity of democracy that are to be ruthlessly superseded when the Defence of an India defined exclusively in terms of territory, security and order is endangered.

Financing Higher Education

Justice Punnayya Committee Report

M Shatrugna

The report of the Justice Punnayya Committee on financing of higher education highlights the need to review and restructure the norms for financing the education sector.

SINCE the 1950s higher education has been financed mainly by the central and state governments.

Table 1 shows that resource mobilisation from the private bodies and fees has dwindled over the years. Table 2 shows that the state governments' share in the plan expenditure is two-thirds that of the central government and that the share of the state governments in non-plan expenditure had touched 94 per cent by the Seventh Five-Year Plan.

Especially, after the inauguration of the New Economic Policy in 1991, there is a major change in the financial commitment of the governments towards higher education. While it is true that the expenditure on higher education has gone up over the years, the major expenditure has mostly been on the non-plan side covering the wage bill of the teaching and non-teaching staff. The so-called capital (development) expenditure has not been commensurate with the non-plan expenditure.

TERMS

The demand for higher education has been on the rise over the years from all sections of the society. With 'limited' resources at the command of the governments/UGC, the UGC in 1992 had appointed the Justice Punnayya Committee to go into the question of resources for higher education in the central universities, deemed universities and Delhi colleges and suggest measures to improve the financial position. The terms of the committee were among others, (i) to examine the present policy, norms and the pattern of providing development and maintenance grants to central universities, deemed universities, Delhi colleges and suggest measures and norms for determining grants in future (ii) to examine the inter-university variations in development and maintenance grants (per student, per department, and any other relevant criterion) with a view to developing objective parameters governing such grants (iii) to examine the pattern of utilisation of the grants (iv) to examine the pattern of allocation of grants between teaching, research and non-teaching functions and to suggest norms relating to expenditure on the above functions (v) to explore and recommend ways of improving overall cost efficiency of the institutions (vi) to study the extent to which the institutions are raising their own resources, and to suggest specific measures for augmenting the proportion of resource raising by the institutions (vii) to recommend incentives to institutions to raise a higher proportion of internal resources and to develop norms for utilisation of internally generated resources and (viii) to review the existing scheme of financial assistance for needy students such as free studentships, student loans and evolve a better scheme to assist students from disadvantaged sections of the community and promote equity in higher education.

The committee in its year's operation met and elicited the opinion of the vice-chancellors of the concerned universities, students, faculty, administrative and supporting staff and a number of educationists.

RECOMMENDATIONS

The UGC funds the universities in the form of block grants. This system, according to the committee, had robbed the universities of raising internal resources apart from the students fees which is insignificant compared to the expenditure. Further, 70 to 75 per cent of the expenditure is incurred on meeting the wage bill of the teaching and non-teaching staff. In practice, the income generated through fees, etc, is subtracted from the block grant before the grant is finalised. This method, the committee felt, acts as disincentive in mobilising additional resources at the university level. The committee, therefore, proposed that "the additional income generated should not be adjusted while determining the annual maintenance grant. Any additional resources generated by a university may be kept in a separate fund to be utilised for furtherance of the objectives of the University institutions" (p 6). For instance, the fees collected for 'entrance tests' may be kept in the university account after meeting the expenditure.

The committee further recommended that "the UGC may find a mechanism of providing an appropriate incentive grant, perhaps in the nature of a matching grant, as an incentive to universities generating their own resources". This suggestion is refreshing considering the weak financial position of the universities where no effort worth the name has been made to mobilise internal

resources. Going a step further, the committee asked the central government to explore the possibility of 100 per cent income tax concessions on all endowments and contributions made to the universities and additional concessions to donors sponsoring selected research projects in the universities.

The committee has assumed a number of basic premises on which it has built up cogent arguments. For instance, on the much debated issue of state subsidisation of higher education, though the society should subsidise education to a considerable extent, "access to higher education must be, in fact, made wider than now for the poorer students through tution waivers, scholarships and other means". Taking into consideration the historical background the committee unequivocally reiterated that "state funding must continue to be an essential and mandatory requirement to support higher education" (p 7). The committee has stressed that "...the state must continue to accept the major responsibility for funding the essential maintenance and development requirements of the universities". While trying to understand what ails the financial aspect of higher education, the committee found that whereas in the early 1950s, 15-20 per cent of the total expenditure was met from fees, now it has dwindled to 2-3 per cent (1992-93).

While dispelling the popular notion that higher education in the developed countries is met by private bodies, the committee found that fees formed less than 14 per cent of the total education expenditure in Britain, less than 4 per cent in France. For instance, even in the US, while the share of fees is less than 40 per cent in private institutions, it is less than 15 per cent in the public institutions. In other words, income from fees is limited even in the developed countries. To put it differently, income from fees rise has a limit. For a long time to come, higher education will have to be subsidised by public and private bodies.

Compare this view with the present policy of 'self-financing' institutions in the country where increasingly even the so-called middle classes of all castes are marginalised from seeking higher education. For instance in Andhra Pradesh, a self-financing like Master of Computer Science (MCA) will entail a fees of Rs 24,000 in a university college and Rs 45,000 in an unaided institution. The fees structure in the minority institutions is worse. The fees are so high that most of the seats are filled by non-minority candidates who can afford to pay the high fees defeating the objective of special provision to minority-run institutions as enshrined in Art 30 of the Indian Constitution. Experience in Andhra Pradesh has shown that these are money-spinning institutions paying lip-service to the education of minority communities.

Primary vs Higher Education

Since the inauguration of the New Education Policy (NEP, 1986) it has been argued that because of the increasing expenditure (plan and non-plan) on higher education sufficient funds have not been available for primary education. Further, as compulsory primary education is a directive principle of the state policy (Art 54), the state is entailed to reach that goal by providing sufficient funds. Since funds are 'limited', prioritisation requires that funds are to be diverted to primary education from other sectors of education including higher education. However, the chief reason for 'non-availability' of 'adequate funds' for all sections of education has not been admitted. But as early as 1964-66, the Kothari Commission on education while rejecting the 'primary vs higher education' argument as untenable had recommended 6 per cent of GNP for overall education. But even after 30 years, expenditure on the entire education sector remains at 3.9 per cent.

In a refreshing note, the Punnayya Committee emphatically maintained that "there is no denying, that while primary education is fundamental to the nation, higher education determines its economic and technological progress" implying that each level has a definite and important role. The committee further said "while it is mandatory that the nation achieves universal elementary education and total literacy, at the same time it cannot afford to neglect and relegate to a neglected position our quest to achieve global standards in higher education. The committee deprecates the tendency which views education in a truncated fashion and sets one sector against another" (p 18).

The committee while pleading for adequate subsidy for higher education has made a comparative study of the various central and deemed universities with regard to annual per capita expenditure, the ratio between teaching and non-teaching staff, etc. For instance, the committee found that in 1991-92 the cost per student per annum in Hyderabad University (all faculties) was Rs 22,965, in AMU 19,000, in BHU Rs 18,850, in JNU Rs 20,750, in Viswabharati Rs 14,690 and in Delhi Rs 12,370. But the weighted mean was only Rs 17,000 per student. Yet another interesting feature for the same year is whereas Hyderabad University had only 1,720 students enrolled, Delhi had 14,784, BHU 13,074 and AMU 10,891. Of the non-plan side whereas expenditure on academic administration in JNU was lowest at 78 per cent, it was 17.5 per cent for Hyderabad University. This lopsided expenditure for Hyderabad University for instance is understandable considering the political background in which the university was founded. The formation of the university, contrary to the understanding of the Punnayya Committee which believes that its creation lay "at the time of the foundation of the state of Andhra Pradesh" (p 19), it was the outcome of the separate Telengana agitation launched by the students in the late 1960s, where the demand for better and more education facilities was made. The 'regional dimension'

Table 1: Sourcewide Contribution of Finances to Education in India

(Per Cent)

Government Sector	1950-51	1960-61	1970-71	1980-81
1 Central and state governments	57.10	68.00	75.60	80.00
2 Local governments (zilla parishads, municipalities and panchayats)	10.90	6.50	5.70	5.00

of the demand was hijacked by the then chief minister Kasu Brahmananda Reddy and his party adversary Marri Chenna Reddy who in league with Indira Gandhi settled for a 'central university' as a substitute for more educational facilities at the lower level. The educational demands of the people of Telengana still remain the same even after the establishment of the Hyderabad 'central university'. Let alone serving the people of Telengana, the university of late has not even fully implemented the policy of reservation for weaker sections in several instances.

On the issue of teacher-student ratio the committee found that it was 1:9 in AMU, 1:98 in BHU, 1:10 in JNU, 1:8 in HCU and 1:9 in Viswabharati. The committee found the ratios to be academically unsound and had recommended a ratio of 1:2.

In a clear-cut indictment of the present policy of teaching and non-teaching staff pattern in the universities the committee found that there was no uniform norm evolved about the ratio between teaching and non-teaching staff. For instance, it was found that whereas the ratio was 1:4 in AMU, it was 1:5 in BHU, 1:3 in JNU, 1:5 in Hyderabad and 1:5 in Viswabharati. Once again we find that the Hyderabad University barring BHU and AMU has the dubious distinction of a high teacher-non teacher ratio compared to the older universities. The committee recommended that the teacher-non teacher ratio is to be pegged down to 1:3. The committee concluded that "funding of a university must have a direct relationship to its objectives and should be designed to promote quality, efficiency, autonomy, accountability and relevance" (p 14).

A very important observation of the committee is with regard to work-load of the teachers. Work-load has been a very contentious issue between the UGC and the teacher bodies for a long time. The committee felt that the work-load of university teachers should be on par with the work-load of teachers in the post graduate departments (of colleges). For those not having laboratory work, the committee had recommended a 40 hour per week work-load covering teaching, testing/examinations, tutorials, preparation for teaching, research/research supervision, own reading/administrative work. The work-load should be the same for all the categories of teachers, viz, professors, readers and lecturers with slight adjustments under various heads. For instance the teaching work for a professor is recommended at six hours, reader eight hours and lecturer 10 hours. Suitable adjustments are to be made for the science faculty. Actually, this formula was worked out by the UGC some years ago but as usual the norm is practised more in breach. It is well known that not only the central universities, even the state universities are over staffed. The staffing pattern has no relation with the work-load. It is common knowledge that as one is promoted, the work-load comes down drastically. We find several professors with less than three hours teaching work per week. The rest of the time they are either attending seminars and conferences or busy delegating their services to full-time administration work like becoming directors of all and sundry departments. No question are asked about their teaching work, the primary function for which they are employed. Only teachers/lecturers in the undergraduate colleges by and large follow the UGC norm of work-load.

About academic standards the committee had recommended the creation of academic audit cells and performance indicators on the lines prevalent in the UK. This appears to be a good suggestion considering the fact that in most of our state universities classes are not held regularly and there is no accountability for teachers. A high percentage of succe·-ful candidates as an indication of performance is also unreliable as marks are given liberally at the PG level.

The committee's recommendations are more or less the same in regard to the aided deemed universities. A notable recommendation is that the policy of grants to the deemed universities should be on the same lines as that of the central universities.

Finally, though the report covers only the central and centrally deemed universities and Delhi colleges, most of the observations and analysis are valid for the state government run universities as well.

In the light of the report, the state governments should in turn look into their own universities' finances afresh. This task can be performed by the state bodies like the state council for higher education, an apex body to "monitor and maintain academic standards". The council is also a conduit for transferring block grants to the state universities. Recently, the UGC has announced the set-up of five regional offices of the UGC. The state governments/state councils for higher education in collaboration with the regional UGC units should bring out similar reports covering funding, academic standards, etc.

Sometime ago the UGC had planned to create an accreditation system for universities to monitor standards. But the universities basically being conservative have not taken any initiative to work towards the accreditation system. The UGC while implementing the Punnayya Committee Report should simultaneously implement the accreditation system to make the universities accountable to the public.

Finally, the Justice Punnayya Committee while strongly supporting the state subsidy to higher education had at the same time called for a thorough review of the existing fees structure for various courses, hiking the charges in the student hostels, upward revision of charges with regard to services like electricity, water, etc. The implementation of the committee report will go a long way towards some sort of academic and financial discipline in our universities.

Maharashtra's Women's Policy

Co-opting Feminism

Gopal Guru

Through the women's policy, the Maharashtra government is attempting to incorporate certain elements of feminist ideology and neutralise its antagonistic potential.

TILL 1975, the international women's year, the question of women's emancipation was treated as a non-issue in the politics of most of the developing countries. However, since then the emancipation of women has become a part of the political agenda of these countries. In recent years, the Indian state seems to be focusing its attention on women's problem but rarely from the point of gender. Till recently the issue of gender in the Indian planning was subsumed under the social divisions such as class, ethnicity and religion with the assumption that these identities rather than gender defined access to the state. Recent attempts at the centre and by some of the states, particularly Maharashtra, have given the impression that the question of women's emancipation is being brought to the core of state's major concerns. The women's policy that the state of Maharashtra has recently announced has been hailed by the authority as the 'Magna Carta' while some of the women's organisations and activists (with Hindutva inclination) have by and large hailed this policy. However, some other women's organisations with left leanings have criticised the policy document and have expressed their doubts about the feasibility of implementing this particular policy. Some of these organisations have also pointed out the inherent contradictions in this policy but without any substantiation.

This mixed reaction from women is perhaps the result of the very dual nature of this policy. There are some positive aspects. For example, this document is seeking to change the Hindu law of inheritance (1956) into the one making both the boy and a girl to claim equal share in the inherited property of the family. (The Maharashtra government has recently passed on amendment to the existing legislation implementing this policy statement.) Besides, it also makes wife an equal partner in the property (landed and moveable) of her husband. This also offers women 30 per cent reservations at various levels and this provision if implemented sincerely would help in democraticising the political and bureaucratic structure which are male dominated.

But the kind of methodology that seems to have been used for selecting women for government benefits and the hidden meaning and the conceived truth in the policy document really warrant a critical examination of the pretensions of the state which now is projecting itself to be the champion of women's cause. This exercise revolves round four sets of questions: First, the state of Maharashtra seems to have assumed that the selected few women's organisations or activists which were directly or indirectly associated with the process of formulating this policy are the authorised representatives of women in the state. But there is plenty of room to raise the doubts as to what extent the claim of representation by these women is valid?

Secondly, the state government has claimed in the policy document that it is going to empower women by reserving for them a participator role in various levels of decision-making and jobs in service sectors, thus making them economically self-reliant. The state has thus made its intention clear—that it wants to reduce male domination in these sectors. The question is to what extent would the state be able to reduce the tensions between the social policies and state (male dominated) politics? Thirdly, the women's policy seeks to establish gender equality but it would be interesting to find out what implications this policy will have on the structures dominated by the caste and class forces? In other words, to what extent would this policy democratise the social structure in the state? Finally, on the one hand, Maharashtra has been continuously withdrawing from the social sphere by curtailing expenditure on various welfare schemes (the state government is seriously thinking of abandoning the Employment Guarantee Scheme which, according to rough estimate by Lal Nishan Marxist Party (Leninist), constitute about 60 per cent of the total working force engaged in this scheme). But on the other hand, it is announcing the most radical looking policies for women. How serious is the government about freeing women from its own domination and the domination perpetuated by the patriarchy? And finally, it would be equally important to know what implication it will have on the organised political expression of women in Maharashtra?

In the policy document, emphasis is laid on generating opportunities like providing vocational training, creating special agencies for access to market and meeting credit requirements for women's self-employment for empowering women. While it is necessary to create opportunities for self-employment, nowhere in the document is there a mention about providing employment on a regular basis, minimum and equal wages to men and women in the rural sector. Neither does the document take into consideration the question of education and health problems that rural women have to face. The policy document is silent about the problem of education, health and gender bias in the wage structure in the construction and brick industry in the urban sectors. Above all the policy document does not seem to be sensitive enough to take the cognisance of the dalit women engaged as sweepers and rag pickers. Since the basic approach of the government is individual progress through self-employment, the document is not expected to meet the needs of an ever increasing number of toiling women in the unorganised sectors.

Secondly, while the document rightly talks against the patriarchical domination and exploitation of women and it is necessary to confront the patriarchy, the policy has somehow missed the question of 'social patriarchy' which involves exploitation (both sexual and labour) particularly of dalit and tribal women by the village goondas, the local zamindars and the rich farmers. The question is why did the women activists who were associated with policy formation not pay attention to the problems of dalit and adivasi women in the state? Moreover, why did the problem of the vast mass of toiling women in the unorganised sector not figure adequately in the policy document except with reference to environment. Fetching fuel and water are important, but the question of women's survival with social prestige is more important. Is it the social location of women associated with this policy that has led them to limit their perspective to urban but educated upper caste women? Why were women's organisations working seriously at the grass roots level among the toiling women not associated with the process of policy formation? Why were the documents prepared by the grass roots organisations about women's problems not consulted by the study groups while making recommendations to the government? This question becomes extremely relevant if interpreted in terms of the ulterior motive behind this policy and the partial reality as perceived by the concerned women who due to their relatively better political visibility have received recognition from the state government.

The hidden meaning of the policy document seems to be related to short-term goal of the ruling party and the long-term goal of the ruling class. As it is rightly observed by some of the women's activists, the government has formulated this policy out of the need to enlist the support of women for the coming assembly elections. The state would also like to conceal the ruling class weaknesses that reflect its inability to genuinely intervene in social sectors and its willingness to succumb to foreign capital. The Maharashtra government has been very shrewd in using 'mock liberalism' to achieve these hidden goals.

Why Reservations

It is an open secret that in view of the rapid loss of jobs which would result from the government's new economic policy particularly the growing privatisation of Indian economy and the labour policies the 30 per cent reservation that the Maharashtra government policy is offering to women will not have much meaning as the private sectors is not enthusiastic about recruiting women on private farms, etc. In such a paradoxical situation the government of Maharashtra has announced job reservation but half-heartedly. Half-heartedly, because the government has not specified the location where this 30 per cent will be located. Government sources have ruled out this being an additional reservation outside the existing 50 per cent meant for SC/ST/DTNT/and OBC. One may argue (although the government does not) that the women from SC/ST/DTNT and OBC would be accommodated in their respective categories (if these women agree with the men's monopoly over the reservations) but where will women not from these categories be accommodated? Even if these women are accommodated in the jobs, will this put women into a commanding administrative positions? This seems to be a remote possibility because, as the study by Karuna Ahmed, Maitreyie Krishnaraj and Neera Desai shows, normally women in the government sectors are predominantly concentrated in teaching at the primary levels, nursing and in clerical jobs while a majority of dalit women are class four employees (mostly in sanitary divisions). In fact, the women's policy seeks to dismantle even these sectors by displacing women from their permanent jobs to temporary, contractual ones. Even the urban EGS scheme as mentioned in the policy document will displace dalit women from their permanent positions in the sanitary division as this job is to be allotted on a contract basis.

Even in respect of political reservations, which the document considers to be the effective strategy to empower women at various levels of decision-making. But the government has not worked out any mechanism which would establish conditions under which women would realise power without any compulsion of class, caste and gender domination. For the realisation of power a sense of self-assertion is very important. According to a woman panchayat member most of the women elected on panchayat raj institution either through reservation or directly have to act as proxy of their husbands or parents, co-operative 'kings' or the village lords. And if those women try to assert their legitimate sense of power or protest against the male domination, they are suppressed by men. In this connection an illustration of Pune ZP is quite shocking and revealing. In this particular Zilla Parishad, on June 24, 1994 (the date is significant because women's policy was announced by the state government on June 23) the women members of ZP belonging to Congress Party demanded representation on the 'water conservation committee'. But these women were told by the male Congress members, in an insulting tone that on these committees only the experts were elected. Reportedly the male Congress members used party discipline in order to suppress the protest of these women who refused to budge (*Loksatta*, Marathi daily, June 24). In such a situation one would opt for supporting reservations for women but not because it would help the women materially but it can neutralise their opposition to social categories specified for 50 per cent reservation. It may also neutralise the male opposition to women's reservation because given the opportunity these upper caste men would always like their relatively well-educated women to seek job opportunities which were kept out of their reach. Thus, at least theoretically, it seems that women's reservations can democratise social relations between women and dalits/adivasis and OBCSs but on the other hand, it can also subvert this democratic content by perpetuating upper caste male domination if the job reservation for women is implemented faithfully.

The state in its defence of this policy may argue that for empowering women it may not totally rely on the reservation policy and empower women with the self-employment opportunities. Will women become self-sufficient in handling these jobs? Given the disappointing experience with the women's development corporation in Maharashtra and also women's co-operatives this project of the government may not yield good results. Even if the government implements this plan it will bring women particularly from the unorganised sector under the control of male-dominated government ministries and bureaucracies which would control women through the licensing system providing market mechanism and finance to these women. Thus, it seems that the process of empowering women will be regulated and controlled by the state agencies.

If the government fails to cater to the needs of women then these women can become vulnerable to communal mobilisation by some of the Hindutva forces and the communal participation of women in the recent communal riots in Maharashtra is a case in point. Therefore, the question that needs to be confronted is why the state is projecting itself as a welfare state when it is looking for material ability to intervene in women's question? Normally, a welfare state formulates its social policies for transforming labour power into wage power but the present women's policy cannot be said to have this as its project. On the contrary it aims at locating women labour power outside the labour-capital relationship and seeks to displace women from the organised sector (tertiary sector). While the present chief minister of the state who claims to have taken this women's policy seriously has made it clear that various subsidies particularly in the social sectors have become a drag on the capitalist accumulation he knows that the capitalist system cannot survive without the welfare state. Therefore to defend this fragile phase of capitalism or its weaknesses have to be hidden from the masses; hence the need for the mock liberalism. The Maharashtra government would like to use the mock liberalism as a long-term strategy to perpetuate the illusion among the toiling women that the state still has capacity to tackle the problem, and secondly, it would like to control this labour power which is outside the process of production, just to ensure the availability of the catchment area of labour power though it cannot be transformed immediately into wage labour.

In such situation the women's policy of the government is in no way going to establish the concrete conditions for the implementation of this policy. Instead, the state is using the most radical looking language of the gender justice, integration of the women in the development process, empowerment of women and struggle against patriarchy. The state also seeks to define the substance of conflict by making 10 per cent village land as a contentious issue between women and the dalits and tribals who in most cases cultivate this land. This conflict is also defined by the state by locating 30 per cent job reservation for the women within the existing 50 per cent quota meant for SC/ST/DTNT and OBCs in the state. The Maharashtra government also defines the substance of conflict by differentially empowering educated urbanised elite women. And this empowering relevant social groups (rural-urban toiling women). In view of the absence of any concrete programme and an agency to implement it, the policy is likely to remain only on the paper.

However, at the moment the Maharashtra government feels comfortable in selling its 'mock liberalism' for the following reasons: The women organisations and activists organisations who seek to establish their own needs as the true needs will ultimately lead to facilitating the ideological process of political legitimation (of mock liberalism) that would function within the material dimensions of co-optation. In the recent women's policy the women's organisation have been assured by the state all help to carry out this mission of political legitimation designed by the state. Due to such a situation and also due to lack of any organised political intervention from outside these groups, the ideology of mock liberalism is bound to serve as an effective means of self-defence of the ruling class. It is clear that the ruling class is not imposing its ideology of mock liberalism but it is legitimising it through the incorporation of certain elements of

feminist ideology in such a way so as to neutralise its potential antagonism. It is quite clear that the state will use all these ideological means to maintain its hegemony. Women's force can thwart this game if they choose to use whatever little space that is given by this policy document to assert themselves against the state and patriarchal domination If they fail to do so the women's policy whether in Maharashtra or elsewhere will continue to limit the collective context of collective political possibility.

Creating Rural Employment

JRY's New Thrust Areas

Parameswaran Iyer

The pumping of extra funds into the backward areas under the Jawahar Rojgar Yojana provides a new opportunity for tackling unemployment and underemployment in these areas, provided supporting systems are shored up.

IN terms of resources, in a scenario where most ministries suffered cuts in the 1994-95 budgetary outlays, the ministry of rural development occupies high priority on the government agenda today. The outlay of the ministry went up by a whopping 40 per cent, up from Rs 5,010 crore in 1993-94 to Rs 7,010 crore in 1994-95. Out of this increased outlay, the lion's share of Rs 5,055 crore went to the rural employment sector, i e, Jawahar Rojgar Yojana (JRY) and its subschemes. If the states' share of 20 per cent were to be added, the total JRY kitty for the country in 1994-95 would be Rs 6,300 crore.

The JRY was started in 1989, by merging the two then existing employment programmes of National Rural Employment Programme (NREP) and the Rural Landless Employment Guarantee Programme (RLEGP) into a single programme—the JRY. Like its predecessors, the JRY is a centrally-sponsored scheme, the difference being that while the funding for the earlier two schemes was equally shared by the centre and states on a 50:50 basis, 80 per cent of JRY is funded by the centre and only 20 per cent by the states. Another major difference between the erstwhile rural employment programmes and JRY is that in the latter, 80 per cent of the combined central and state shares is released directly to 'gaon sabhas' to be utilised by them for village works, while the balance 20 per cent is spent by the district rural development agency (DRDA). In the earlier two schemes, the entire funds were utilised by the DRDA, with nothing going directly to the gaon sabhas.

The primary objective of the JRY is to generate employment through manual labour and the secondary objective is to create durable community assets in the process of employment generation. According to official statistics, 3,330 million mandays under JRY were generated in the country from 1989-90 to 1993-94.

In the last six months or so, there has been a clear shift in government of India's JRY strategy. Till late 1993, the JRY was being operated uniformly all over the country without specifically focusing on the backward districts in the states. A policy shift occurred in the second half of 1993, when it was decided to consciously concentrate JRY resources in the relatively more backward districts of the country. Two significant changes were made in this regard. The first was the change in criteria for allocation of funds to districts. Formerly, the districtwise allocation was made using an index of backwardness formulated on three criteria: (1) the percentage of agricultural labourers to main rural workers; (2) the percentage of rural SC/ST population to total rural population; and (3) the inverse of agricultural productivity, in the ratio of 20:60:20 respectively. In November 1993, the central government changed this norm to include only two parameters, viz, proportion of rural SC/ST population in a district to total SC/ST population in the state and (2) inverse of the district's agricultural productivity, in the ratio of 50:50 respectively. The main implications of this change in criteria for allocation of funds are: (1) districts with low agricultural productivity now get higher JRY allocations; (2) weightage for SC/ST population has been decreased from 60 per cent to 50 per cent; and (3) no more weightage is given for percentage of agricultural labourers in a district.

In some cases, the increase as well as decrease in funds as a result of this change in criteria have been dramatic. For example, in the hills of Uttar Pradesh where agricultural productivity is low, a district like Uttarkashi has seen its annual JRY outlay go up dramatically from Rs 3 crore to Rs 11 crore due to the change in formula. On the other hand, a district with high agricultural productivity, like Meerut in western UP, has suffered a drastic cut in outlay from Rs 12 crore to Rs 6 crore. In other words, the relatively less developed districts get higher JRY outlays and the developed districts get lower outlays.

New Subschemes

The second major policy shift was the starting of three new subschemes under the JRY ambit, specifically targeted at the more backward districts in the country. The first of these was the Employment Assurance Scheme (EAS) announced by the prime minister in his independence day speech on August 15, 1993. Broadly based on the Maharashtra Employment Guarantee Scheme, the EAS seeks to provide 100 days of employment during the lean agricultural season to all those who desire it. In keeping with the shift in JRY policy to focus on the more backward areas, the EAS coverage is restricted to Drought Prone Area Programme (DPAP) classified development blocks. At present, with the recent inclusion of 23 blocks in Jammu and Kashmir, the total number of EAS blocks in the country is 1,778, covering 23 states and four union territories. The central government budgetary outlay for EAS in 1994-95 is Rs 1,200 crore. Along with the states' share of Rs 300 crore, the total EAS outlay for the 1,778 blocks is Rs 1,500 crore, averaging about Rs 85 lakh a block.

Another subscheme of JRY is the intensified JRY (IJRY) programme. Here again, the focus is only on backward districts countrywide. One of the factors for selection of these 120 IJRY backward districts in 10 states was whether more than 50 per cent of the blocks in the district were under DPAP. High SC/ST percentage and low agricultural productivity were also criteria for determining backwardness under the IJRY. Apart from this, districts which were commercially and industrially advanced were also excluded from the purview of this scheme. The central outlay for IJRY in 1994-95 is Rs 700 crore. Along with the states' share of Rs 175 crore, the total IJRY outlay for the 120 districts is Rs 875 crore, an average of Rs 7.3 crore per district.

The third subscheme of JRY introduced in late 1993 was the JRY 'umbrella' scheme aimed at special and innovative projects aimed at specific problems faced in districts, such as prevention of migration of labour, enhancing women's employment, etc. These district specific projects are approved by ministry of rural development, and it is understood that a central budget of about Rs 100 crore is earmarked for this scheme in 1994-95.

All the above three new programmes are basically subschemes of JRY and operate under the same broad guidelines along with the 80:20 centre-state fund sharing pattern. The total central outlay on JRY and its three allied schemes in 1994-95 is a whopping Rs 5,055 crore, an increase of 45 per cent over the 1993-94 allocation of Rs 3,806 crore.

The main JRY subscheme with the most funds is the EAS, under which huge funds are being pumped into each DPAP block. The DPAP classification however could lead

to some minor imbalances in the field. While conceptually it is sound to pick DPAP blocks for the EAS, it is possible that some of the EAS blocks are not actually drought-prone any more. There are instances, for example, where blocks declared as DPAP blocks over 10 years ago, today may no longer merit classification as DPAP blocks, since they no longer fulfil the requisite criteria. In Bahraich district of UP, for example, which has 14 blocks under EAS, seven blocks have waterlogging problems and today should *prima facie* not be classified as drought-prone blocks. It is also eminently possible that some districts have become drought-prone subsequent to the DPAP classification over 10 years ago. It is necessary therefore to conduct a fresh survey to redetermine DPAP blocks countrywide, so that the truly drought-prone districts are benefited under this scheme. Another point which needs to be examined is whether a district with all its blocks covered under the EAS needs to also be classified as an IJRY district. In UP, for example, out of the 20 EAS districts there are four districts with all blocks under EAS, who are also under the IJRY. Instead of receiving huge funds under two JRY subschemes, perhaps other non EAS backward districts could also be considered under the IJRY.

The main problem facing the selected backward districts is in utilising the huge influx of funds coming in under the different JRY subschemes. In the 23 districts of UP covered under either the EAS or IJRY or both, the total availability of funds under the JRY and allied schemes in 1994-95 is expected to be Rs 608 crore, as compared to only Rs 300 crore under the regular JRY in 1993-94, an increase of over 100 per cent. In a district like Almora in the Kumaon hills of UP, the funds expected to be available under JRY, EAS and IJRY in 1994-95 are Rs 45 crore, compared to an availability of only Rs 14 crore under JRY in 1993-94, a three-fold increase. Apart from the fact that Almora may not have the requisite workforce to avail of the employment opportunities generated by Rs 45 crore worth of works, it does not even have the necessary infrastructure such as technical manpower or existing support systems like DRDA, to optimally utilise Rs 45 crore in one year. Hence along with pumping in of funds, strengthening of the existing delivery system in rural areas is necessary.

The ministry of rural development has repeatedly stressed the above point to the state governments and urged them to strengthen their existing infrastructure in the backward districts.

Perhaps the most pressing problem is that of an acute shortage of technical manpower at both district as well as block levels for technical scrutiny, execution and supervision of works under JRY and its subschemes. In most states, each development block has at most two junior engineers to prepare estimates, execute and supervise JRY works (Andhra Pradesh is one exception where each block equivalent has 10 to 12 junior engineers). If a district with 12 blocks has Rs 30 crore to utilise, this works out to a blockwise average utilisation of Rs 2.5 crore. In most state public works departments, an entire division headed by an executive engineer is stationed for executing works worth Rs 2 crore. It stands to reason therefore that for rural works under JRY, especially in backward districts, strengthening of the existing technical manpower base is essential.

Apart from suitably increasing the number of technical personnel at both district and block levels, there is also an urgent need to upgrade existing technical skills and capabilities in the context of the massive influx of funds under JRY. Certain specialised technical inputs are also necessary to execute special works such as watershed based schemes, especially since the government of India has directed that 50 per cent of EAS funds should be spent on watershed based development works. Logically this is correct, since the EAS is being run in drought-prone blocks, but in most states the existing technical personnel are untrained in executing watershed and micro watershed development works. Training and upgrading of skills in this context is therefore crucial. From the management point of view also, upgradation of skills and building of systems in the DRDAs is vital for effective planning, implementation and monitoring of works under the various JRY subschemes.

Another crucial aspect of the EAS is the part payment of wages in the form of foodgrain, wherever the open market price is higher than that of the revamped public distribution system (RPDS) price. Since in most EAS blocks the market price is well above the RPDS price, part payment of wages in foodgrain is a necessity. The implementation of this part cash and part foodgrain payment is leading to major problems in states where the public distribution system is intrinsically weak. Here the sheer logistics of ensuring that the foodgrain earmarked for the EAS actually reaches the beneficiary is more often than not beyond the scope of the existing delivery system. The experience is that in certain cases only the cash wage component is made on the spot and the foodgrain component usually paid much later.

Despite the above teething problems and constraints, the new JRY approach of concentrating more resources in backward districts is conceptually sound since it should lead to more balanced development in rural areas. The basic point, however, still remains that the influx of such massive funds to backward areas alone is not sufficient without simultaneously creating the infrastructure to optimally utilise these resources. It is also important for district authorities and the DRDAs to be wary of vested interests attempting to distribute these funds within the district on political lines. All in all, the pumping of JRY funds into backward districts is a unique opportunity to tackle both unemployment as well as underdevelopment in the relatively backward rural areas. To ensure that this opportunity is utilised optimally, much closer attention needs to be paid to shore up the supporting delivery system.

Rethinking Post-Cold War

Zaki Laidi

The speed at which post-cold war representations change and sink into confusion leaves one perplexed. That is why it is proper henceforth to speak not just of a post-cold war but of several such wars.

THE euphoria that followed the fall of the Berlin wall gave rise to the hope that the international system was at last ripe for a complete overhaul: the time had come to change its organisational principles and ground rules. The assumption was that everything could be explained in terms of the cold-war; it stood to reason then that once it came to an end everything would get resolved automatically. As soon as 'market democracy' was established as the undisputed norm, the hurdles associated with economic interdependence, cultural interpenetration, the globalisation of trade and environmental hazards would vanish of their own accord. Ideological quarrels hindered international co-operation, so it was felt that when these came to an end, it would receive a natural boost. This then was how the post-cold war brave new world was conceived; deideologisation and globalisation would mutually reinforce each other, heralding in a world government which, through the UN, would manage the common fund of mankind.

This Kantian vision, liberally sprinkled with references to the enlightenment, has had unfortunately to contend with international realities that stubbornly refuse to fit into any teleological scheme. For want of a new international order, what we have today is a loose international system whose distinctive feature is not 'disorder', a necessarily relative and mainly descriptive term, but the growing tension between the dynamics of power which under economic pressure are pushing towards globalisation and integration, and the problematic of meaning which, ever since it lost its teleological base, appears to be progressively divisible, flaky and transient. The divergence between meaning and power finds its strongest and most visible expression in the contrast between the rapid globalisation of markets and the rise of an ethnic, cultural or regional sense of identity. 'The end of geography' coincides with the revitalisation of micro-histories. However, interpreting this divergence is not as easy as it appears at first sight. Indeed, while the phenomenon of withdrawing into one's identity (infinitely small) may be seen as a reaction to globalisation (infinitely big), it becomes clear that in practice this apparent symmetry leads us nowhere. Certainly, the perception of living in a larger world creates a certain amount of insecurity. But in many case, it is not so much globalisation *per se* which induces such phenomena as the collapse of politics understood in the sense of a collective project or the inadequacy of the territoriallised nation-state. The assertion of one's identity or distinctiveness is not so much the result of globalisation as a break with the teleological and universalist representations of history. Furthermore, all revivalist movements have not hesitated to draw upon the resources of globalisation to advance their claims, be it the television, international financial networks, activation of the diaspora and actively participating in the trade market (drug and precious stone trafficking, to cite the most well known examples). Accordingly, as the most regressive or backward-looking movements have in a certain manner incorporated globalisation in their strategies, it appears difficult to attach any heuristic value to the 'return to the past' argument. This even more so because the 'return of nationalism' thesis presents one major flaw: what does the return to nationalism mean in central Asia, where the Muslim republics of the former Soviet Union are purely the products of Stalinism and where a Tadjik, Uzbek or Khirgiz national idea simply did not exist before the creation of the USSR. What is significant about the return to nationalism theme is that it is the starting point of the reinvention of the past, rather than the consecration of a process that got frozen on account of the cold war. In other words, nationalism is not spontaneous nor does it make complete sense. On the contrary, a meaning has to be given to it, it has to be rooted in a nonexistent framework. This all the more so as even in cases where nationalism did pre-exist historically (the Baltic states), the expectations are so out of consonance with the day to day reality that the so-called meaning discovered has necessarily to be called into question.

What does the idea of a return to nationalism mean in Russia where the nation has always been associated with the empire, and where, today, the forfeiture of the empire constitutes a unique historical phenomenon. One might as well say that in this case as in others, the selective utilisation of a stock of historical references has generally proved to be insufficient if not inoperative in 'reconstructing meaning'. It is even more ineffective in linking this quest for meaning with the exercise of power to the extent that in the former USSR like in ex-Czechoslovakia, the phenomena of political scissiparity go against the rationale of economic complementarity which Sovietism organised but did not invent fully. It may be added here that the hypothesis of a return to nationalism is weakened by the extremely heterogeneous nature of the situations it claims to describe. Tatar, Yakut or Siberian 'nationalism' is nothing more than the instrumentalisation of nationalism by a political elite exercising its authority over a territory rich in natural resources and which, in the context of the social and political dereliction that characterises the Russian Federation, has no desire to share it in any way with a larger whole that no longer makes any sense and produces even less power. In these circumstances, it is obvious that the 'end of history' versus the 'return of history' debate is a nonissue as both these processes are complementary. We can however well and truly speak of the end of history, not in the sense of the culmination of a process of transformation in the evolution of human societies, but in the sense of a finalised and teleological promise (Hegel's *Endzweck*) held out by one or several states—a journey with a starting point and an end point, a trajectory between what Kosselek called the field of experience and the horizon of expectations. Today, any conceptualisation of the post-cold war means dwelling on the implications of the "end of a historical cycle that began with the French revolution", as Francois Furet has so rightly emphasised. Symmetrically, we may speak of a return to history, that is to say, a return to the theme of roots. But apart from the fact, as we have seen, that it is extremely difficult to go back in time and link this return to the most elementary constraints of the present, there is the fundamental question of how this return is to be dated: a return to history, but to which history? To begin with, the spontaneous tendency is to situate it in the period preceding the advent of communism. Now, in Russia, in the Balkans and in China too, 'freezing the image' at the pre-cold war period is somewhat arbitrary. In the case of the Balkans, one would have to go back to at least the Treaty of Versailles; in the Russian case still further back to the 15th century at the time when Russia—then the grand duchy of Muscovy—was without an empire. All this amply proves that the 'reconstruction of meaning' and its linking up with the exercise of power cannot be settled through any ideological or teleological deintoxication which the proponents of Popper's 'open society' seem to be advocating at times.

For all that, the divergence between meaning and power cannot be reduced to the tension between the integrating logic of the economy and the disintegrating dynamic of identity. It triggers off a 'chain' reaction affecting all the factors related to the exercise of political sovereignty of nations, the most important of which being the military instrument. For the entire period of the cold

war, the connection between *military power* and *military policy* (meaning) did not pose any major problem. In the western camp, absolute priority was given to *containment* of Soviet forces particularly through nuclear deterrence, even if the doctrines regarding the use of nuclear arms varied from one player to another (United States, France) or displayed significant shifts (the complete and exclusive sanctification of French territory was in practice given up even before the end of the cold war).

In the Soviet camp, the Warsaw pact mechanism was on the other hand resolutely offensive. Today, the perception of a radical change in the balance of power in Europe has less to do with strictly military considerations (Russia remains by far the leading military power of Europe) as with the way we perceive danger. In other words, the way we view the collapse of Russian power is governed less by its inherent weaknesses than by the fact that today there is no underlying plan to this power. Which leads us to the commonplace but nonetheless essential observation: a military power, no matter how large, suffers a considerable loss of meaning the moment it is unable to connect power with a military policy. The divergence between military power and military policy affects not just Russia, but symmetrically, all its former western adversaries.

The military power-policy connection raises two sets of problems for all the inheritors of the cold war.

The first is related to the relationship between defence and security. During the cold war, the two terms corresponded almost naturally. With the end of the cold war, the dissociation of the two terms became more apparent. This because on the one hand security is being perceived in increasingly general terms and includes within its ambit technologies and information. Secondly, and more importantly, security problems are no longer systematically linked and identified with any politico-military player. Today, there is probably a greater feeling of *insecurity* in Europe than during the cold war despite the fact that the military threat has never been weaker. In other words, the military responses (defence policy) to insecurity appear to be both inadequate and tentative. Defence policies are no longer adequate when it comes to formulating security policies.

The second set of problems relates to the dissociation between defence and nation. During the cold war, defence was exclusively national. The rationale of alliances made no difference to this overriding reality. Today, one may well ask whether this equivalence has not been called into question. The widening of perspective in the European case is the result of at least three factors: the absolute necessity to share the cost of military research programmes, the quest for collective supra-national identities—weakened by the absence of a collective military instrument—and the fact that national solutions are unrealistic in a context where threats arise more from political contagion (the political disintegration of the east is spilling across the west) than from a clash of state wills. It is this last change which is the most difficult to conceptualise and organise.

Post-Cold Wars

While the divergence between meaning and power appears to be durable, it is still not possible, on the basis of this conceptual hypothesis, to construct a stable architecture of the international system. On the contrary, the latter lends itself to increasingly fluid and elusive interpretations; to pretend otherwise would be futile. Still, the speed at which our post-cold war representations change and sink into confusion leaves one perplexed. That is why we would do well henceforth to speak not just of a post-cold war but of *several* such wars. The recourse to chronology, though necessarily arbitrary, proves to be very instructive here.

The first post-cold war began with the fall of the Berlin wall and ended with the beginning of the Gulf crisis. This was a euphoric period when Kantian and Hegelian propositions of lasting peace and the triumph of reason were sprouted out liberally. In retrospect, we may smile at such an evaluation. But it would be wrong to reduce it to a simple expression of naivety. The end of the cold war was indeed an exceptional moment. It was for the first time, in the history of the modern international system,

that one began talking of a new international order, of a new global deal, without the preceding one (the cold war) having resulted in a military clash between the dominant powers of the international system. It was above all the time when one thought that the liquidation of the cold war would represent *a moment manageable in time and space*. The cold war was viewed as a bad memory that had to be forgotten and the process of its mental evacuation was facilitated by the widespread failure of communism. The west, like the elite in the east, tended to interpret the end of the cold war as a 'purge', a kind of *reverse normalisation*.

The fact that the civil societies of the east showed themselves to be utterly incapable of advancing any new ideas themselves to be utterly incapable of advancing any new ideas on the organisation of the post-cold war, that the dissidence in the east had been more social (Poland), more moral (Czechoslovakia) than political, that the transition to the market had never been envisaged by the east European or Soviet dissidence, was interpreted to a greater or lesser degree not as a structural handicap but rather as short-circuit towards 'market democracy'. Even if all this was not provided a theoretical framework, the guiding spirit of the first post-cold war was a great liberal voluntarism, based on the idea that the rejection of communism and the political vacuity in the east—reflected by an infantile idealisation of the west—were the best assets of market democracy. Manageable in time, the post-cold war appeared just as manageable in space. One was lulled to believe and hope that there existed an *optimum level of political disintegration* in the east; this was not likely to damage the territorial structure of the cold war (excluding East Germany and the Baltic countries), and better still, would remain confined to east Europe. During and after the cold war, the US never wished the political and territorial destruction of the USSR. *Dismantling the cold war, nothing but the cold war*, this was to have been the reasonable agenda of the new world order.

With the beginning of the Gulf crisis in August 1990, the international system entered the second post-cold war. The effect of this crisis was to amplify and extend to the south the vision of a major and rapid restructuring of the world on new principles. Western euphoria was heightened, as this crisis prefigured the political disappearance of the USSR. There was neither any ideological alternative left—something one knew since the fall of the Berlin wall—nor any strategic alternative, a fact that the southern countries—or nearly all of them—discovered to their great dismay. This period was to see flourish the idea of a 'new world order' based on the triumph of international law and reason. In truth, it was less a question of building a new world order than framing the rules of a *new public order* founded on a new and optimal connection between principles and means in the east as in the south.

As far as means are concerned, the Gulf war saw the principle of coalition take root, combining the advantages of political consensus and leadership exercised by a dominant player.

At the level of principles, the war, through resolution 688, consecrated the principle of interference, even if in practice, the 'founding text of interference' contained any number of ambiguities. This second 'moment' consecrated superficially at the international level—and not just in the east—the idea of a manageable, decipherable and qualitatively superior post-cold war.

The Moscow putsch, followed by the collapse of the USSR in December 1991, a year after the start of the Gulf crisis, was to put paid to this post-cold war representation. In this phase, two new realities emerged which erased completely the previous euphoric perceptions.

The first consequence of the splintering of the USSR was to demonstrate that the principle of *reverse normalisation* was no longer acceptable. Decomposition was not going to stop at the doors of the cold war but was going to bring down the entire pre-cold war edifice. Indeed, decommunisation has lead not only to the disappearance of the GDR and the Soviet Union but has also caused the breaking up of the Czechoslovak federation, the disintegration of Yugoslavia, the extension of ethnic cleansing to all the east European or former Soviet states which had in their midst non-national minorities, and the exacerbation of the question of identity within the Federation of Russia itself. In other words, not only did the disintegration rationale not stop where one hoped or expected it would, but there seems to be no way to stem the tide.

The second consequence, even more worrying than the first, was the realisation that political disintegration was not going to remain restricted to the former socialist countries but was bound to spread to the west where regional movements with separatist overtones are gaining ground in Belgium, Italy and Canada.

Indeed, the end of the cold war was largely responsible for the breaking up of Belgium because of the interplay of two factors: the abolition of the draft which limits 'interethnic' mixing between the Flemish and the Walloons and the demonstration effect that the amicable split of Czechoslovakia had on this country. To this one may add a third factor which flows to a large extent from the devalorisation of the socialist idea, that is to say the legitimacy of a redistribution of wealth between regions of very different levels of growth (Wallonia/Flemish country). The imperative, within the same nation, of 'paying for the others' just because 'the others' do not speak the same language or share the same history does not hold any more. The 'politically thinkable' post-cold war field is trying to shake itself free from territorial (national) and social (sharing) constraints, and this goes far beyond the Belgian case. The measure of this problem is of fundamental importance for the post-cold war and post-Maastricht Europe. Indeed, one of the aims of the European Union treaty is to respond to the dual challenge of the territoriality crisis and redistribution out of a kind of suprastate voluntarism. At the economic and monetary level, national space has been done away with to some extent (single market, Central European bank) or deemed to be of little relevance. At the social level, the Europe of Maastricht proposes to reinforce the redistribution of wealth from the rich countries to the poor countries. Now, it is this two-pronged attack that is causing problems, for it has to contend with the residual sovereignty of states as well as increasing public intolerance of redistributive and *a fortiori* supranational policies. The few cases discussed above show that we have yet to gauge the full impact of the collapse of communism. Conceptualising the post-cold war is by no means an easy task.

[This article, first published in French, is the introduction to a collection of articles by Zaki Laidi, *L'Ordre Mondial relache Sens et puissance apres la guerre froide*, Presses de la Fondation Nationale des Sciences Politiques, Paris, 1993. An English version of the entire book will soon be published by Berg Publishers (USA)—Author.]

Cultural Imperialism in Late 20th Century

James Petras

Cultural liberation involves not merely empowering individuals or classes, but is dependent on the development of a socio-political force capable of confronting the state terror that precedes cultural conquest. Most importantly, the Left must recreate a faith and a vision of a new society built around spiritual as well as material values.

US CULTURAL imperialism has two major goals—one economic and the other political—to capture markets for its cultural commodities and to establish hegemony by shaping popular consciousness. The export of entertainment commodities is one of the most important sources of capital accumulation and global profits displacing manufacturing exports. In the political sphere, cultural imperialism plays a major role in dissociating people from their cultural roots and traditions of solidarity, replacing them with media created 'needs', which change with every publicity campaign. The political effect is to alienate people from traditional class and community bonds, atomising and separating individuals from each other.

Cultural imperialism emphasises the segmentation of the working class: stable workers are encouraged to dissociate themselves from temporary workers, who in turn separate themselves from the unemployed, who are further segmented among themselves within the 'underground economy'. Cultural imperialism encourages working people to think of themselves as part of a hierarchy emphasising minute differences in life style, in race and gender, with those below them rather than the vast inequalities that separate them from those above.

The principle target of cultural imperialism is the political and economic exploitation of youth. Imperial entertainment and advertisements target young people who are most vulnerable to US commercial propaganda. The message is simple and direct: 'modernity' is associated with consuming US media products. Youth represent a major market for US cultural exports and they are most susceptible to the consumerist-individualist propaganda. The mass media manipulates adolescent rebelliousness by appropriating the language of the left and channelling discontent into consumer extravagances.

Cultural imperialism focuses on youth not only as market but also for political reasons: to undercut a political threat in which personal rebellion could become political revolt against economic as well as cultural forms of control.

Over the past decade progressive movements confront a paradox: while the great majority of the people in the third world experience deteriorating living standards, growing social and personal insecurity and decay in public services (while affluent minorities prosper as never before) the subjective response to these conditions has been sporadic revolts, sustained, but local activities and large-scale protests of short duration. In a word, there is a profound gap between the growing inequalities and socio-economic conditions on the one hand and the weaknesses of revolutionary or radical subjective responses. The maturing 'objective conditions' in the third world have not been accompanied by the growth of subjective forces capable of transforming the state or society. It is clear that there is no 'automatic' relationship between socio-economic regression and socio-political transformation. Cultural intervention (in the broadest sense including ideology, consciousness, social action) is the crucial link converting objective conditions into conscious political intervention. Paradoxically, imperial policy-makers seem to have understood the importance of cultural dimensions of political practice far better than their adversaries.

Cultural Domination

Imperialism cannot be understood merely as an economic-military system of control and exploitation. Cultural domination is an integral dimension to any sustained system of global exploitation.

In relation to the third world, cultural imperialism can be defined as the systematic penetration and domination of the cultural life of the popular classes by the ruling class of the west in order to reorder the values, behaviour, institutions and identity of the oppressed peoples to conform with the interests of the imperial classes. Cultural imperialism has taken both 'traditional' and modern forms. In past centuries, the church, educational system, and public authorities played a major role in inculcating native peoples with ideas of submission and loyalty in the name of divine or absolutist principles. While these 'traditional' mechanisms of cultural imperialism still operate, new modern instrumentalities rooted in contemporary institutions have become increasingly central to imperial domination. The mass media, publicity, advertisement and secular entertainers and intellectuals play a major role today. In the contemporary world, Hollywood, CNN and Disneyland are more influential than the Vatican, the Bible or the public relations rhetoric of political figures.

Cultural penetration is closely linked to politico-military domination and economic exploitation. US military interventions in support of the genocidal regimes in central America which protect its economic interests are accompanied by intense cultural penetration. US-financed evangelicals invade Indian villages to inculcate messages of submission among the peasant-Indian victims. International conferences are sponsored for domesticated intellectuals to discuss 'democracy and market'. Escapist television programmes sow illusions from 'another world'. Cultural penetration is the extension of counter-insurgency warfare by non-military means.

Contemporary cultural colonialism (CCC) is distinct from past practices in several senses: (1) It is oriented toward capturing mass audiences, not just converting elites. (2) The mass media, particularly television, invade the household and function from the 'inside' and 'below' as well as from 'outside' and above. (3) CCC is global in scope and homogenising in its impact: the pretence of universalism serves to mystify the symbols, goals and interests of the imperial power. (4) The mass media as instruments of cultural imperialism today are 'private' only in the formal sense: the absence of formal state ties provides a legitimate cover for the private media projecting imperial state interests as 'news' or 'entertainment'. (5) Under contemporary imperialism, political interests are projected through non-imperial subjects. 'News reports' focus on the personal biographies of mercenary peasant-soldiers in central America and smiling working class US blacks in the Gulf war.[1] (6) Because of the increasing gap between the *promise* of peace and prosperity under unregulated capital and the reality of increasing misery and violence, the mass media have narrowed even further the possibilities of alternative perspectives in their programmes. Total cultural control is the counterpart of the total separation between the brutality of real-existing capitalism and the illusory promises of the free market. (7) To paralyse collective responses, cultural colonialism seeks to destroy national identities or empty them of substantive socio-economic content. To rupture the solidarity of communities, cultural

imperialism promotes the cult of 'modernity' as conformity with external symbols. In the name of 'individuality', social bonds are attacked and personalities are reshaped according to the dictates of media messages. While imperial arms disarticulate civil society, and banks pillage the economy, the imperial media provide individuals with escapist identities.

Cultural imperialism provides devastating demonological caricatures of revolutionary adversaries, while encouraging collective amnesia of the massive violence of pro-western countries. The western mass media never remind their audience of the murder by anti-communist pro-US regimes of 1,00,000 Indians in Guatemala, 75,000 working people in El Salvador, 50,000 victims in Nicaragua. The mass media cover up the great disasters resulting from the introduction of the market in eastern Europe and the ex-USSR, leaving hundreds of millions impoverished.

Propaganda and Capital Accumulation

The mass media is one of the principal sources of wealth and power for US capital as it extends its communication networks throughout the world. An increasing percentage of the richest North Americans derive their wealth from the mass media. Among the 400 wealthiest Americans the percentage deriving their wealth from the mass media increased from 9.5 per cent in 1982 to 18 per cent in 1989. Today almost one out of five of the richest North Americans derive their wealth from the mass media. Cultural capitalism has displaced manufacturing as a source of wealth and influence in the US.

The mass media have become an integral part of the US system of global political and social control, as well as a major source of super profits. As the levels of exploitation, inequality and poverty increase in the third world, western-controlled mass communications operate to convert a critical public into a passive mass. Western media celebrities and mass entertainment have become important ingredients in deflecting potential political unrest. The Reagan presidency highlighted the centrality of media manipulation through highly visible but politically reactionary entertainers, a phenomena which has spread to Latin America and Asia.

There is a direct relation between the increase in the number of television sets in Latin America, the decline of income and the decrease in mass struggle. In Latin America between 1980 and 1990, the number of television sets per inhabitant increased 40 per cent, while the real average income declined 40 per cent, and a host of neo-liberal political candidates heavily dependent on television images won the presidency.

The increasing penetration of the mass media among the poor, the growing investments and profits by US corporations in the sale of cultural commodities and the saturation of mass audiences with messages that provide the poor with vicarious experiences of individual consumption and adventure defines the current challenge of cultural colonialism.

US media messages are alienating the third world people in a double sense. They create illusions of 'international' and 'cross class' bonds. Through television images a false intimacy and an imaginary link is established between the successful subjects of the media and the impoverished spectators in the 'barrios'. These linkages provide a channel through which the discourse of individual solutions for private problems is propagated. The message is clear. The victims are blamed for their own poverty, success depends on individual efforts. Major TV satellites, US and European mass media outlets in Latin America avoid any critique of the politico-economic origins and consequences of the new cultural imperialism that has temporarily disoriented and immobilised millions of impoverished Latin Americans.

Politics of Language

Cultural imperialism has developed a dual strategy to counter the Left and establish hegemony. On the one hand, it seeks to corrupt the political language of the Left; on the other it acts to desensitise the general public to the atrocities committed by western powers. During the 1980s the western mass media systematically appropriated basic ideas of the left, emptied them of their original content and refilled them with a reactionary message. For example, the mass media described politicians intent in restoring capitalism and stimulating inequalities as 'reformers' or 'revolutionaries', while their opponents were labelled 'conservatives'. Cultural imperialism sought to promote ideological confusion and political disorientation by reversing the meaning of political language. Many progressive individuals became disoriented by this ideological manipulation. As a result, they were vulnerable to the claims of imperial ideologues who argue that the terms 'Right' and 'Left' lacked any meaning, that the distinctions have lost significance, that ideologies no longer have meaning. By corrupting the language of the Left and distorting the content of the Left and Right, cultural imperialists hope to undermine the political appeals and political practices of the anti-imperialist movements.

The second strategy of cultural imperialism was to de-sensitise the public; to make mass murder by the western states routine, acceptable activities. Mass bombings in Iraq were presented in the form of video games. By trivialising crimes against humanity, the public is desensitised from its traditional belief that human suffering is wrong. By emphasising the modernity of new techniques of warfare, the mass media glorify existing elite power—the techno-warfare of the west. Cultural imperialism today includes 'news' reports in which the weapons of mass destruction are presented with human attributes while the victims in the third world are faceless 'aggressors-terrorists'.

Global cultural manipulation is sustained by the corruption of the language of politics. In eastern Europe, speculators and mafioso seizing land, enterprises and wealth are described as 'reformers'. Contrabandists are described as 'innovating entrepreneurs'. In the west the concentration of absolute power to hire and fire in the hands of management and the increased vulnerability and insecurity of labour is called 'labour flexibility'. In the third world the selling of national public enterprise to giant multinational monopolies is described as 'breaking-up monopolies'. 'Reconversion' is the euphemism for reversion to 19th century condition of labour stripped of all social benefits. 'Restructuring' is the return to specialisation in raw materials or the transfer of income from production to speculation. 'Deregulation' is the shift in power to regulate the economy from the national welfare state to the international banking, multinational power elite. 'Structural adjustments' in Latin America mean transferring resources to investors and lowering payments to labour. The concepts of the left (reform, agrarian reform, structural changes) were originally oriented toward redistributing income. These concepts have been co-opted and turned into symbols for reconcentrating wealth, income and power into the hands of western elites. And of course all the private cultural institutions of imperialism amplify and propagate this Orwellian disinformation. Contemporary cultural imperialism has debased the language of liberation, converting it into symbols of reaction.

Cultural Terrorism

Just as western state terrorism attempts to destroy social movements,[3] revolutionary governments' and disarticulate civil society,[4] economic terrorism as practised by the IMF and private bank consortia destroy local industries, erode public ownership and savages wage and salaried household. Cultural terrorism is responsible for the physical displacement of local cultural activities and artists. Cultural terrorism by preying on the psychological weaknesses and deep anxieties of vulnerable third world peoples, particularly their sense of being 'backward', 'traditional' and oppressed, projects new images of 'mobility' and 'free expression', destroying old bonds to family and community, while fastening new chains of arbitrary authority linked to corporate power and commercial markets. The attacks on traditional restraints and obligations is a mechanism by which the capitalist market and state becomes the ultimate centre of exclusive power.

Cultural imperialism in the name of 'self expression' tyrannises third world people fearful of being labelled 'traditional', seducing and manipulating them by the phoney images of classless 'modernity'. Cultural imperialism questions all pre-existing relations that are obstacles to the one and only sacred modern deity: the market. Third world peoples are entertained, coerced, titillated to be 'modern', to submit to the demands of capitalist market to discard comfortable, traditional, loose fitting clothes for ill-fitting unsuitable tight blue jeans.

Cultural imperialism functions best through colonised intermediaries, cultural collaborators. The prototype imperial collaborators are the upwardly mobile third world professionals who imitate the style of their patrons. These collaborators are servile to the west and arrogant to their people, prototypical authoritarian personalities. Backed by the banks and multinationals, they wield immense power through the state and local mass media. Imitative of the west, they are rigid in their conformity to the rules of unequal competition, opening their country and peoples to savage exploitation in the name of free trade. Among the prominent cultural collaborators are the institutional intellectuals who deny class domination and imperial class warfare behind the jargon of objective social science. They fetishise the market as the absolute arbiter of good and evil. Behind the rhetoric of 'regional co-operation', the conformist intellectuals attack working class and national institutions which constrain capital movements—their supporters isolated and marginalised.

Today throughout the third world, western-funded third world intellectuals have embraced the ideology of 'concertacion' (class collaboration). The notion of interdependence has replaced imperialism. And the unregulated world market is presented as the only alternative for development. The irony is that today, as never before, the 'market' has been least favourable to the third world. Never have the US, Europe and Japan been so aggressive in exploiting the third world. The cultural alienation of the institutional intellectuals from the global realities is a by-product of the ascendancy of western cultural imperialism. For, those critical intellectuals who refuse to join the celebration of the market, who are outside of the official conference circuits, the challenge is to once again return to the class and anti-imperialist struggle.

One of the great deceptions of our times is the notion of 'internationalisation' of ideas, markets and movements. It has become fashionable to evoke terms like 'globalisation' or 'internationalisation' to justify attacks on any or all forms of solidarity, community, and/or social values. Under the guise of 'internationalism', Europe and the US have become dominant exporters of cultural forms most conducive to depoliticising and trivialising everyday existence. The images of individual mobility, the 'self-make persons', the emphasis on 'self-centred existence' (mass produced and distributed by the US mass media industry) now have become major instruments in dominating the third world.

Neo-liberalism continues to thrive not because it solves problems, but because it serves the interest of the wealthy and powerful and resonates among some sectors of the impoverished self-employed who crowd the streets of the third world. The North Americanisation of third world cultures takes place with the blessing and support of the national ruling classes because it contributes to stabilise their rule. The new cultural norms—the private over the public, the individual over social, the sensational and violent over everyday struggles and social realities—all contribute to inculcating precisely the egocentric values that undermine collective action. The culture of images, of transitory experiences, of sexual conquest, works against reflection, commitment and shared feelings of affection and solidarity. The North Americanisation of culture means focusing popular attention on celebrities, personalities and private gossip—not on social depth, economic substance and the human condition. Cultural imperialism distracts from power relation and erodes collective forms of social action.

The media culture that glorifies the 'provisional' reflects the rootlessness of the US capitalism—its power to hire and fire, to move capital without regard for communities. The myth of 'freedom of

mobility' reflects the incapacity of people to establish and consolidate community roots in the face of the shifting demands of capital. North American culture glorifies transient, impersonal relations as 'freedom' when in fact these conditions reflect the anomie and bureaucratic subordination of a mass of individuals to the power of corporate capital. North Americanisation involves a wholesale assault on traditions of solidarity in the name of modernity, attacks on class loyalties in the name of individualism, the debasement of democracy through massive media campaigns focusing on personalities.

The new cultural tyranny is rooted in the omnipresent repetitive singular discourse of the market, of a homogenised culture of consumption, of a debased electoral system. The new media tyranny stands alongside the hierarchical state and economic institutions that reach from the board rooms of the international banks to the villages in the Andes. The secret of the success of North American cultural penetration of the third world is its capacity to fashion fantasies to escape from misery, that the very system of economic and military domination generates. The essential ingredients of the new cultural imperialism is the fusion of commercialism-sexuality-conservatism each presented as idealised expressions of private needs, of individual self-realisation. To some third world people immersed in everyday dead end jobs, struggles for everyday survival, in the midst of squalor and degradation, the fantasies of North American media, like the evangelist, portray 'something better', a hope in a future better life—or at least the vicarious pleasure of watching others enjoying it.

If we want to understand the absence of revolutionary transformation, despite the maturing of revolutionary conditions, we must reconsider the profound psychological impact of state violence, political terror and the deep penetration of cultural/ideological values propagated by the imperial countries and internalised by the oppressed peoples. The state violence of the 1970s and early 1980s created long-term, large-scale psychic damage—fear of radical initiatives, distrust of collectivities, a sense of impotence before established authorities—even as the same authorities are hated. Terror turned 'people inward' toward private domains.

Subsequently, neo-liberal policies, a form of 'economic terrorism', resulted in the closing of factories, the abolition of legal protection of labour, the growth of temporary work, the multiplication of low paid individual enterprises. These policies further fragmented working class and urban communities. In this context of fragmentation, distrust and privatisation, the cultural message of imperialism found fertile fields to exploit vulnerable peoples' sensibilities, encouraging and deepening personal alienation, self-centred pursuits and individual competition over ever scarce resources.

Cultural imperialism and the values it promotes has played a major role in preventing exploited individuals from responding collectively to their deteriorating conditions. The symbols, images and ideologies that have spread to the third world are major obstacles to the conversion of class exploitation and growing immiseration into class conscious bases for collective action. The great victory of imperialism is not only the material profits, but its conquest of the inner space of consciousness of the oppressed directly through the mass media and indirectly through the capture (or surrender) of its intellectual and political class. Insofar as a revival of mass revolutionary politics is possible, it must begin with open warfare not only with the conditions of exploitation but with culture that subjects its victims.

Against the pressures of cultural colonialism is the reality principle: the personal experience of misery and exploitation imposed by western multinational banks, the police/military repression enforced by US supplied arms. Everyday realities which the escapist media can never change. Within the consciousness of the third world peoples there is a constant struggle between the demon of individual escape (cultivated by the mass media) and the intuitive knowledge that collective action and responsibility is the only practical response. In times of ascending social mobilisations, the virtue of solidarity takes precedence; in times of defeat and decline, the demons of individual rapacity are given licence.

There are absolute limits in the capacity of cultural imperialism to distract and mystify people beyond which popular rejection sets in. The TV 'table of plenty' contrasts with the experience of the empty kitchen; the amorous escapades of media personalities crash against a houseful of crawling, crying hungry children. In the street confrontations, Coca Cola becomes a molotov cocktail. The promise of affluence becomes an affront to those who are perpetually denied. Prolonged impoverishment and widespread decay erode the glamour and appeal of the fantasies of the mass media.

The false promises of cultural imperialism become the objects of bitter jokes relegated to another time and place. The appeals of cultural imperialism are limited by the enduring ties of collectivities—local and regional—which have their own values and practices. Where class, racial, gender and ethnic bonds endure and practices of collective action are strong, the influence of the mass media are limited or rejected.

To the extent that pre-existing cultures and traditions exist, they form a 'closed circle' which integrates social and cultural practices that look inward and downward, not upward and outward. In many communities there is a clear rejection of the 'modernist' developmental-individualist discourse associated with the supremacy of the market. The historical roots for sustained solidarity and anti-imperial movements are found in cohesive ethnic and occupational communities; mining towns, fishing and forestry villages, industrial concentrations in urban centres. Where work, community and class converge with collective cultural traditions and practices, cultural imperialism retreats.

The effectiveness of cultural imperialism does not depend merely on its technical skills of manipulation, but on the capacity for the state to brutalise and atomise the populace, to deprive it of its hopes and collective faith in egalitarian societies.

Cultural liberation involves not merely 'empowering' individuals or classes, but is dependent on the development of a socio-political force capable of confronting the state terror that precedes cultural conquest. Cultural autonomy depends on social power and social power is perceived by the ruling classes as a threat to economic and state power. Just as cultural struggle is rooted in values of autonomy, community and solidarity which are necessary to create the consciousness for social transformations, political and military power is necessary to sustain the cultural bases for class and national identities.

Most important, the Left must recreate a faith and vision of a new society built around spiritual as well as material values: values of beauty and not only work. Solidary linked to generosity and dignity. Where modes of production are subordinated to efforts to strengthen and deepen long-standing personal bonds and friendship.

Socialism must recognise the longings to be alone to be intimate as well as to be social and collective. Above all, the new vision must inspire people because it resonates with their desire not only to be free from domination but free to create a meaningful personal life informed by affective non-instrumental relations that transcend everyday work even as it inspires people to continue to struggle. Cultural imperialism thrives as much on novelty, transitory relations and personal manipulation, but never on a vision of authentic, intimate ties based on personal honesty, gender equality and social solidarity.

Notes

1 Personal images mask mass state killings, just as technocratic rhetoric rationalise weapons of mass destruction ('intelligent bombs'). Cultural imperialism in the era of 'democracy' must falsify reality in the imperial country to justify aggression—by converting victims into aggressors and aggressors into victims. Hence in Panama the US imperial state and mass media projected Panama as a drug threat to young people in the US, as it dropped bombs on working class communities in Panama.

2 The experiences of El Salvador and Guatemala in the 1980s is illustrative.

3 Nicaragua's Sandinista government in the 1980s and Chile under Allende in the 1970s are emblematic.

4 The case of Uruguay and Argentina in the 1970s and 1980s under the military regimes.

CREATING INDIA'S MULTINATIONALS

BRINGING RESPECT TO THE 'MADE IN INDIA' LABEL

Excerpts from the Speech of Shri K.L. Chugh, Chairman, I.T.C. Limited at the 83rd Annual General Meeting held on 20.7.1994

THE year 1993/94 has been another good year for your Company. **With Gross Turnover at Rs. 4280 crores, Net Profit at Rs. 206 crores and Foreign Exchange earnings at Rs. 822 crores, your Company continues to maintain its pace of rapid growth.**

There is a new-found confidence amongst Indian companies to compete with the best in the world and aspire to become India's multinationals. For the first time, there is palpable vitality in the Government-Industry dialogue, in a bid to think and work together to take India forward.

The signing of the GATT Declaration by member nations ushers in a new era where **freer world trade will become the engine of growth. The freer world trade regime, I believe, would provide India and Indian companies an opportunity to strategise for world-class positioning in those industries that have a natural or potential competitive advantage.**

THE NEED FOR COUNTRY STRATEGIES

Our experience of the last 45 years has convinced us that no single country can do everything well by itself. Factor advantages, innate skills and a number of other variables generate competitive advantage in specific areas. **Countries that are able to identify and focus on their areas of potential competitive advantage will emerge as winners.**

If India's per capita income was to catch up even in the next 25 years with Thailand's — one of Asia's relatively less developed economies — given Thailand's rate of growth of 7%, and the present rates of population growth, India's GDP needs to grow by an astounding 18% per annum for the next 25 years! Even assuming India's population growth is held at 1% instead of 2% per annum, to catch up with Thailand we need a growth rate of 15% year on year for the next 25 years!

The enormity of the task before us is evident. **There is therefore extreme urgency in strategising and evolving a national agenda aimed at quantum progress and a strong positioning of India in the new world economic order.**

We therefore need to make substantial progress on several fronts at a frenetic pace and at the same time. This is best achieved by opening up the economy to the world and inviting foreign companies to grow the economy by participating in the huge Indian consumer market. We also need to nurture Indian companies to grow and be able to compete globally, evolving into India's MNCs in the next few years.

ROLE OF FOREIGN MNCs

The large Indian consumer market, representing 1/5th of the world's population, together with its low cost of production are powerful forces attracting foreign MNCs into India. Foreign MNCs are today accessing the Indian market both through strategic alliances with Indian companies, who understand the Indian consumer better, as well as through direct 100% investment into India. **Foreign MNCs bring in technology and capital. They have immense capability of value addition in a very short span of time.**

With their capital, technology and brands foreign MNCs have a crucial role to play in India's economic growth, and are correctly being invited into India in the liberalised policy framework. Besides the direct technology and capital infusion, ancillary and small businesses will also benefit more rapidly with the entry of foreign companies, enhancing value addition to the Indian economy.

Foreign MNCs are initially attracted by the huge Indian consumer market. The low cost advantage that goes with this attraction will, in due course, make India a preferred production centre, and foreign companies will profitably export goods out of India thus invigorating the Indian economy and also bestowing international respect on India as a production centre for high quality goods.

THE NEED TO CREATE INDIA'S MNCs

However, India would stand stronger in the comity of nations if Indian companies can sell their products and trademarks abroad successfully in competition with world leaders. **While foreign investment into India does benefit the economy in considerable measure, even greater benefits would be achieved if we nurture and develop our own companies to grow into India's multinationals.** Even today, the names General Motors and Sony, for instance, evoke images of US and Japanese quality leadership. They are the flag-bearers and industrial ambassadors of their respective countries and give immense prestige to the 'Made in USA' and 'Made in Japan' labels. Other smaller companies in these countries have prospered more rapidly by riding on the goodwill and image of their multinationals, together contributing strongly to their national wealth. Similarly, Samsung, Hyundai and Daewoo have substantially elevated the South Korean image, accelerating the global spread of 'Made in Korea' products. India now needs similar flagbearers to generate international respect for the 'Made in India' label.

It is, therefore, essential to adopt a dual policy consisting of :

(i) attracting foreign multinationals, and (ii) creating India's multinationals.

Such a 'middle path' strategy will result in balancing the Indian economic power, in the next decade, with foreign multinationals on one side and a growing number of Indian multinationals on the other.

STRATEGIES TO CREATE INDIA'S MNCs

i) SELECT KEY BUSINESSES

It is essential first to identify areas where India possesses or is in a position to develop and sustain competitive advantage rapidly on a global scale. Such advantage should have the potential to be sustainable in a low tariff environment and compete with the best companies and products in the world. **India today has a competitive advantage in several areas such as textiles, agri-processing, software, jewellery crafting, leather, granite, tea, marine foods, engineering goods, two-wheelers, tobacco, speciality steel, aluminium, construction and speciality chemicals, to name a few.**

India is the lowest cost producer in a number of these areas. True export potential has been barely tapped. An increase of even 1% in only these areas would generate additional exports out of India of $ 5 billion, which would increase total exports by 25%. It is only in gems and jewellery that India has an appreciable share of 40% of world trade. Even here, our low cost advantage is not fully exploited. **We should strategise to export our skills overseas,** and instead of merely being suppliers to the Cartier's and the Tiffany's of this world, we should target the premium value-added end. **A country strategy needs to be put into motion urgently in all such areas where India has the potential to develop competitive advantage.**

For instance, only 12% of all tobacco users in India consume cigarettes. **Pragmatic taxation policies in the last two years have helped market growth in what was a declining segment of the industry two years ago.** The cigarette segment is now likely to grow by 5—6% this year. If the States had not vitiated the single point taxation format, the growth could be even more rapid, improving Government revenues and making Indian industry even more competitive globally.

We are today the lowest cost quality producers in the world, yet our share in the $ 250 billion global market is still negligible. A growing and modernising domestic base, I believe, can give India a very strong position in this business. Even a 1% share of the world market would mean a market size

This does not purport to be a report of the proceedings of the 83rd Annual General Meeting. For the full text of the speech, please write to : Corporate Public

of $ 2.5 billion which is twice the present size of the domestic market.

ii) ACQUIRE QUALITY AND COST LEADERSHIP

The next step would be to identify companies which could add quality and cost leadership and develop the capability to produce world-class quality products at a cost that is appreciably lower than the international cost. Such a capability would enable penetration into markets where there are barriers created by established brands.

Capturing consumer franchise is the key to success. Strong international consumer brands have behind them decades of investment in product development and image creation. Recent events, however, indicate a possible discontinuity where people are willing to make purchase decisions purely on product attributes, quality, cost and service. A sustained continuance of product, quality, cost and service might create space in the new era for new brands.

iii) LEADERSHIP IN THE INDIAN MARKET

The companies so identified should be in leadership positions in their product categories in the Indian market. Though India does have a large consumer market, disparate state-level taxation on almost all products serves to fragment the market to the detriment of large companies having national distribution of their products. It is indeed ironic that India has signed GATT but is still very far from having a common market in its own country! **An Indian common market is a MUST** for Indian companies to effectively capture synergies in the home market before attempting to position themselves on a global scale.

iv) BUILD MARKET PRESENCE OVERSEAS/ACQUIRE BRANDS AND COMPANIES

The one major impediment facing aspiring Indian MNCs would be their ability to penetrate the barriers created by international brands built through massive investment of long years. **The only answer lies in a bold and aggressive approach being adopted by potential Indian MNCs in acquiring companies/brands abroad.** None of our Indian companies have the financial resources to adopt this bold approach. Acquisition of brands or companies would only be possible with Government support, by the **establishment of either a Brand Acquisition Fund or a Venture Capital Fund.**

I advocate the acquisition route in preference to the greenfield route of launching our own Indian brands till a critical size is achieved, since the latter is a much more risky, expensive, and long-gestating strategy in a situation where we have little time.

Indian companies today are in no position to adopt and achieve global relevance by the year 2000 on their own, without accessing cost effective funds to finance company and brand acquisitions, purchase of technology and investment in product development and R&D. As a consequence, they need to be nurtured till they reach critical size.

NURTURING INDIA'S MULTINATIONALS

A scan of the top 50 Fortune Global 500 companies reveals that barring stray exceptions, most companies have emerged with a shareholding pattern that is widespread. MNCs have emerged with such a shareholding pattern after several decades and today have no worry about loss of control in mobilising substantial funds needed to achieve growth objectives. Indian companies are not yet in such an enviable position and loss of control is today a crucial issue in most leading Indian companies having growth aspirations. It is necessary, therefore, to bring well-positioned Indian companies having ambitions to reach global relevance, on a similar or equivalent platform and enable them to access funds both in the Indian and global markets in the same manner as most of the Fortune 500 companies do, without fear of possible loss of control.

The evolution of the German and Japanese global companies was, in major part, a result of their banks and financial institutions holding substantial equity stakes in such companies on a permanent basis.

A similar Golden Share concept needs to be brought in whereby financial institutions and banks hold a Golden Share – perhaps between 26% and 40% – of large Indian companies with multinational aspirations, to enable them to compete and grow, enriching India in the process, without worry about loss of control. I would, however, as one suggestion recommend a bold approach whereby the Government could encourage financial institutions to set up a Fund, which supports the Golden Share concept. The establishment of such a Fund would protect and help create Indian multinationals and would provide focussed support, releasing the power of the Indian entrepreneurs to commit themselves to bringing prestige to the 'Made in India' label around the world through competitive battles, hard work, commitment and professional excellence.

ITC – AN INDIAN MNC IN THE MAKING

Your Company has been pursuing growth through international competitiveness in all its spheres of operation. **It has built strong brand equity through appropriate positioning and consumer orientation.**

The recent past has seen investments in cigarette technology which have resulted in ITC emerging as one of the lowest cost quality producers in the world. The managerial resources of your Company, through training and development and exposure to international cultures, are today fully equipped to face international competition and spearhead the Company's foray into world markets. **The strong performance of your Company in generating Foreign Exchange earnings has enabled it to earn the prestigious status of 'Super Star Trading House'.**

ITC Global Holdings Pte Ltd., a wholly-owned subsidiary in Singapore, has built upon ITC's established strengths and linkages with the farming community and the consumer to source quality Indian agri-products for world markets. It is well on its way to become an Indian 'Sogososha' and a marketing spearhead for Indian products in world markets.

Your Company successfully raised low cost funds overseas, both in the equity and the debt markets. The immensely successful GDR issue last year was oversubscribed in excess of 9 times at the high price-earnings multiple of over 35 times. Besides, since April 1993, your Company has also successfully raised debt of US $ 45 million at internationally competitive rates of interest.

With appropriate strategies in place and a supportive Government policy framework, the ITC Group is positioning itself to become India's MNC by the turn of the century.

The past two decades have seen your Company transform itself into an industrial Group that is growing rapidly in all its businesses. In 1970, your Company's Turnover was barely Rs. 145 crores, with Net Profit of Rs. 3 crores. Your Company was then a single product Company in the business of Cigarettes and Tobacco. **Today, ITC is a diversified Group in the businesses of Hotels, Edible Oils, Paper and Packaging, Financial Services, Software and International Trading, besides Cigarettes and Tobacco, with a Group Turnover of almost Rs. 6000 crores and a Net Profit of close to Rs. 300 crores. In the past 24 years, ITC as a Group has grown by over 40 times in Turnover and 100 times in Profits.** Our Market Capitalisation was barely $10 million in 1970 at the then prevailing exchange rate. Today, the Market Capitalisation of the Group is almost $ 4 billion. The Market Value of the Group in the last 24 years has improved by over 300 times in dollar terms and by over 800 times in rupee terms.

Our Hon'ble Finance Minister, in his 1994 Budget Speech, has envisioned: "Looking ahead I have a vision of our industrial firms acquiring a global reach and their names becoming household words in far-off distant lands." **We, at ITC, have been at the forefront in prescribing the strategic necessity of creating India's multinationals,** which would compete with the best in the world and generate international respect for the 'Made in India' label. We are committed to becoming a prominent Indian flagbearer and industrial ambassador and one of India's MNCs by the year 2000.

I would like to conclude by reiterating that the time has now come for us to stand with determination and courage, and **collectively put our shoulders to the wheel to create not just a few, but several Indian multinationals by the year 2000.** These Indian multinationals would then serve to return India to the exalted position in the world it occupied centuries ago.

Population Policies: Some Issues

T N Krishnan

Population Policies Reconsidered: Health, Empowerment, and Rights edited by Gita Sen, Adrienne Germain, Lincoln C Chen; Harvard Series on Population and International Health, distributed by Harvard University Press, Cambridge, MA, USA, March 1994; pp XIV and 280; $ 14.95.

THIS is a serious, stimulating and thought-provoking collection of essays on population policies. The volume contains 17 essays and, apart from the overview, these are arranged under four sections. However, the essays fall short of actually proposing an alternative set of population policies. The essays cogently argue that population policy is not confined to 'condom' distribution alone but impinges on some profound questions on human values. The editors say that the challenge posed to current population policies is based on three sets of fundamental issues—ethics, human rights and human development; women's empowerment; and reproductive and sexual health. The editors have unequivocally stated their concerns in the overview chapter: "The first is that population policies should be transformed to reflect a fundamental commitment to ethics and human rights. The second is that population policies, rather than concentrating simply on fertility control, can only be effective and humane as part of broader human development approaches that create an enabling environment within which people can attain their health and rights. The third theme gives priority to two strategies: women's empowerment, and reproductive and sexual health services" (pp 5-6).

A reading of the overview and another essay by one of the editors makes amply clear that the editors are quite concerned on the emerging alliance between the 'condom' distributors and the environmentalists. This is a wrong alliance for a right cause. The environmentalists appear innocent and naive on the relationships between population growth, environmental degradation and the pattern of economic development. At the same time, their concerns are genuine and there is a need to incorporate these in population policies and programmes. Gita Sen's essay in this volume ably articulates these concerns and suggests various ideas for integrating population and development issues within an enabling environment. She believes that "environmentalists and women's health activists can build alliances for strategies that promote secure livelihoods, basic needs, and gender equity, not just economic development" (p 8). This will then be a just and right alliance for just causes.

The five essays in the first section are devoted to re-examining the premises of population policies and analytically and intellectually this is the most stimulating section in the volume. The first essay by Sissela Bok, a philosopher (incidentally, she is the daughter of Gunnar and Alva Myrdal, and the spouse of Derek Bok, just retired president of Harvard University), raises the ethical basis of population policies. This is an aspect that has received scant attention in an area where the scope for abuse is indeed very great. Just because population growth may adversely affect the standard of living of a population, can population policies be indifferent to moral issues or basic human rights? Sissela Bok succinctly states the issue:

> Ethical conflicts over population policies concern not only the objectives that we should pursue, singly and collectively, but also the means that we can legitimately employ and that is most desirable in the course of this pursuit. The choices about ends and means when it comes to sexuality, family planning, and childbearing takes place at every level, from the individual to all the way to the international. Because these choices arise in contexts of great diversity, involving gender, class, ethnicity, and religion, there are wide variations in what individuals are able to do, depending on the power relationships in which they stand. But no matter how varied the contexts in which such choices are made, it is important to recognise that the resultant policies often place the largest burden on women, and it is they who have been most often at risk from errors in, or abuses of, policies, customs, and rules (p 16).

She advocates an "expansion of moral space" to include development and population policies for avoiding the likely conflicts between ends and means.

Ethical issues are taken up again from an economic or welfare angle in the contribution by Sudhir Anand. He decries the treating of population as a set of impersonal numbers conflicting with economic calculations, and advocates instead, of treating population as "people". Population policies should take into account people's capabilities in an environment of freedom for maximising the individual well-being. Both Bok and Anand see the critical ethical issue as the reproductive freedom of women.

The ethical issues raised in the first section spills over to the two essays in the second section which deal with human and reproductive rights. The essay by Zeidenstein (Boland, Rao and Zeidenstein) is revealing. When Zeidenstein—who headed the population council for a number of years and thus ought to know—expresses his fears regarding the gross abuse of human rights in implementing family planning programmes, he should be taken very seriously. One feels horrified to read his description of the implementation of the much touted Indonesian family planning programme. To quote:

> 'Norplant' has been administered in part by means of 'safaris'—operations in which family planning personnel, accompanied by soldiers, enter a village, gather the populace together, and expound upon the advantages of family planning, often with an implied threat that the village will be punished if family planning methods are not adopted. These safaris have historically played an important part in Indonesia's family planning programme, typically resulting in village women's mass acceptance of contraception—often of the one method being promoted at that particular moment by the government (p 99).

No further testimony than Zeidenstein's is needed to bring home the gross abuse of freedoms perpetrated in implementing fertility control measures. If these are the ground realities, then how does one make population policy? I take recourse to quoting Zeidenstein again:

> In our view, human rights, particularly women's reproductive rights, must be moved from the periphery to the centre of concern... it would acknowledge that each woman has a right to liberty and security of person, including an absolute right to bodily integrity and to decide herself on matters of sexuality and childbearing with no interference from her partner, family, health care professionals, religious groups, the state, or any other actor. *Coercion* would be expressly defined to include forced abortion, sterilisation, or contraceptive use; the denial of safe abortion; and more subtle activities, such as the imposition of psychological pressure and incentives that compromise voluntary choice. When, for example, a woman who is desperately poor is offered a significant amount of money or social benefits, or is denied them on the basis of dictated reproductive choices, she who is most in need and help is harmed instead (p 100).
>
> In addition to reproductive rights, the policy would guarantee broad equal rights for women with respect to other spheres of life, such as education, training, employment, family relations, property rights, political life, land tenure, and inheritance. It would also ensure that women are free from

harassment, abuse, genital mutilation, and gender-based violence. Moreover, the policy would emphasise social and economic rights that, although included in major human rights instruments, have often been ignored in deference to civil and political rights. Among these are rights to adequate primary health care, housing, social security, education, and nutrition (p 100).

Zeidenstein is obviously advocating the withdrawal of population programmes for the sake of population control. This is quite explicit when he says that "quality of care, rather than demographic targets and numbers of acceptors would be the central concern" (p 100). I wish our health and family welfare ministry takes note of this observation even though they refuse to listen to some of us when we express the same view. Zeidenstein has seen enlightenment but realises that there will be stiff resistance for the new enlightened population policy. He states "the policy would face stiff opposition from the entrenched interests of international donors and governments..., that are wedded to the idea of fertility control enforced from above; from international economic institutions that have recently required "structural adjustments"; and from governments uninterested in social investments. Similarly, it could expect strong resistance from powerful nongovernmental groups, such as "religious fundamentalists of all persuasions, social conservatives, those espousing patriarchal notions of women and the family, and those holding economic power" (pp 100-101). In the light of this statement, there is little hope that the type of population policy advocated in this volume can be implemented in our country in the foreseeable future. Almost all the opposing factors that Zeidenstein mentions are present here now and in great strength.

What is the basic condition required to enforce the new population policy? The third section which addresses this question comes up with "women's empowerment" as the key to this issue. Srilata Batliwala elaborates this concept and the essential conditions for empowering women. Empowerment is a process as well as the result of that process. According to Batliwala "the goals of women's empowerment are to challenge patriarchal ideology (male domination and women's subordination); to transform the structures and institutions that reinforce and perpetuate gender discrimination and social inequality (the family, caste, class, religion, educational processes and institutions, the media, health practices and systems, laws and civil codes, political processes, development models, and government institutions); and to enable poor women to gain access to, and control of, both material and informational resources. The process of empowerment must thus address all relevant structures and sources of power" (p 130). This is indeed a tall order. The policies advocated in this volume strike at the very root of the organisational structure of present societies and therefore a rapid and peaceful transition appears a utopian dream. But many realities have their origin in dreams.

Nearly half the number of essays deal with questions on reproductive health and reproductive rights. The area of reproductive health is a dark area and hidden and unperceived morbidity not only blocks our understanding of the problems and the extent of its severity but also prevents the development of a comprehensive plan of action to tackle the problem. The plan of action envisaged by Adrienne Germain et al includes "broader information and services for women, programmes to encourage men's responsibility for their own sexual behaviour, and research and action to promote healthful and equitable sexuality and gender relations" (p 9). Ian Aitkin and Laura Reichenbach go further and advocate a comprehensive health plan integrating health workers, community and health delivery services to function as a whole. They consider this to be the most cost-effective to deal with reproductive health problems in the long run. There are probably many seminal ideas expounded in the essays on reproductive rights but they are yet to be translated into legal rights and obligations.

In an important essay, Anrudh Jain and Judith Bruce, two of the long-time senior policy planners in the population council, decry their own policies, propounded and implemented through the population council for nearly 40 years, and advocate a new reproductive health approach to population policy. They call for a redefinition of family planning, a reorientation of its goals, and a reassessment of the results. They are against viewing population policy as a fertility reduction policy and family planning as the instrument to achieve that end. Instead, family planning should be the instrument for safeguarding reproductive health and population policies should be no different from development policies. Reducing class, ethnic, and gender disparities through good social and development policy will turn out to be good population policy also. If Jain and Bruce now conclude, after 20 or more years of experience in implementing family programmes, that good population policy is no different from good development policy and that it can succeed only in an egalitarian environment, we should heed to their wisdom and advice. In this context I am reminded of an exchange between a visiting Chinese delegation of parliamentarians and a former chief minister of Kerala. The chief minister is reported to have asked the leader of the Chinese delegation why the Chinese resorted to compulsion in family planning when it was never used in Kerala and both had almost identical birth rates. The answer probably lies in the fact that Kerala women enjoyed greater freedom in exercising their reproductive rights and therefore a voluntary family planning programme achieved a greater degree of success. The lesson is that egalitarianism should include not only economic and social equality but also reproductive freedom for women.

The final essay in the volume by Zeitlin, Govindaraj and Chen is on financing of reproductive and sexual health services. They examine the existing sources of financing of population programmes and conclude that it is basically for financing contraceptives. Estimates of resources devoted to reproductive and sexual health are weak or non-existent. Total health expenditures in many low-income countries are far below needs. Reduction in military spending—in developing as well as in developed countries—can release much needed resources for this area.

The issues raised in this volume deserve immediate attention. The International Population Conference will meet in Cairo in September to take stock of the achievements and problems in the population field since the last meeting at Mexico. This global gathering will also spell out the new directions in population policy for the next decade. If the issues raised in this volume are not widely debated and understood, there is a good chance that the unwitting alliance of the environmentalists and the 'condom' distributors will carry the flag.

This volume has appeared at the most opportune time for us. The Swaminathan Committee has drawn up a national population policy and it may be adopted by default. This is a time for national debate. We may at last adopt a national population policy at a time when the very basis of such a policy is under examination. When population policy experts advocate a comprehensive developmental approach to population we are probably moving away from such an approach. The new approach is not for abandoning population policy but to make it an integral part of development policy. This is the only approach which can respect reproductive freedom and rights and guarantee equality between women and men.

Note: All quotes are from the volume under review. This publication is funded by the Swedish International Development Authority and copies are available free of cost to scholars from the developing countries. Copies can be had from: Director, Centre for Population and Development Studies, Harvard University, 9 Bow Street, Cambridge, MA 02138, USA.

Complex Patterns

Kanakalatha Mukund

Artisans and Industrialisation—Indian Weaving in the Twentieth Century by Tirthankar Roy; Oxford University Press, New Delhi, 1993; pp xi + 243; Rs 290.

TEXTILES and weaving are inextricably mixed with the cultural identity of India, having been the most important part of our economic life, next only to agriculture, over the centuries. So much so that the effects of colonialism and industrialisation on the textile industry have evoked very strong responses among scholars. The received wisdom is that there was a uniform, across-the-board decline in output and employment in all segments of textile production. Tirthankar Roy argues that such conclusions oversimplify the extremely complex set of responses by indigenous crafts to the wide-ranging transformation ushered in by industrialisation and "urges that, rather than worrying about deindustrialisation, it is more interesting to ask what causes institutional changes in the crafts and what institutions make them viable".

To answer these questions Roy looks at the developments in the textile industry in India since 1900, a point of time when the still surviving segments of the handloom industry began to grow. A point repeatedly emphasised by Roy is that the handloom sector was not homogeneous—not in the textiles produced, nor in the markets catered to, nor in organisational features. The survival of handloom production which could co-exist with powerloom units in spite of their very different capital-labour ratios is often explained as the result of the handloom weaver deliberately lowering his returns—i e, by self-exploitation—to offset the productivity advantage of the powerloom sector. Roy offers an alternative explanation for the survival and even growth of handlooms in the present century,—that it was due to the conscious decision of the weaver to use the advantage of product differentiation and diversifying into high value added textiles. This was accompanied by other changes as well—increasing disparities among weavers, urbanisation of weaving and the adoption of techniques that displaced family labour in yarn processing. To some extent, all the accompanying changes were an outcome of the survival strategy of shifting to varieties which did not face competition from mill cloth, which meant that a home-based production unit had to become more open (or vulnerable) in buying yarn and in marketing its production. Integral to this survival was the growing urbanisation of handloom weaving and the development of more factory-like weaving complexes ('karkhanas'), which also led to growing polarisation between the capitalistic weavers and the poorer weavers. These changes had specific regional patterns, and Roy tries to integrate all these diverse strands in this study.

The first two chapters are devoted to quantitative analysis and the main inferences which can be drawn from the available time series data. Comparing the market shares of imported, Indian mill and handloom cloth (pp 28 and 29) what becomes evident is that between 1900 and 1939 the main gainers were Indian mills, while the market share of imported cloth declined proportionately. Handlooms, in spite of some fluctuations, held steady, and even showed a moderate increase in their market share from 27.6 per cent in 1900-1904 to 31.6 per cent in 1935-39. The author draws some tentative conclusions from the data on output, prices and profits. The main trends were: growing inequality across producers, which also meant that surplus capital for accumulation was available to the more prosperous segments; a large part of the growth in output must be attributed to technical change—shifting to better looms and improved process, which weakened the traditional family-based production unit; and, finally, the noticeable diversification into finer and costlier fabrics, in what Roy calls a "deepening of the product structure".

Roy himself prefaces these chapters with an extensive discussion on data constraints, and some of the assumptions from which the conclusions are derived are also perhaps open to debate. To begin with, the discussion on market shares does not convey much in the absence of any estimates on the total size of the market, and whether it grew or remained stagnant or even declined in the period. Also, the argument for widening disparities among weavers is based on the data on profits and wages per yard, between 1924 and 1940 (pp 38, 39 and Figure 3). While wages show a steady, though gradual, decline over the period, profits, after a sharp fall in 1932, maintained a rising trend till 1939, with the gap between profits and wages also widening. Roy's argument is that profits reflect the earning of capitalist ('labour-hiring corporate') weaver households, while wages represent the earnings of poorer weavers with no direct access to the markets. But what was the proportion of the two classes among weaving households? What was the share of profits accruing to merchant/traders, as compared to weavers? Such troublesome questions recur throughout the chapters devoted to statistical data.

The rest of the book analyses various dimensions of the changing world of textile production—in organisation, product mix, the regional variations and technical options. To begin with, Roy points out that by the 1930s, the general perception that the industry was in general decline or in a state of crisis had changed, and the official reports had turned to accounts of the changing organisational arrangements in handlooms. Weavers with no access to the market could sell their cloth through contracts with merchant/traders, either on a 'wage' contract system, or through a 'price' contract. Explaining the differences in the weavers' status implicit in these terms, Roy also says that in the western and southern parts of the country, weavers were a powerful class, and weaver traders were becoming more and more evident. In the eastern and northern regions, however, the merchant/producer divide remained. The exploitativeness of the contracts also depended on the relative strength of the weavers in different regions. While the weavers were quite powerful in Sholapur, in southern Andhra the weavers were subjected to very exploitative terms under the existing class-caste social relations. The migration of weavers to urban centres also developed a class of proletariat weavers employed in larger weaving units. All these changes led not only to capital formation among the large weavers, but also to different sources of capital—from trading and production, from trading in yarn or cloth.

Perhaps the most interesting part of Roy's study is the chapter which discusses the different kinds of demand for cloth and the adjustment of handloom weavers to the competition from imported cloth, as well as Indian mill production. Roy here distinguishes between 'static' and 'dynamic' adjustment. 'Static' adjustment was characterised by the growing specialisation in fabrics and designs where the imported/mill cloth could not

compete. The former included both the coarse ('country') cloth and the very fine, upmarket range of fabrics, while mill cloth dominated in the medium range of textiles. The comparative advantage of handlooms in producing woven (as opposed to printed) designs was especially marked in cloth with contrasting borders and 'pallus', which were used as draped garments (saris, dhotis, etc). Roy observes that the demand for clothing comprised cloth which could be made into dresses by stitching, and cloth which was draped and was thus a 'finished garment'. The latter was usually made with prominent patterns woven on the loom, and contrasting borders with intricate designs, which became the special market which the handloom sector could cater to.

The importance of culture-specific consumer behaviour and its impact on production activities has not really been highlighted till now. In the Indian context, two patterns of demand were to be seen. While women, by and large, stayed with traditional garments, men shifted to more western-style clothing which involved stitching. To Roy, the response of the industry to this changing demand pattern and shifting to the production of piecegoods was a process of 'dynamic adjustment'. The invention of synthetic chemical dyes in the 19th century revolutionised textile technology. For India this meant the total eclipse of vegetable dyeing and dyers, and following a relative long experimental phase of using the new dyes, gradually more standardised production with more even quality evolved, marked by some more institutional ('dynamic') changes.

One of the noteworthy developments in the period till 1940 was the growing urbanisation of weaving. In 1940, 45 per cent of the looms in Madras presidency were in towns, while the comparable figures for Bombay and central provinces were 35 per cent and 19 per cent. This trend was more prominent in the south and west than in the north and east. Roy concludes that the level of urbanisation of a region was closely linked to the urbanisation of weaving, which also led to more large-scale weaving units and a more diversified product range.

A part of the changing scenario of textile production was the adoption of more cost-effective technologies, both in loom design and the recourse to mill warping. Roy cautions that though the data on these modifications is very unclear, it can be seen that provinces with more progressive industry departments had switched over to fly shuttle looms to a greater extent. The growth of small-scale power looms was also an important development, especially since this was an outcome of capitalistic handloom weaving, and has to be understood in that context.

The book concludes with a review of government policies in the colonial and post-independence period. The author is particularly critical of present-day government policy which treats all handloom weavers as an undifferentiated group, overlooking economic and social disparities within the group.

This book is an interesting addition to the 'new' orthodoxy in economic history writing which stresses that indigenous institutions were not merely passive pawns under the forces of colonialism and industrialisation, but were sturdy survivors who could adapt to the new conditions in a changing world. The book's strength—and its weakness—is that it aims at providing a comprehensive overview of the response of Indian handlooms, a major craft-based production system. The adjustments and processes were extremely complex, with very distinct regional differences and internal differentiation within the producing classes. In trying to capture all these strands within a mere 240 pages, the book is often jumpy, and makes for rather difficult reading. A more straightforward account region by region may have added to the clarity and readability.

Rural Co-operatives: Conditions for Success

H B Shivamaggi

Rural Financial Institutions: Promotion and Performance by Bhupat M Desai and N V Namboodiri; Oxford and IBH Publishing Co, 1993; pp xiii + 78.

AS a result of the ritualistic approach and the lack of genuine concern for the upliftment of the co-operative rural credit structure on the part of political leadership, this credit system continues to stagnate. The real problem lies at the primary level, whereas even today the in-charge apex institution NABARD talks mainly of launching "an action plan for improving the viability of state and district level co-operative banks". When NABARD signs memorandums of understanding with the concerned state governments for this purpose, it will surely insist on a time-bound action programme for the restructuring and activating of the primary societies for enabling them to reach a higher stage of development as multipurpose societies. The question is: to what extent are political interference and lack of co-operative leadership the cause of the present stagnant situation? It is in this context that the study under review acquires significance for policy-makers and programme implementors.

This study is the 161st monograph of the Centre for Management of Agriculture in the Indian Institute of Management, Ahmedabad. Based on the case-study approach, it examines the performance of two rural financial institutions (RFIs)—Anad Farmers' Co-operative Bank and Aruvikara Farmers' Co-operative Bank in Kerala—when they functioned as Primary Agricultural Credit Societies (PACS) and later when they emerged as Farmers' Service Societies (FSS).

The study has addressed the following two questions: (1) what organisational principles are involved in promoting RFIs? and (2) what is the performance of RFIs like PACS and FSS? To start with, the authors enunciate the following four organising principles for promoting any RFI:

(i) Vertical integration of the organisational structure of field-level offices of the RFIs;
(ii) density of field level offices of the RFIs;
(iii) coverage of farmers and other clients by the RFIs; and
(iv) diversified and multiple products which are horizontally integrated, that is multi-functional role of the RFIs.

The performance of the two selected rural co-operative financial institutions is evaluated on the basis of nine criteria derived from the four organising principles mentioned above: (1) vertical organisation, (2) density of field offices, (3) coverage of farmers with special reference to weaker sections, (a) membership and (b) borrowing membership, (4) inequality in the distribution of loans, (5) average transaction costs, financial costs and profitability, (6) size of operations per society to quantify scale of operations, (7) composition of credit and non-credit operations, (8) scale and scope economies in these costs, and (9) loan delinquency rate. In addition, the study also reviews the performance at the level of farmers and other clients by selecting 5 per cent of the rural households

in the sample area of operation of the two selected FSS. The required data for the two FSS were gathered for 25 years so as to obtain a detailed performance picture when they worked as PACS and later when they became FSS.

Besides the introductory chapter, the monograph contains three more chapters, one each on the two FSS followed by the final chapter on conclusions and implications. There are four figures and 48 tables.

The Anad Farmers' Bank started as a Credit Society in 1924, became a service co-operative in 1960, a service co-operative bank in 1974 and in 1978 it was converted to become a Farmers' Service Co-operative Bank covering two panchayat areas with 60,000 population and 4,200 hectares of cultivated land mainly under cash crops. The area has adequate development infrastructure—all-weather pucca roads, electricity, market yards, etc. Without going into further details in this brief review, mention may be made of the fact that the society has a long history of sound financial management and multipurpose functioning. Its deposit mobilisation, on an average, was nearly Rs two lakh when it was only a PAC while this figure jumped to Rs 103 lakh after it became an FSB. Its dependence on funds from DCCB was only around 39 per cent of loanable resources whereas it was as high as 66 per cent when it was only a PAC. It has two branches besides the head office, three field offices, five input depots, six procurement centres and 12 consumer stores. Both the branch offices and head office are housed in their own buildings. The number of members is 13,865 as against 12,352 households in the area. The members borrowing non-agricultural loans formed about 46 per cent of total members, the corresponding percentage for agricultural loans being 28 per cent. Only 22 per cent of the outstanding loans were overdue.

The Aruvikara FSB came up as a society of mutual help in 1924 and became an FSB in 1979. Its area of operation has 6,617 families with 18,432 persons. As in the case of the first bank, the area has adequate development infrastructure. Cash crops are the main crops of the area. The FSB has 9,130 members with the percentage of borrowing members being 75. Its deposits stood at Rs 30 lakh and its dependence on funds from DCCB has come down from 71 per cent when it was a PAC to 61 per cent when it became an FSB. It is a multi-functional bank with one branch, four consumer stores, three input depots and one procurement centre. Its loan recovery position at 10 per cent of overdue loans was better when it was a PAC as compared with the corresponding percentage of 40 now when it is an FSB.

While this research work has brought out that the performance of PACS is distinctly better when they became FSB because of larger area of operation, larger membership and combination of credit and non-credit activities, it could have also highlighted that primary level co-operatives in Kerala are working successfully because of five factors, viz, non-interference by government, higher literacy, larger deposit mobilisation and less dependence on central financing agency, predominance of cash crops and multi-functional operations which meet all the local needs—credit, farm inputs, consumer goods and procurement of produce. Being a case study, a few points about the men behind these two primary level co-operative banks—their age, profession, income, election system, their degree of active involvement as reflected in the managing committee meetings, the main list of agenda items, etc—would have told us to what extent good leadership can make efficient and viable rural financial institutions.

There is a need for more and more such case studies to bring out the success of primary level rural financial institutions in different parts of India and to highlight the factors underlying their success.

Though this is a modest research effort relating to co-operatives, the authors are apparently shy to mention 'co-operative' in the title of the publication.

Restrictive Trade Practices in India, 1969-91

Experience of Control and Agenda for Further Work

J C Sandesara

This paper evaluates the experience of control of restrictive trade practices (RTP) in India by the Monopolies and Restrictive Trade Practices (MRTP) Commission under the MRTP Act, 1969. This experience is examined by a statistical analysis of RTP inquiries instituted and disposed of by the commission since the enactment of this legislation till 1991 to which the latest published information relates. Based on this evaluation, as a second objective, the paper also presents an agenda for further work in this area.

I
Introduction

THIS paper purports to appraise principally the experience of control of Restrictive Trade Practices (RTP) in India by the Monopolies and Restrictive Trade Practices (MRTP) Commission under the MRTP Act, 1969. This experience is examined by a statistical analysis of the RTP inquiries instituted and disposed of by the MRTP Commission since the enactment of this legislation in 1969 till 1991 to which the latest published information relates. Based on this experience, as a second objective, this paper also presents an agenda for further work in this area.

There are, to be sure, a number of books dealing, exclusively or importantly, with RTP in India.[1] Generally speaking, this literature covers this subject by reproducing orders/judgments of the MRTP Commission/Supreme Court/high courts, fully or in a summary form, or by giving the provisions of the MRTP Act and the rules framed thereunder, and explaining and elaborating the same with notes and the case-laws. While useful in its own way, this material is not a substitute for the statistical analysis of the kind referred to in the above para. None of the books which we perused before we embarked upon this study, dealt with such an analysis. There, thus, existed a gap that needed to be filled in for an assessment of the efficacy of control of RTP. This paper is a modest attempt in that direction.

Secondly, this subject is topical. Following the New Industrial Policy of 1991, the MRTP Act was amended in 1991. This amendment has removed the threshold limits of assets in respect of MRTP companies and dominant undertaking and the related provisions on their expansion, etc. The policy also announced that emphasis will now be placed on controlling and regulating monopolistic, restrictive and unfair trade practices. Earlier, some economists had advocated a basic change in the approach to the control of RTP in the MRTP Act from the rule-of-reason to the *per se*.[2] Recently a group of experts have also advocated such a change.[3] In the context of this debate, our views on this subject, based on the above analysis and a scrutiny of the arguments advanced in this behalf, given at the end of this paper, would, we hope, be of some value in the discussion.

This paper is presented in five parts. The following part gives the background of the MRTP Act, and outlines the scope of this study. The third part presents an account of this legislation, and describes the nature of statistics. The fourth part deals with the statistics relating to RTP. The final part lists the agenda for further work. An outline of the subtopics dealt with in these parts will be found at the beginning of each part.

II
Background and Scope

We first trace the developments leading to the enactment of the MRTP legislation in 1969. This is followed by a discussion on the question of priority of the basic objective of the act, namely, prevention of concentration of economic power, and the specifics of concentration covered under the act. Finally, we delineate the scope of this study.

Background

The Constitution of India says, "The State shall, in particular, direct its policy towards securing" (and then continues in parts (b) and (c) respectively), "(b) that the ownership and control of the material resources of the community are so distributed as best to subserve the common good, and (c) that the operation of the economic system does not result in the concentration of wealth and means of production to the common detriment".[4]

These concerns for a fair distribution of income and wealth and prevention of undue concentration of economic power have always figured prominently in the official policy documents of the government of India since then. Thus, for example, the Industrial Policy Resolution of 1956, the Industrial Policy Statements of 1977 and 1980, and the Five-Year Plans all list these as major objectives of government of India's policy and plans.

Further, the question regarding whether the operation of the economic system has resulted towards progress on these objectives or their retardation, and the extent of change thereon has been investigated by a number of official committees/commissions and researchers, and based on the suggestions/recommendations of these bodies, government have taken a number of legislative and other remedial measures as a follow-up.

To refer to some major and influential works on this subject: In 1964, the P C Mahalanobis Committee[5] reported that the working of the economic system has resulted in an excessive (in the sense of more than what can be justified or considered necessary) concentration of wealth and income in private hands, and pleaded for more comprehensive inquiries into the questions and issues related to such concentration. In 1965, the K C Das Gupta Commission,[6] appointed as a follow-up of this plea, reported that in a large number of industries, markets were monopolistic/oligopolistic, that monopolistic/restrictive trade practices were not rare/prevailed on a large scale, and that concentration at the aggregate level was substantial. To prohibit such practices and to control monopolies/oligopolies and aggregate concentration, the commission recommended a number of non-legislative measures, and also an enactment for which it gave a draft of "The Monopolies and Restrictive Trade Practices Bill, 1965".

The draft Bill was based on two principles: one that the country "needed highest production possible" and two that "it is achieved with the least damage to the people and secures to them the maximum benefit".[7] The bill was widely discussed and debated both in parliament and outside for long, and finally became an act in 1969. The act became operational from the next year.

Of the several noteworthy developments which propelled the enactment, three were

perhaps very influential. The first was R K Hazari's report[8] submitted in 1967 and the second was S Dutt Committee's report[9] submitted in 1969. These reports highlighted how the working of the licensing system had helped increase concentration of economic power in private hands, especially of established business houses, partly by deterring/restricting entry of new groups. This development, in those days was popularly regarded as concentration working to the common detriment. The third development was political when the Congress Party was split in 1969 on the ground of reorienting economic policies, radically to the left. This was perhaps the most influential event. This act, and other measures such as nationalisation of banks in 1969 were considered as providing convincing evidence that the government would keep the promises given at the party platform while announcing the split.

THE QUESTION OF PRIORITY

Although prevention of undue concentration has been one of the major objectives, there have been other objectives also in India's economic policy and planning. So the two questions in this context are : What are these objectives? And how high is the prevention of concentration objective *vis-a-vis* these other objectives?

We may deal with these questions, beginning with the position as given in the Constitution itself. At the outset, reference was made to Article 39(c) from whence it must have been noted that the article does not attack concentration *per se*; what it attacks is only that concentration which produces or leads to common detriment, or is likely to do so.

The phrase common detriment is wide open, and it is not easy to grasp it unambiguously. Thus, for example, Article 39(a) of the Constitution directs the State towards securing "that the citizens, men and women equally, have the right to an adequate means of livelihood", and Article 43 asks the State to endeavour to secure "to all workers .... a living wage", and in particular "to promote cottage industries".[10]

It does not require an in-depth examination to conclude that these objectives conflict in practice, at least in the short run. Thus, for example, high concentration resultant from technological and pecuniary economies of scale, and X- and allocative efficiencies promote in the short run rapid growth and a living wage to those employed. This is common good. But it also promotes in that period only a low employment growth. This is common detriment. Or to put the matter differently, by taking another example, promotion of cottage industries leads to faster employment growth in the short run, but such industries have only low-efficiency and are poor pay-masters. The first is common good; the second is common detriment.

Since the objective of prevention of concentration of economic power in private hands has been largely discussed in the context of industrial policy and planning, it is worthwhile to examine this question elaborately in that context. In industry, we have been having a number of objectives, in particular rapid growth, reduction in regional imbalances, protection/promotion of small industry, besides of course the objective on concentration. Take, for example, the case of establishment of a large plant in an industrially underdeveloped area by a large private company/ business house. On the regional balance objective, this establishment subserves common good. On the other hand, on the concentration objective it produces common detriment. Also, in view of pre-emption of some resources for the needed infrastructural investments in the underdeveloped area when bereft of it, fewer resources are available for investment directly in industrial/manufacturing activity. Thus, industrial/manufacturing growth will only be small in the short run. So this also is common detriment on the growth objective.

As a final illustration on this point, we refer to the Das Gupta Commission's report. While much concerned with the undesirable consequences of excessive concentration it has documented, and for which it has suggested remedial measures, the report has also recorded the achievements of concentration. Of the several passages on the latter, the following three seem to be the most telling: (1) "Big business has done much for the country's economic betterment and as a consequence for the alleviation of the poor men's misery." (2) ". . what little development there is owes much to the adventure and skill of a few men who have in the process succeeded also in becoming 'big business', thus concentrating in their hands a great portion of the economic power controlling and directing the production and distribution of national wealth and income. It is fair also to state that after concentrating power in their hands these men have gone on often to push forward development of further industries, which has been to the advantage of the country." (3) ".... economic power may be relied upon to make important contribution to industrial development in the years to come."[11]

A close reading of the above as also of several other passages on the objectives of industrial policy and planning leaves two things reasonably clear. We have been having several, mutually conflicting objectives, and that there is no clue on the question of priority among these objectives, nor a suggestion as to the method that could be deployed to settle this question. To put it differently, on paper all objectives seem to enjoy or suffer from equality in priority.

If, however, one looks at and observes closely what the government have been doing in practice, rather than what they have been speaking or writing, one gets some inkling on this question. It seems that almost throughout the last four-and-a half decades since independence, but especially since the beginning of the Second Plan in 1956, the objective of rapid industrial growth has been pursued more vigorously than the other objectives of industrial policy and planning, including the objective of prevention of concentration of economic power. We have argued in detail for this conclusion elsewhere,[12] on the basis of relative allocations of outlay to the small and the large industrial sectors and on a chronological listing of policies/measures adopted to subserve these various objectives. So here only references to the points relevant to the concentration question should suffice.

First, whereas industrial growth objective has been pursued vigorously at least since 1956, the legislation to control concentration was enacted in 1969, nearly 20 years after the launching of the planned economic development. Second, the enthusiasm of the government to control concentration, with the help of the MRTP Commission seems to have diluted within three-four years of the enactment, as is seen from a limited number of references for inquiries government began making to the commission relating to the MRTP companies in respect of their application for expansion of their business in various ways. In fact, this has been a major point of tension between the commission and the government as can be seen from their respective reports of the earlier years.[13] Third, from time to time government have been making relaxations for expansions and growth of large companies/ business houses on a variety of grounds such as priority industries, location in backward areas, exports, etc. The most significant and widely noticed relaxation relates to the raising of the asset limit of the MRTP company from the original limit of Rs 20 crore to Rs 100 crore in 1987 and the abandonment of the very concept of the MRTP company itself in 1991. Fourth, the new industrial policy of July 1991 has thrown open a large number of areas earlier reserved for public sector for the private sector, including multinationals. Finally, government have commenced disinvestment from the public sector. The areas vacated by the public sector are expected to be filled in by the private sector, in some of which large companies/business houses will, therefore, play a more prominent role now.

This review highlights the point that since around mid-70s the government have seen more clearly the conflict between the objectives of rapid growth and prevention of concentration of economic power in private hands, and have been moving, especially

since 1991, more openly and more boldly to settle the question of priority, in favour of the growth objective. Thus, the objective of prevention of concentration of economic power in private hands has now become an objective of lower priority than before.

Specifics of Concentration

The foregoing discussion on the antecedents and the priority of the concentration objective has been in general terms. It is time to be specific.

One may distinguish between concentration at the macro-level and concentration at the micro-level. At the former, it relates to the share of a certain specified number of large (generally private) companies/business houses in the total of the corporate sector or the national economy. The share is measured on the criterion of assets, sales, employees, etc. The larger the share of that number, greater the concentration. The concern for high concentration of this kind arises principally on the ground that, coupled with wide distribution of political power as is the case in well-functioning democracies, it may rob political democracy of its good meaning, and may also produce adverse social consequences.

Concentration at the micro-level relates to the share of a certain specified number of large private companies/business houses in the total sales/production in the industry/market in which the companies operate. The larger the share of that number, greater the concentration in the industry/market. The concern for high concentration of this kind arises out of the fear associated with monopolistic/oligopolistic markets which it creates. Firms in such markets are known to suffer from various kinds of static and dynamic inefficiencies—allocative, X- and technological. And that is common detriment.

A third type of situation which may result in the outcome being prejudicial to public interest or producing common detriment relates to the adoption by firms of different types of anti-competitive practices such as monopolistic and restrictive trade practices, or misleading practices such as unfair trade practices. While it is easy and common for firms working in monopolistic/oligopolistic markets to adopt such practices, it is not difficult nor uncommon for firms working in other markets also to do so. Examples of such practices are: limiting technical development, collective price fixation, tie-up sales, exclusive dealings, misleading advertisements, etc.

It is for these reasons that anti-trust legislations of the capitalist countries have provisions to control situations of concentrations and anti-competitive and misleading trade practices, though, as one would expect there are significant differences in their respective legislations.

Scope of the Study

The Preamble of the MRTP Act reads as under: "An Act to provide that the operation of the economic system does not result in the concentration of economic power to the common detriment, for the control of monopolies, for the prohibition of monopolistic and restrictive trade practices and for matters connected therewith or incidental thereto".

Interpreted specifically as per the outline given under the previous heading, the broad objectives of the act, as translated from the Preamble, may be given as under:

(i) *At the Macro-level*: Avoidance and prevention of concentration of economic power that is or that may lead to the common detriment;

(ii) *At the Micro-level*: (a) Control of monopolies, (b) Prohibition of monopolistic and restrictive trade practices.

The act has been amended several times since 1969, in 1980, 1982, 1984, 1985, 1986, 1988 and 1991. Besides, from time to time, rules have been framed to carry out the objectives of the act. Of the amendments referred to, those of 1984 and 1991 are comprehensive and far-reaching relative to others, as they were based, respectively, on the recommendations of the Rajindar Sacher Committee made in 1978[14] and on the recent path-breaking liberalisation policies, in particular of the New Industrial Policy of 1991. To refer to some of these provisions: The 1984 amendment brought into the act the provisions for the regulation of unfair trade practices, and created a new authority of the Director-General of Investigation and Registration, replacing the twin authorities of the Director of Investigations and the Registrar of Restrictive Trade Agreements. The 1991 amendment deleted the concept of the MRTP company, and repealed, as a follow-up, almost all provisions relating to their expansion. It also withdrew generally the exemption of the public sector from the provisions of the act. In brief, the amendments have enlarged the scope of the act by bringing into fold of control unfair trade practices and public sector and reduced its scope by removing from control the situations of aggregate concentration.

The scope of this study is restricted to the working of the act in regard to RTP. The reasons for excluding the working of the act in other areas and limiting it to RTP are spelt out below:

(1) A study of the working of the aggregate concentration under the act has now become only of historical value. As mentioned above, the 1991 amendment has deleted the concept of the MRTP company, and as a follow-up, repealed the provisions regarding their expansion, etc. Secondly, even before that, the commission was asked to inquire into the situations of aggregate concentration in a limited number of cases, and that too during the first three-four years of the act. Almost all cases of the later years were disposed of by the government directly. Thirdly, although the provisions relating to division of

Note: For explanations on statistics, refer to the text under the heading *Registration of Agreements* in Part III.

Source: Government of India, Ministry of Law, Justice and Company Affairs, Department of Company Affairs, *Annual Reports Pertaining to the Execution of the Provisions of the Monopolies and Restrictive Trade Practices Act, 1969*, New Delhi.

undertaking and severance of inter-connections of undertakings remain, though in a modified form, the work in these areas has been either nil or negligible. Thus, for example, there has so far been no inquiry into the severance; and as regards division, only two inquiries have been instituted of which one reference was withdrawn, and the other is in appeal before the Supreme Court.

(2) The other two exclusions relate to monopolistic trade practices and unfair trade practices. As to the former, between 1973 when the first inquiry was instituted and 1991 for which the latest report is available, only 16 inquiries were instituted. Of these, as at the end of 1991, 6 were pending before the commission on account of stay granted by Supreme Court/high court or other reasons. The remaining 10 inquiries were dropped, withdrawn, or had become infructuous. So in the monopolistic trade practice area, there is precious little available for assessment.

(3) For two compelling reasons, we have excluded unfair trade practices also from this study. First, though they do have economic significance and affect competition, they are more in the nature of unethical practices such as false/misleading advertisement, deceptive bargain sales, sale of unsafe goods, etc. A study of such practices is not particularly relevant from the industrial organisation perspective in which the focus is, among others, on other restrictive trade practices such as collective price fixation, tie-up sales, resale prices maintenance, etc. which, while restrictive of competition, are not unethical. The study was initially designed to focus on such practices. The inclusion of unfair trade practices would have altered the basic thrust of this research. Second, even though the provisions regarding unfair trade practices were inserted only in 1984, the MRTP Commission has done substantial work since then in this area. Between 1984 and 1991, nearly 1900 inquiries were instituted for disposal before the commission, of which about 1400 have been disposed of. Additionally, a lot of work in controlling these practices has been done under the legislations of central and state governments, such as Consumer Protection Act, Food and Drug Adulteration Acts, etc. In fact, in certain areas, unfair trade practices are controlled more expeditiously and more effectively under these legislations than under the MRTP Act. The idea of overlap between the MRTP Act and the Consumer Protection (CP) Act, 1986 can be had from the fact that the two acts have the same meaning of Unfair Trade Practices. In fact, the entire Section 36A of the MRTP Act on the definition is reproduced as clause (r) of Section 2(1) of the CP Act. These practices relate broadly to unfair/deceptive/unethical methods/practices adopted in promoting the sale, use or supply of goods or provision of services. It may also be mentioned that in regard to RTP, whereas the MRTP Act deals with all RTP, the CP Act can deal only with the tie-up sales/services. In order to have a fair idea on the efficacy of control of unfair trade practices, it would be necessary to assess the work under all related legislations, including the one under the MRTP Act. This is a huge task, and was ruled out as being out of bounds of the time and the funds available to us for this study.

(4) On the other hand, a study in the area of RTP under the act commends itself for various reasons. First, unlike in the area of unfair trade practices, the provisions in this area have been in the act from the very beginning since 1969. Also, unlike in the area of aggregate concentration, the inquiries into RTP can be instituted from a number of quarters—consumers/trade or consumer association, central/state governments, director-general and the commission itself. As a result, and as would be seen from Part IV, the commission has done a substantial amount of work in this area relative to other areas and as such. Second, unlike in case of monopolistic trade practices/aggregate concentration, the commission's orders in RTP inquiries are mandatory, subject to appeal only to the Supreme Court on a substantive point of law. This provision gives generally a measure of finality to the commission's orders. Third, in view of the recent liberalisation and pro-competition policies of the government, a study of RTP assumes special significance, and following what is stated in the New Industrial Policy of July, 1991 one may expect the law to control such practices more vigorously than before.

Finally, while the anti-trust policies of a number of countries such as the US, the UK and other EEC countries have been examined by members of varied professionals like lawyers, accountants and economists and a lot of literature has been produced by them, to the best of our knowledge the literature on the Indian legislation is largely by students of commerce and law.[11] Students of economics in India seem to have kept a safe distance from this legislation. This work is a modest attempt in that direction, which, for reasons given above, is limited to the working of the RTP under the MRTP Act.

III
The Act and the Statistics

In this part, we first give and explain the main provisions of the MRTP Act in regard to RTP, and then describe the nature of statistics available under different heads, noting alongwith their limitations also.

Provisions on RTP

The principal provisions in regard to RTP in the MRTP Act are described below. They are presented under the three heads of Definitions, Registration and Inquiries and Orders.

A couple of clarifications are in order here before we go to the description. First, as noted in Part II, the MRTP Act has undergone several amendments since 1969 when the act was promulgated. This description, however, is restricted to presenting the latest position. No references are made to the earlier provisions that may have been there differently. Secondly, the act is a legal document, and the legal language often perplexes or confuses the reader not familiar with that language. This is largely because the law has to be as precise as possible, and in being so the main thrust of the provisions is often accompanied by explanations, qualifications, modifications and exceptions to the thrust—all of which often make it difficult for the ordinary reader to get the essence of the provisions. The description that follows is in simple, non-legal language to facilitate the reader to grasp the main points of the provisions quickly. Such a description can clearly not do full justice to the provisions of the act, but here it is preferred for its simplicity.

Definitions

The phrase in RTP is comprised of three words, and it is well to begin with the meaning of each.

Trade is defined widely, to include, besides trade, business, industry, profession or occupation, and relates to production, supply, distribution or control of goods, and includes the provision of services [Section 2-(s)].

Trade Practice is any practice relating to the carrying of trade. The practice relates

Table 2: Restrictive Trade Practices Agreements in Force, 1979-84

Year	Number of Agreements In Force	Number of Agreements Registered	(2) as Percentage of (3)
(1)	(2)	(3)	(4)
1979	6289	22152	28.4
1980	6874	22737	30.2
1981	7394	23257	31.8
1982	7872	23735	33.2
1983	8891	24754	35.9
1984	11678	27541	42.4

Source: Same as under Table 1.

to anything in regard to the price and related matters involved in trade and includes a single or isolated action [Section 2-(u)]. Central to the definition of RTP is the concept of restriction on competition by trade practice. RTP must have, presently or potentially, the effect of restricting competition, by preventing, distorting or limiting it in any manner. The particulars thereof as specified are: by obstructing the flow of resources into the stream of production or bringing about the manipulation of prices and other terms to effect the flow of supplies in the market in such manner as to impose unjustified costs or restrictions on the consumer [Section 2(o)].

Is the intent of the legislation to promote competition? The answer seems to be both: Yes and No. Yes, in the sense that the law frowns upon prevention, distortion or limitation of competition, which otherwise exists or might exist. It thus promotes competition passively or negatively. And no, in the sense that it does not otherwise actively or positively promote, i e, encourage competition. To put it differently, competition is viewed as a 'natural order' or natural course of events. It should be allowed to move on its own momentum. It is only the obstructions in that order/movement which must be removed.

Registration

All agreements relating to RTP have to be registered with the Director-General of Investigation and Registration. Agreement includes arrangement or understanding, and may or may not be intended to be enforced [Section 2-(a)]. Further, all agreements of the type relating to practices specified separately [Section 33(1)] are deemed to be RTP agreements and therefore have to be registered. The agreements specified relate to (i) restrictions on persons, (ii) tie-up sales/full line forcing, (iii) exclusive dealing, (iv) collective price-fixation, (v) discretionary benefits/price discrimination, (vi) resale price maintenance, (vii) withholding supply/territorial restrictions, (viii) restriction on employment of methods of production, (ix) collective boycott, (x) predatory pricing, (xi) refusal to deal, (xii) collusive bidding, (xiii) agreements notified by central government, and (xiv) enforcement-related practices [Section 33 (1)(a)to(l)]. However, agreements to which the central government is a party or which are authorised/approved by the central government are exempt from registration [Section 33(2)].

One may distinguish between horizontal, vertical and unilateral RTP. Horizontal practices relate to restrictions between competing suppliers in the same market (e g, collective price fixation or collective boycott). Vertical practices relate to the restrictions between non-competing parties, say, in a seller-buyer relationship (e g, resale price maintenance or tie-up sales). Unilateral practices relate to a single or isolated action of a supplier (e g, anything done by a supplier to control or affect price or other terms of sale).

Inquiries and Orders

The inquiries into RTP are made by the MRTP Commission. The commission can initiate an inquiry even without the existence of or the restrictive nature of the practice.

The inquiry may be initiated at the instance of (i) a trade association, a consumer or a registered consumers' association, (ii) central government or a state government, (iii) Director-General, or (iv) the commission itself [Section 10(a)(i) to (iv)]. In case of inquiries originating from the parties other than, (iii) listed above, the commission may ask the Director-General to prepare a preliminary investigation report for the commission to satisfy the latter on whether the matter should be formally inquired into or not [Section 11(1)]. Besides, the Director-General may also prepare such a preliminary report on his own [Section 11(2)].

If after the inquiry, the commission comes to the conclusion that the practice is prejudicial to public interest, it may pass a cease and desist order, or pass an order declaring agreement/ parts thereof relating to restrictions void or asking suitable modifications thereon [Section 37(1)(a) and (b)]. Or instead of passing an order, at the request of the party, give a 'consent order' permitting the party to modify the practice in a manner whereby it ceases to be prejudicial to public interest [Section 37(2)].

There is a presumption in the act that RTP are prejudicial to public interest. If, however, in the inquiry, the practice passes through one or more 'gateways', and further if advantages thereof outweigh the detriment to the public, that presumption is withdrawn. Thus, the passing through the gateway is a necessary, but not a sufficient condition; sufficiency requires the passing of the balancing test also [Sections 38(1)].

The burden of establishing the fact as to the existence of RTP is on the complaining

Table 3: Restrictive Trade Practices Inquiries Instituted, 1972-91

Year/ Section (1)	Number 10 (a) (i) (2)	10 (a) (ii) (3)	10 (a) (iii) (4)	10 (a) (iv) (5)	Total (6)
1972-81	15	2	154	222	393
	(4)	(0.5)	(39)	(57)	(100)
1982-91	156	—	2032	893	3081
	(5)	—	(66)	(29)	(100)
1972-91	171	2	2186	1115	3474
	(5)	(0.05)	(63)	(32)	(100)

39(2)]. The only exception permitted is in regard to 'a loss leader', i e, when a wholesaler/retailer is selling a product at a low (below cost) price [Section 40]. The loss leader may do so either to attract custom for other products sold by him, or to damage the reputation of the product or its supplier.

Thus, 'no gateways' are available for RPM. But the agreements thereon have to be registered.

The commission may, however, exempt goods from these special provisions on the ground of adverse effect of the prohibition of RPM on quality, variety, price, after-sales service, etc, of the product [Section 41]. The orders of the commission on the exemption application are final.

Rule-of-Reason and *Per Se* Approaches

The legislations to control monopolies and the conduct of firms are viewed as following, generally, either the rule of reason approach or the *per se* approach. The former recognises that certain kinds of situations or conduct/practices may be conducive to the promotion of consumers' welfare or of certain social objectives, such as on exports, employment, regional balance, etc, and that the gains on one or more of these considerations may offset the harm to competition that they cause. Under this approach, the prosecution is on a case-by-case basis. On the other hand, the *per se* approach does not recognise the compensating circumstances or gateways. All that is required there is to establish the facts, and once that is done, RTP are declared to be illegal.

Inasmuch as the point in the dispute under the *per se* approach is limited to the establishment of fact, the prosecution is less expensive and less time-consuming. Also, this approach defines legality of RTP more closely and may better deter abuse. Its limitation arises out of its rigidity, as it does not allow a consideration of possible gains that may arise on efficiency-improving ground or on the ground of promoting social objectives. Here, the rule of reason approach scores over the *per se* approach. Its relative disadvantages, however, are that it is expensive and time-consuming, and its power to deter attempts to bad conduct are limited.

Finally, we may draw attention to a potential danger that lies in adjudication proceedings under the *per se* approach. As this approach provides for dogmatic, immutable rules, rhetoric may get mixed up with thought and information in interpreting the complex, changing real world situations and practices against these rules. Such a possibility is clearly less under the rule-of-reason approach which demands more of information and thought, and so it leaves little room for rhetoric.

It may have been noted that the provisions on the control of RTP in the MRTP Act (and in general indeed for other anti-competitive practices and situations) are based on the rule-of-reason approach. The exception case in RTP is RPM which is sought to be controlled, by and large, under the *per se* approach.

Statistics and Their Limitations

Our statistics relate to four items: the number of agreements, the number of inquiries instituted, the number of inquiries disposed of by order, and the number of inquiries in which different types of RTP were investigated in the inquiries disposed of by order. While we deal with these statistics in the next part, here we describe their nature and note their limitations.

These statistics are taken almost wholly from the annual administrative reports pertaining to the execution of the provisions of the MRTP Act, 1969 issued by the Ministry of Law, Justice and Company Affairs, Department of Company Affairs, Government of India, New Delhi. These reports are in two parts. The first part of the annual report is of the Department of Company Affairs, and the second of the MRTP Commission. While we have examined both of these parts, for a large part of the statistics we have gone by the second part, especially its appendices.

Registration of Agreements

All RTP agreements have to be registered with the Director-General. The agreements must include the particulars regarding the names of the parties to the agreement and the terms of agreement [Section 33(1)]. Certain agreements (specified under 33(1) (a) to (l), summarised earlier in this part, are deemed to be registrable and hence are to be registered. The Director-General is required to maintain a register of these agreements [Section 36].

Our statistics relate to the number of agreements filed and registered during, and at the end, of the year for the years 1973 through 1989. In addition, we have statistics on the number of agreements in force at the end of the year for the period 1979-1984. These are the only years for which these statistics are available.

Inquiries Instituted

Here, as also under the following heading on Inquiries Disposed Of, the statistics relate to the period 1972-1991. 1972 was the year when the first inquiry was instituted and also disposed of, and the latest published report relates to 1991.

As noted earlier in this part, the inquiries can be instituted at the instance of (i) a trade association, a consumer or a registered consumers' association, (ii) central government or a state government, (iii) Director-General, or (iv) the commission itself [Section 10(a)(i) to (iv)].

It must be remembered that the statistics relate to the number of inquiries. In an inquiry, there may be more than one party, and against a party there may be an allegation of more than one RTP. Thus, for example, in the RTP inquiry No 25 of 1979 instituted by the commission, there were nine parties. Or, to take another example in the RTP No 17 of 1981 instituted by the Director-General, five different types of RTP were alleged, namely, resale price maintenance, differential dealing, restriction on persons and on methods of trading, tie-up sales and territorial restriction.

Table 4: Restrictive Trade Practices—Inquiries Instituted, 1972-91

Year/Section	Number				
	10 (a) (i)	10 (a) (ii)	10 (a) (iii)	10 (a) (iv)	Total
(1)	(2)	(3)	(4)	(5)	(6)
1972	—	—	10	—	10
1973	1	—	2	3	6
1974	2	—	19	13	34
1975	1	—	30	66	97
1976	4	—	41	45	90
1977	3	—	3	40	46
1978	2	1	4	28	35
1979	—	—	19	8	27
1980	1	1	12	6	20
1981	1	—	14	13	28
1982	1	—	9	19	29
1983	2	—	12	38	52
1984	8	—	38	109	155
1985	4	—	16	113	133
1986	33	—	63	133	229
1987	12	—	1531	123	1666
1988	41	—	296	140	477
1989	22	—	31	101	154
1990	23	—	22	86	131
1991	10	—	14	31	55

Note: For explanations on statistics, refer to the text under the heading *Inquiries Instituted* in Part III.
Source: Same as under Table 1.

Inquiries Disposed Of by Order

Here we give two types of statistics. The first type relates to the number of inquiries disposed of by cease and desist order and consent order [Section 37 (1) and (2)], and otherwise. Since these statistics are a follow-up of the statistics on the inquiries instituted, the possibilities of more than one party and of more than one RTP being in the inquiry exist here also.

Whether the inquiry is disposed of by cease and desist or consent order is of no substantive significance since in either case the commission's order is based on its opinion that the RTP is prejudicial to public interest. We have therefore, grouped these two types of order.

The group of inquiries disposed of otherwise is a coat of many colours. Against such inquiries, our source mentions various words or phrases the distinction among which, to us, is not quite clear, such as closed, terminated, withdrawn, dropped, notice of inquiry discharged, no order under 37(1), etc. It is, therefore, difficult to be specific, and we were compelled to group these cases under the head 'otherwise'. One thing, however, is clear, namely, that cease and desist or consent order [Section 37(1) or 37(2)] was not passed in these inquiries. To offer some speculations of a positive kind: The otherwise inquiries include RTP not established, RTP not found prejudicial to public interest, RTP approved/authorised by government, and government being/becoming a party in the inquiry. These and possibly some other reasons could be unearthed only if one has an access to the complete proceedings of these inquiries. But even if one is able to trace the records of over 3,000 inquiries disposed of by the commission, it is a huge task, involving a lot of more time, more funds and more manpower assistance than what could be mustered for this study. We have, therefore, to rest content here with only a two-fold division of the disposed of inquiries—those found prejudicial to public interest with cease and desist or consent order, and others.

A point was mentioned earlier that there could be more than one party and more than one RTP in an inquiry. It is not clear how in such cases 'the nature of order' is recorded in the source. We understand that in multi-RTP inquiries even if there is a finding of prejudice against even one, but no such finding on other RTP in that inquiry and the cease and desist or consent order passed only for that, it will be recorded as that order for the inquiry. Similarly, of the several parties in the inquiry, if RTP of only one party are found to be prejudicial to public interest, and cease and desist or consent order passed on that party, it will be recorded as that order for the inquiry. If our understanding is correct, then these statistics do not reflect properly the types of RTP found prejudicial to public interest, and the number of parties involved in such practices. Relative to the realities on this score, our statistics, therefore, overstate the number of RTP found prejudicial to public interest, and the number of parties involved in such practices.

Types of RTP in Inquiries Disposed Of by Order

While the appendices on inquiries instituted and those pending disposal given in our source, mention the type of RTP alleged, the appendix on inquiries disposed of does not mention the same. However, on the basis of the inquiry number given there, one can trace the type of RTP inquired into and against which order is passed by referring to the appendix on the inquiries instituted or on the inquiries pending disposal given in reports of the related years. Such a tracing, as we have done, proved to be a time-consuming exercise, as it involved going back in several cases to the reports of up to the previous four/five years.

We have classified RTP in 11 categories[18] listed in Table 6. Along with the RTP, we have also mentioned the section of the act under which the agreement on that practice is classified. The information on the type of RTP given in the source is not always uniformly reported either in the same annual report or in the reports of different years. In such cases, we had to use our judgment in classifying these practices in terms of Table 6. Further, some of the seemingly same or similar RTP have been put under one head. Finally, to highlight the widely known and the widely adopted practices, the less known and scantily practiced RTP were grouped under the category of 'others', along with such other practices which for various reasons could not be properly labelled.

A point was made earlier that an inquiry may be related to more than one RTP, and that in such cases even if there is a cease and desist or a consent order against that practice, but no such other order against other RTP, it will be recorded as that order against the inquiry. This limitation is with us here also. Thus, even when one or more of the many practices have been subject to cease and desist or consent order, other practices also in that inquiry against which no such orders have been passed are classified as under such orders. Thus, here also, our statistics tend to overstate the magnitude of RTP found prejudicial to public interest.

Reference was made earlier to the manner in which the statistics on RTP in the cases disposed of have been culled to form Table 6. In view of large efforts involved in such to and fro exercises, we have restricted the statistical analysis of practices in the inquiries disposed to the last 10 years, 1982-91. Among the other reasons for not covering the earlier period are the following. First, of the 3033 inquiries disposed of by the commission during 1972-91, as many as 2707 or about 90 per cent were disposed of during 1982-91. The balance of 10 per cent left out is thus small. Second, the tracing of RTP from the previous reports for the inquiries disposed of during the earlier years is a far more difficult task, as the reports for the years 1972 through 1977 do not mention the inquiry numbers for the inquiries disposed of, as is done in the later reports.

Table 5: Number of Restrictive Trade Practices Inquiries Disposed Of, 1972-91

Inquiries/Years (1)	1972-81 (2)	1982-91 (3)	1972-91 (4)
A Instituted under section 10(a)(i) and disposed of:			
1 Under section 37(1) or 37(2)	9 (69)	14 (13)	23 (19)
2 Otherwise	4 (31)	91 (87)	95 (81)
3 Total	13(100)	105(100)	118(100)
B Instituted under section 10(a)(ii) and disposed of:			
1 Under section 37(1) or 37(2)	—	1 (50)	1 (50)
2 Otherwise	—	1 (50)	1 (50)
3 Total	—	2(100)	2 (50)
C Instituted under section 10(a)(iii) and disposed of:			
1 Under section 37(1) or 37(2)	98 (79)	681 (36)	779 (39)
2 Otherwise	26 (21)	1209 (64)	1235 (61)
3 Total	124(100)	1890(100)	2014(100)
D Instituted under section 10(a)(iv) and disposed of:			
1 Under section 37(1) or 37(2)	150 (79)	172 (24)	322 (36)
2 Otherwise	39 (21)	538 (76)	577 (64)
3 Total	189(100)	710(100)	899(100)
E All: Instituted under section 10(a) and disposed of			
1 Under section 37(1) or 37(2)	257 (79)	868 (32)	1125 (37)
2 Otherwise	69 (21)	1839 (68)	1908 (63)
3 Total	326(100)	2707(100)	3033(100)

(1) Figures in brackets are percentages.
(2) For explanations on statistics, refer to the text under the heading *Inquiries Disposed Of by Order* in Part III.
Source: Same as under Table 1.

Finally, the statistics of inquiries disposed of during 1972-76 by the type of RTP and the order thereon for the period 1972-1976 which cover six of the 10 years left out by us are readily available in a tabular form elsewhere.[17] We have, however, not used these statistics as they seem to be based on the full proceedings before the commission, whereas our statistics are based on just the orders as recorded in the annual reports. So a mix-up of those relatively good statistics with our statistics in a comparative form would not have been consistent, and therefore, improper from that angle.

It is against these limitations that the statistics of the next part have to be appreciated.

IV
Statistical Analysis

We now go to the statistics proper. As noted in the previous part, they relate to agreements, inquiries instituted and inquiries disposed of, all related to RTP, and cover the period from the commencement of the Act to 1991.

Registration of Agreement

Table 1 gives the number of agreements registered and filed during and at the end of the year for the years 1973-1989.

The number of agreements filed during the year varied from the lowest of 111 in 1989 to the highest of 7310 in 1985. The number filed as at the end of year increased from 13969 in 1973 to 38985 in 1989 showing an increase of 2.8 times. The yearwise increase in the number at the end of the year varied from 0.1 per cent in 1989 to 24 per cent in 1974.

The number of agreements registered during the year varied from the lowest of 107 in 1988 to the highest of 7129 in 1985. The number registered as at the end of the year increased from 12926 in 1973 to 37788 in 1989 showing an increase of 2.9 times. The yearwise increase in the number at the end of the year varied from 0.3 per cent in 1989 to 20.4 per cent in 1974.

Thus, the trends and the magnitudes in the numbers filed and registered are broadly similar.

It is difficult to account satisfactorily for all of the yearwise changes. However, for some groups of nearby years, some explanations can be offered. First, the large increases of the early years (1974 to 1977) are due to the large response one generally gets in such matters after the act becomes operational when the parties rush to register the existing agreements. Similarly, the small increases of the latter years (1986-89) could be partly because most of the agreements that needed to be registered may already have been registered earlier, and also because having seen the working of the act generally against such agreements, only a few agreements would be entered into by the parties. The reason for changes for intermediate years is of a different kind. The rates of increase are small for the period 1978-83 but are substantial for the years 1984 and 1985. Earlier, before the judgement of the Supreme Court in the TELCO case[18], the MRTP Commission's view on registrable agreements was that all agreements specified in Section 33(1)(a) to (l) are statutory illustrations of RTP and, therefore, to be registered *per se*. In that case, the Supreme Court took the view, that this was not a correct interpretation of the law. The correct interpretation was to put the agreement under the test of Section 2(o) which was couched in terms of restriction on competition. The implication of this judgment was that sufficiency test of restriction of competition was to be applied to every agreement for registration purpose, including the agreements specified under Section 33(1). Following this judgment, several parties seem to have taken the view that in the light of this judgment, their agreements were not registrable and, therefore, they may not have filed their agreements for registration. In fact, in several inquiries that followed this judgment, the commission had to ask the complainants to provide further and better particulars to establish the existence of RTP.

The poor filing/registration of agreements continued up to 1983. By the 1984 amendment, all agreements falling within the categories specified under Section 33(1) were deemed to be restrictive of competition and therefore to be registered *per se*.[19] As a result, there was a big jump in the number of agreements filed/registered in 1984 and 1985.

Agreements in Force

These agreements are supposed to be determined one way or the other in response to the inquiries based on them. With the passage of time, some of them get determined and some may become infructuous. So the more important thing is to know the number of agreements in force at a point of time. Here, the available statistics are limited to the period 1979 to 1984. It will be seen from Table 2 that the number of agreements in force increased from 6289 in 1984 to 11678 in 1989. Relative to the number of agreements registered, the number in force increased continuously from 28 per cent in 1979 to 42 per cent in 1984.

Inquiries Instituted

We now examine the statistics on the number of RTP instituted by different parties under the relevant sections. Table 4 gives the number of inquiries initiated yearwise from 1972 to 1991, and Table 3 summarises these statistics aggregately and by the two 10-year periods.

During the 20-year period, only two inquiries were instituted upon references from government [10(a)(ii)], and both by the

Table 6: Type of Restrictive Trade Practices in the Inquiries Disposed Of by Order, 1982-1991

Restrictive Trade Practices/Section (1)	Number of Inquiries: U/S 37 (1) (2) (2)	Otherwise (3)	Total (4)
1 Collective price fixation/parallel pricing, etc [33 (1) (d)]	36 (2.7) (46)	43 (2.1) (54)	79 (2.3) (100)
2 Collective bidding/tendering [33 (1) (b)]	4 (0.3) (21)	15 (0.7) (79)	19 (0.6) (100)
3 Discriminatory dealings [33 (1) (e)]	304 (22.9) (75)	104 (5.0) (25)	408 (11.9) (100)
4 Exclusive dealings [33 (1) (c)]	132 (9.9) (58)	95 (4.6) (42)	227 (6.6) (100)
5 Manipulation of price/conditions of delivery, etc [2 (0) (ii)]	105 (7.9) (29)	253 (12.1) (71)	358 (10.5) (100)
6 Predatory pricing [33 (1) (j)]	2 (0.2) (11)	16 (0.8) (89)	18 (0.5) (100)
7 Resale price maintenance [33 (1) (f)]	179 (13.5) (23)	588 (28.2) (77)	767 (22.5) (100)
8 Restrictions on persons/boycott, refusal to deal/supply [33 (1) (a) (i) (ja)]	116 (8.7) (55)	95 (4.6) (45)	211 (6.2) (100)
9 Territorial restrictions/withholding of supply [33 (1) (g)]	258 (19.4) (63)	150 (7.2) (37)	408 (11.9) (100)
10 Tie-up/full-line forcing [33 (1) (b)]	162 (12.2) (20)	658 (31.5) (80)	820 (24.0) (100)
11 Others (33 (1) (b) (k) (1), 2 (0), 2 (4), vague, general, no information, etc	30 (2.6) (30)	70 (3.4) (70)	100 (2.9) (100)
12 Total	1328 (100) (39)	2087 (100) (61)	3415 (100) (100)

Notes: (1) Figures in brackets to the right of the numbers are percentages to the total against item 12, and those under the numbers are percentages to the total in column (4).

(2) For explanations on statistics, refer to the text under the heading *Types of RTP in the Inquiries Disposed Of by Order* in Part III.

Source: Same as under Table 1.

central government. The inquiries initiated on the basis of a complaint from trade/consumer associations or consumers [10(a)(i)] while more numerous than in the previous case were only a few. Of the total of 3474 inquiries instituted, this source accounted for 171 or 5 per cent of the total. The principal burden of instituting inquiries has fallen on the Director-General [10(a)(iii)] who had initiated 2186 or 63 per cent of the total inquiries. The commission [10(a)(iv)] was a distant second, with 1115 or 32 per cent of the total.

As between the Director-General and the commission, the latter's role was substantially more than the former's during 1972-81 with 57 and 39 per cent of the total inquiries instituted during this period. The position during 1982-91 was otherwise with their percentages of 29 and 66 in that order.

The yearwise details of Table 4 show clearly the impact of the Supreme Court judgment in the TELCO case, 1977 referred to earlier in this part. Following that judgment, the complainants were expected to give better and further particulars as evidence on the existence of RTP. As a result, more time was needed for preparing the case. So, the total number of inquiries instituted between 1977 and 1984 when the act was amended in the relevant portions, fell drastically from 97 and 90 in 1975 and 1976 to betwen 20 to 52 during 1977-1983. But after the 1984 amendment, the number increased again. The total number was 155, 133, 229, 154 and 131 in 1984, 1985, 1986, 1989 and 1990 respectively.

We are unable to account for the small number of 55 in 1991. But the very large number of the total of 1666 inquiries in 1987 and to a less extent of 477 in 1988 is principally due to an unusually large number of inquiries instituted by the Director-General. These numbers increased from a low of 63 in 1986, and their shares in the total number of inquiries in 1987 and 1988 were 92 and 62 per cent respectively.

Of the 1531 inquiries instituted by the Director-General in 1987, nearly 850 were against parties in two groups of products, namely (i) drugs and pharmaceuticals, and (ii) vanaspati, bakery products, refined oil and soap, with roughly an equal number in each. The RTP alleged in the former was full-line forcing and in the latter resale price maintenance. The other three product groups to which a substantial number of inquiries related were (i) LPG, (ii) V-belts and engineering products, and (iii) automobiles and spare parts, though the numbers in each case here were much less than in the two previous groups. The allegations in the inquiries in the first of these three groups related to tie-up sales, in the second to discriminating dealings/resale price maintenance, and in the third to restriction on persons/territorial restrictions and discriminatory dealings.

Of the 296 inquiries in 1988, 60 related to V-belts and to discriminatory dealings in them. The other activities which accounted for a substantial number of inquiries were, (i) automobiles and spare parts, and (ii) drugs and pharmaceuticals. The RTPs in the inquiries of the former activity were, in general, territorial restriction, tie-up sales and exclusive dealings, and in the latter resale price maintenance; discri-minatory dealings, and territorial restrictions.

Inquiries Disposed Of by Order

We now take up the statistics on the number of inquiries disposed of. Here, we give a two-fold group: (i) inquiries found prejudicial to public interest, and therefore under cease and desist or consent order [37(1)(2)]; and (ii) other inquiries. Of the total 3033 inquiries disposed of during 1972-91, as is seen from Table 5, 1125 or 37 per cent were in the first group, and 1908 or 63 per cent in the second. Relative to these percentages, the first decade had a higher percentage in the first group (79 per cent), and the second decade had a higher percentage in the second group (68 per cent).

Of the two inquiries originating from government [10(a)(ii)] during the twenty-year period, one each was disposed of under consent ordes and otherwise. A majority of inquiries under the other three sources were disposed of otherwise—forming 81, 61 and 64 per cent of the total number of inquiries instituted upon references from the trade/consumer association, etc, the Director-General and the commission [10(a)(i), (iii)] and (iv)] respectively. In each of these three cases, the proportion of inquiries disposed of under cease/desist or consent order was higher during the first decade than during the second—69 and 13 per cent, 79 and 36

Table 7: Draft Proforma for the Inquiries Disposed Of under the MRTP Act for the Period 1.1.1993 to 31.12.1993

Inquiry No	Name of the Respondent	Date of Institution of Inquiry	Product	RTP Alleged	Gateways Pleaded	Date of Disposal	Disposed Of under 37 (1) (a) (b)/ 37 (2)	Otherwise	Remarks
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
1 5/90	ABC	3.9.90	P1	33(1) (e)	—	10.6.93	37 (2)	—	—
2 31/91	1 MNP 2 RST	5.2.91	P2	1 33 (1) (f)	38 (1) (a)	18.7.93	—	1 38 (1) (a) passed	—
				2 i) 33 (1) (f)	38 (1) (a)		—	2 i) 38 (1) (a) passed	—
				ii) 33 (1) (l)	—			ii) RTP not found	—
3 14/92	XYZ	6.6.92	P3	1 Manipulation of prices	—	9.9.93		1 RTP not found	—
				2 33 (1) (b)	38 (1) (f)		2 37 (1) (a)		—
				3 33 (1) (d)	38 (1) (h)			3 38 (1) (h) passed	—
				4 33 (1) (e)			4 37 (2)		—

Notes: (1) The details under the columns are for illustrative purposes only. They are not related to the actual inquiries.

(2) As mentioned in the text, the information under columns (5), (6), (8) and (9) may be given in terms of section numbers. The contents of these sections may be briefly specified in the footnote to the table. Thus, for example, 33 (1) (e)—column (5)—is RTP of discriminatory dealing; 38 (1) (a)—column (6)— is gateway of injury to the public; and 37 (2)—column (8)—is consent order. Information that cannot be classified in terms of sections can be described in words, such as RTP of manipulation of prices in inquiry No 14/92, column (5).

(3) The advantage of this proforma is that it relates the nature of order, to the parties and to the RTPs. Thus, for example, in inquiry 31/91, there were two parties; MNP and RST. The RTP alleged against MNP was that covered under 33 (1) (f); the party pleaded the gateway covered under 38 (1) (a); the commission accepted the pleading—it did not found that RTP prejudicial to public interest, and therefore did not declare the same to be illegal. The RTP alleged against RST were those covered under 33 (1) (f) and 33 (1) (l); the party pleaded the gateway covered under 38 (1) (a) for 33 (1) (f) and pleaded that 33 (1) (l) was not RTP; the commission accepted both the pleadings, and therefore did not pass orders under 37 (1) or 37 (2).

per cent and 79 and 24 per cent. To put it differently, the percentage of inquiries disposed of otherwise was higher during the second decade than during the first in each of these cases—87 and 31 per cent, 64 and 21 per cent and 76 and 21 per cent respectively. Both of the inquiries sponsored by government were in the second decade.[20]

Inquiries Disposed Of by Type of RTP and Order

For reasons discussed in Part III, this discussion is restricted to the inquiries disposed of during 1982-91. The number of such inquiries as noted from Table 5 was 2707. The RTP alleged in these inquiries have been grouped, as explained in Part III, in eleven categories listed in Table 5.

Tie-up/full-line forcing was found in the largest number of inquiries, 820 or 24 per cent of the total. Resale price maintenance was a close second, found in 767 or 23 per cent of the total. Next in strength were discriminatory dealings, territorial restrictions/withholding supply and manipulation of prices/of conditions of delivery, occurring in 408, 408 and 358 or 12, 12 and 11 per cent of the total inquiries. Thus, the first two practices were found in a little under one-half of the total inquiries, and these five in a little over four-fifths of the total inquiries. The percentage in the remaining RTPs varied from 0.5 in predatory pricing to 6.6 in exclusive dealing.

RTP-wise, the analysis by order shows significant differences. Thus, for example, discriminatory dealing was found in the largest number in the inquiries disposed of under cease/desist or consent order [Section 37(1)(2)], in 304 or 23 per cent of the total of 1,328 such inquiries, whereas in the inquiries disposed of otherwise, its number was 104 or 5 per cent of the total of such inquiries. Resale price maintenance is the other case of such a difference, being found in 14 per cent of the inquiries disposed of under the cease and desist order or consent order and in 28 per cent in other inquiries. Two other such practices were territorial restriction/withholding of supplies with 19 and 7 per cent, and tie-up/full-line forcing with 12 and 32 per cent of the total inquiries in the respective groups.

These statistics permit us to answer another question also. How do the proportions of inquiries disposed of under cease and desist and consent orders on the one hand and other inquiries vary by practice? Of the eleven categories of RTP listed in Table 6, in seven, inquiries disposed of otherwise form a majority in the respective totals of inquiries in these practices, varying from 54 per cent in collective price fixation to 89 per cent in predatory pricing. The other five practices in this company are collective bidding/tendering (79 per cent), manipulation of prices/of conditions of delivery (71 per cent), resale price maintenance (77 per cent), tie-up/full-line forcing (80 per cent) and others (70 per cent).

In the remaining four RTP, the inquiries disposed of under cease and desist order and consent order are in the majority—with 75 per cent in discriminatory dealing, 58 per cent in exclusive dealing, 55 per cent in restrictions on persons, etc, and 63 per cent in territorial restrictions/withholding of supply.

It should be further observed that in three of the above four practices, excepting discriminatory dealing, the difference in favour of cease and desist and consent orders is small, within 13 per cent. On the other hand, such a small difference in favour of other inquiries is found only in one of seven RTP where they had a majority, namely, collective price fixation.

The number of inquiries in which prejudice to public interest was found in their RTP during 1972-91, and the number of RTP against which such prejudice was found in the inquiries during 1982-91 were each relatively small, nearly two-fifths of the respective totals. The large balance of over three-fifths in each leaves in one's mind a feeling of unease, and provokes a number of questions whose answers have to be sought from further investigations. These questions and related issues are taken up in the next part.

V
Agenda for Further Work

This final part is comprised of five different types of item. The first suggests a change in the preamble of the MRTP Act, and the second a change in the proforma for presenting the information on the inquiries disposed of. The third item draws attention to the long time taken in the disposal of the inquiries since their institution in a large number of inquiries, and suggests a probe into the reasons thereof. The fourth item lists the specific studies for improving our knowledge on this subject. They relate to the composition of inquiries disposed of, impact of control, and general effect on the public interest of certain RTP as such as also in relation to some products/services. This part is concluded with a comment on the switchover to the *per se* approach from the rule-of-reason approach advocated by some authors on this subject.

(1) *Preamble*

The Preamble to the MRTP Act has become dated because of two major developments since the enactment in 1969. It suffers from one omission and one commission. The 1984 amendment has incorporated the provisions on Unfair Trade Practices, and the reference to the same does not figure in the Preamble. The 1991 amendment has repealed almost all the provisions on the (aggregate) concentration, and yet the reference to the same continues in it. A change of, or in, the Preamble is, therefore, due. Herewith is a draft for consideration: "An Act to provide for the control of monopolies and for the prohibition of monopolistic, restrictive and unfair trade practices which are or which may be prejudicial to public interest (or which have or may have the effect of producing common detriment), and for matters connected therewith and incidental thereto. If, however, for some reason such as that by virtue of it being specifically mentioned in the Constitution (in Article 39-C), the word 'concentration' ought to be there in the preamble of the MRTP Act, we suggest that it be properly specified in the Preamble to reflect the spirit of recent changes in policy, and this can be done by specifying that 'concentration' is in the 'productwise concentration' context. Accordingly, the alternative draft of the Preamble would be as under: "An Act to provide for the control of productwise concentration and of monopolies and for the prohibition of monopolistic, restrictive and unfair trade practices which are or which may be prejudicial to public interest (or which have or may have the effect of producing common detriment), and for matters connected therewith and incidental thereto."

Table 8: Inquiries Disposed Of by Time Taken since Their Institution, 1982 and 1991

Number of Months	1982		1991	
	Number	Percentage	Number	Percentage
(1)	(2)	(3)	(4)	(5)
Less than 3	12	28.6	8	2.7
3-6	4	9.5	8	2.7
6-12	6	14.3	27	9.1
12-24	8	19.0	29	9.8
24-36	5	11.9	60	20.3
36-48	5	11.9	71	24.0
48-60	1	2.4	82	27.7
60 and above	1	2.4	11	3.7
Total	42	100.0	296	100.0

Source: Same as under Table 1, 1982 and 1991 reports.

(2) *Proforma for Inquiries Disposed Of*

As we have described in detail earlier (in Part III, under the heading Statistics and their Limitations) the nature of statistics used in this study, that description will not bear repetition here. We, therefore, restrict in what follows to offering suggestions for improvement in the presentation of statistics with further and better particulars on this topic. Also, since our principal concern has been with the statistics on the inquiries disposed of, the suggestions are by and large limited to the related proforma.

The statistics on the inquiries disposed of are presented in four appendices, one on each: inquiries instituted under section 10(a)(i), 10(a)(ii), 10(a)(iii) and 10(a)(iv), i e, at the instance of consumers, etc, central/state government, Director-General and the commission itself. The statistics may continue to be presented separately for each category as done presently.

The information given in these appendices relates to six items: (i) name of the party, (ii) inquiry number, (iii) date of institution of inquiry, (iv) products covered, (v) date of disposal, and (vi) nature of order. Presentation of information on items (ii), (iii), (iv) and (v) is by and large all right. Our suggestions relate to item (i), item (vi) the insertion of two new columns on RTP alleged and gateways pleaded, and to presenting the related information in a manner which makes it more meaningful than what it is at present. We believe that this can be done without much extra effort, as the information is already available.

Although the name of the respondents in the inquiry is given, it is not clear whether it is the sole or the first named party. It is suggested that the names of all the respondents should be given in the proforma.

Second, the information on the nature of order as presently given leaves a lot to be desired. It is presented under varying degrees of specificity, and even when the contents of the order are the same, different nomenclatures are used. Thus, for example, the order may be listed as under 37(1), without specifying whether it is under 37(1)(a) or 37(1)(b) or under 37(1)(a) and (b). Or the order may be listed as order 37(2) or consent order. The position in regard to the inquiries disposed of otherwise is worse. They are reported as closed, withdrawn, terminated, notice of inquiry disposed and the like. One would like to know the details on the orders on these inquiries. Why that particular outcome: Was RTP not established? If established, was it not found prejudicial to public interest? If so, through which gateway/s did RTP pass? Other reasons in this category include: stay order by Supreme Court/high courts, government becoming a party, agreement approved/authorised by government, agreement/practice, expired/abandoned, subsequently, etc. It is, therefore, suggested that for the inquiries found prejudicial to public interest, nature of order should be specifically indicated and the same nomenclature may be used for conveying the same contents. For the other inquiries disposed of, the reasons for the absence of such an order should be specified in the terms listed above and as illustrated in Table 7.

Our third suggestion relates to the insertion of two new columns in the present forms: one on the RTP inquired into, and the other on gateways pleaded.

As mentioned earlier (in Part III, under the heading Statistics and their Limitations), the appendix on inquiries disposed of does not give information on RTP inquired into. If, therefore, one wants to know the nature of order against RTP indulged in, one has to trace them from the appendices on the inquiries instituted/pending disposal. Our Table 6 is the outcome of that effort.

If, therefore, the appendix on the inquiries disposed of has an additional column on RTP alleged, it would enable one to know from the same appendix the cases RTP inquired into and the order thereon.

The listing of RTP as presently done under the other two appendices on the inquiries instituted and the inquires pending disposal leaves much to be desired. It is not clear whether the list relates to all or to a limited number of RTP, as at some places the word, etc, is given after the last-named party. Also, some times RTP are listed generally such as "Acting in Concert". One cannot be sure whether this practice relates to price-fixation or output restriction or to any other specific practice, singly or jointly. Further, different nomenclatures are used to denote what seem to be the same RTP, for example, fixing prices in concert, price-fixation in concert, joint-price fixation, etc. The listing of RTP in the appendix on the inquiries disposed of, as also in the other two appendices on the inquiries instituted and the inquiries pending disposal, should therefore list all RTP, list them specifically and use the same nomenclature for the same RTP.

In early part under this heading, we have given the suggestion on giving further and better particulars on the nature of order, on the lines indicated therein. Related to that suggestion is the suggestion of inserting a column on 'gateways' pleaded for the RTP under inquiry. This would enable us to know the outcome on that pleading from one place. Here again, the same nomenclature should be used to denote the pleading on the same/similar ground.

As to the terminology of the nomenclature, one could use either brief headings or indicate the same in terms of the relevant sections/sub-sections of the MRTP Act. We prefer the latter for two reasons: they label the same/similar situations without ambiguity; they make for saving of space in presentation. The broad contents of the sections/sub-sections may be explained briefly in a footnote to the appendix.

To sum up: the statistics on the inquiries disposed of as they are presented in the related appendix have a limited value for a variety of reasons given above. All they convey clearly is whether there was a finding of prejudice to public interest against the sole/the first-named party engaged in the supply of products/service specified. The presentation of statistics in a manner suggested above would enable one to know from that appendix the details on the categories of RTP inquired into, on the nature of order and on the names of all parties as such and in relation to one another of these items. A draft of the proforma based on these suggestions is given in Table 7. A study based on this information could yield useful lessons for changes in the MRTP Act.

(3) *Time Taken*

While some inquiries have been disposed of expeditiously by the commission, time taken in the disposal of a large number has been truly long. We illustrate this point by giving statistics of time taken in the inquiries disposed of in 1982 and 1991 since their institution. Table 8 gives these data. Of the 296 inquiries disposed of in 1991, time taken in 224 or 76 per cent was two years or more. The numbers and percentages in 2-3, 3-4, 4-5 and 5 years or more were 60, 71, 82 and 11 or 20, 24, 28 and 4 per cent respectively. The longest time recorded in case of one inquiry was 7 years, 2 months and 3 days.

The situation seems to have deteriorated over time. Of the 42 inquiries disposed of in 1982, time taken in 12 or 29 per cent of the total was 2 years or more as against the corresponding percentage of 76 in 1991 as noted above.

Why such a long time in such a large number later? And how can it be reduced to a reasonable limit? There is clearly a need for a diagnostic and prescriptive study.

(4) *Studies*

(a) Composition of Inquiries Disposed of: The statistics of Tables 5 and 6 leave one with a feeling of much unease. The number of inquiries and the number of RTP therein found prejudicial to public interest are each small relative to the respective numbers in the inquiries and the RTPs found otherwise. This is more true for the second decade than for the first one.

There is no doubt that this group of inquiries/practices includes numbers in which there was good evidence, and yet the commission concluded contrarily in the sense that there were no RTP, or when they were, they were not prejudicial to public interest. But the total numbers of inquiries and

practices in these 'otherwise' cases are truly large, and even when these numbers are discounted by deducting the above-mentioned numbers, the balance is likely to remain substantial, so that there is no room for complacency. It is, therefore, essential to know the break-up of the inquiries/practices disposed of otherwise in a more meaningful way, such as RTP not found, RTP not found prejudicial to public interest, having passed through the specified gateways and also the balancing test, inquiry withdrawn because of change in circumstances such as expiry of agreement, agreement approved by government, government take-over of the company, etc. If the information on the inquiries disposed of is presented in the proforma suggested in Table 7, it would be possible to know meaningfully the composition of inquiries disposed of.

In the context of the relatively large numbers in the inquiries/practices disposed of otherwise, we raise a number of questions. Is the law as it is, so very rigid that the required evidence to prove the allegation is not capable of being put together? Is the material in evidence put up before the commission so weak that it does not pass the muster? Do the authorities have adequate and competent staff to collect the needed material and prepare a good case? These questions are important not merely because the relative numbers here are large, but especially because they are so in seven of the 11 RTP categories, as noted from Table 6.

We need detailed studies to answer these questions. These studies will have to be based on the proceedings of the inquiries disposed of. The studies should first sort out the nature of findings/orders of these inquiries by the commission, and then examine critically the reasons thereof as given in the proceedings, supplemented by the inquiries from other quarters, namely, legal profession, business circles, etc.

(b) Impact of Control: The legality of RTP is determined with the touchstone of public interest defined broadly as consumers' welfare. Competition is a means to that end. So if a RTP has or may have the effect of reducing competition, it is presumed to be illegal. It may, however, be permitted if on balance the harm caused by reduction of competition is outweighed by the advantages gained in terms specified under the gateways [38(1)].

In general, when the commission declares RTP to be illegal, the implication is that the discontinuance of the RTP promotes or may promote competition in the trade/industry concerned. Has this really happened?

This is a question which has to be examined with reference to the companies/trades/industries, comparing the conditions when restrictions were practised and when they were given up. Has the abandonment of RTP improved the efficiency of the companies/trades/industries affected by the change? The differential performance in efficiency may be measured on various well known financial, economic and technical measures. To put the point specifically in terms of consumers' welfare: Have the prices of affected products/services fallen or their quality improved, or have the new products been put in the market afterwards, following the abandonment of RTP? How much of these improvements can be attributed to the abandonment of RTP, and how much to other favourable factors? If in spite of abandonments, efficiency has not improved or consumers' welfare not increased, what are the factors that counteracted that tendency?

If, on the other hand, the commission has not found RTP to be prejudicial to public interest on one or more gateways and also on a balancing test, their continuance serves one or the other purposes specified in 'gateways' [38(1)]. So here, the questions to be addressed are: Have these purposes been subserved by RTP afterwords? To illustrate with reference to some gateways: Have the exports increased? Has employment grown? Have the consumers benefited substantially in specific ways?

It is really from the answers to these and related questions that one can form a more informed judgment on the efficacy of control on RTP under the MRTP Act, and can get clues on the lines of change in the legislation.

(c) General Effects on the Public Interest: It was noted from Table 6 that of the 11 categories of RTP, a majority of RTP in four categories (namely, discriminating dealings, exclusive dealings, restrictions on persons, etc, and territorial restrictions/withholding of supplies) in the inquiries disposed of were found to be prejudicial to public interest. It may therefore be worthwhile to investigate whether these RTP in general are or may be prejudicial to public interest. And if the investigation yields a positive answer, it may be considered whether the law on these RTP should be tilted towards a *per se* approach, permitting a limited number of exemptions/exceptions as is presently the case with respect of RPM. Later, on availability of further and better evidence, other RTP may be similarly investigated.

A cursory examination of RTP declared illegal by type of product/service shows that certain types of RTP may be found more frequently in some products/services than others. Thus, for example, sale of a machine or a consumer durable like refrigerator is often tied up with the condition of installation and the demonstration of its operation at the purchaser's place, and the price of the product is inclusive of the cost of these services. Or as was the case earlier before the MRTP Commission's orders, LPG dealers used to give the gas connection to the customers on the condition of purchase of stove from them. A third example relates to the supply of consumer products by a manufacturer to the dealer on the condition that the latter will resell them only at a price stipulated by the former.

Such productwise investigations may help spot out product-RTP links. They may examine whether such specific product-RTP attachments in general are or may be prejudicial to public interest. In the light of these studies, it may be considered whether there is a case for tilting the law in favour of *per se* approach to such RTP when found prevailing in certain products/ services as suggested above.

Such studies would be of great value in forming judgments on the question of change in the MRTP Act. The issues on which judgments need to be formed are: Are the present provisions in respect of various RTP all right? If a change is needed, should it be selective or all-embracing? If selective, in which RTP and in which products/services and in what direction? If all embracing, should there be a basic change in the approach to the MRTP Act from the rule-of-reason to the *per se*?

The British Monopolies Commission has carried out a number of investigations on the general effect on the public interest of a number of RTP, and also insofar as they prevail in relation to the supply of goods/services.[21] No such study has been carried out by the Indian MRTP Commission. Attention may be drawn here to Section 61 of the MRTP Act under which the central government is empowered to ask the commission to submit such reports. This power has not yet been exercised. It is time to exercise it.

(5) *Per Se Approach*

As we have discussed generally the relative merits and disadvantages of the rule-of-reason and the *per se* approaches at the end of Section III, we discuss here only the particular arguments made by the advocates of change in the basic approach—from the rule-of-reason to the *per se* in the MRTP Act, the reference to which was made in Section I.

In brief, these arguments are two-fold: (a) The British and the Indian experiences show a very large proportion of RTP found prejudicial to public interest. (b) The rule-of-reason approach is unfair. It is only when the commission has inquired into RTP and declared them to be illegal that they are abandoned. RTP not enquired into even when they are alike the former may continue to be practised. Why, therefore, continue with a time-consuming, expensive and unfair (rule-of-reason) approach, and not change to the other approach (*per se*)?

On a close examination, we find these arguments not appealing. As to the first point,

the British experience may or may not be relevant. This experience has to be examined in detail, and its relevance to the Indian conditions has to be shown for a serious consideration of this argument. To the best of our knowledge, there is no such study, and views and opinions based on impressions or cursory studies should not be regarded seriously, especially when one is considering a fundamental change of the approach itself.

As regards Indian evidence, A N Oza's data of the 275 inquiries disposed by the commission during 1970-79, show that 200 or 73 per cent were found to be (wholly) prejudicial to public interest with the follow-up of cease and desist or consent order, and 75 or 27 per cent were disposed of otherwise.[22] This evidence must be juxtaposed against the other evidence presented in this paper, and when done so, the picture looks considerably less favourable. As Table 5 has shown, in only a third of the total inquiries disposed of during 1982-91 was there a finding of prejudice to public interest; and in view of the preponderance of the number of inquiries disposed of during this period relative to the earlier period (1972-81, which is also covered in that table), the percentage for the entire period is pretty close to that for the earlier period, 37 and 32 per cent respectively. The finding by RTP in the inquiries disposed of during 1982-91 tells a similar tale. A finding of prejudice was only against 39 per cent of RTP in these inquiries. All in all, the Indian evidence cannot be taken as supporting satisfactorily the proposal of such a major change in the approach.

The second point on fairness has no doubt some merit. But it must be put in a proper perspective. The case for change must be based on a balance of net advantage arrived at on a full consideration of relative merits/disadvantages of the two approaches—the felt ones under the rule-of-reason approach and the expected ones under the *per se* approach, and not just on the ground of unfairness patent in the former. But until this is done, the rule-of-reason approach should continue, and steps should be taken to mitigate the unfairness. Here, the remedy lies in preparing the cases to be put before the commission well and early, and the commission disposing them of expeditiously. It is perhaps not possible to do so under the present set-up. So the set-up must be strengthened and enlarged. The director-general and the MRTP Commission should be equipped with more staff, with better expertise and experience in the branches of knowledge required for their work. The number of members of the MRTP Commission should be suitably increased, the commission should sit in benches, and these benches should be located at three/four places. So far the commission has been having only three or four members and has been sitting as a whole and only in Delhi. The strengthening proposed here is all the more necessary now, as since the early 80s the work-load has increased due to increase in the number of RTP inquiries and also due to the inquiries into the Unfair Trade Practices which have been brought within the purview of the act. So, if such a strengthening is not done, the number of agreements and inquiries of agreements and inquiries pending disposal will increase, and the feeling of unfairness will not only persist, but will get accentuated.

All in all, the available evidence on, and the known arguments for a change in favour of, the *per se* approach at present are not sufficiently pursuasive. Knowledge of the Indian conditions in this area is limited and tentative. A well-informed judgment on the question of change in the approach to the MRTP legislation will, therefore, have to be formed later after we get the light from the studies referred to above.

Notes

[This study is based on a research project carried out in the Industrial Policy Management Group of Indian Institute of Management, Ahmedabad. The Research and Publications Committee of the Institute provided the seed money for the project. Thanks are due to the committee, the group and the institute for financial support. I am grateful to my colleagues in the institute for their help in various ways: to A N Oza, G S Gupta and D N Sen Gupta for their interest and encouragement, to S Bakshi and H Keshava for statistical assistance and to C J Varughese for secretarial help. This work could not have been continued and completed without the extensive help of C Achuthan, joint secretary, ministry of law, government of India. He guided me in the legal aspects, made available the relevant literature, introduced me to his colleagues, and commented upon the draft. My debt to him is thus immense. My grateful thanks are also due to T V S Panduranga Sarma, director-general of investigation and registration, for discussion at the early stage of this investigation and for offering suggestions/comments on the draft, and to P L Sanjiva Reddy, secretary and Nand Lal, director (Research), both of the MRTP Commission for giving the needed facilities for work in the commission's office/library and for sparing time for discussions. Finally, I am thankful to M R Kolhatkar, member, Central Administrative Tribunal for his suggestions on the draft. These friends share the merits of this work, but I alone am responsible for the blemishes which the reader may find in this study.]

13 The following quotations bear this out. The first and the third quotations are from administrative reports of the Monopolies and Restrictive Trade Practices Commission for the years 1973 and 1975 and the second is from the report of its administration department, Department of Company Affairs of the Government of India for the year 1974.

(i) "The Commission has drawn the attention of Government in its last Annual Report to the declining number of references received by the Commission under Chapter III... It appears that about 10 per cent of the applications received under Chapter III of the MRTP Act have been referred to the Commission up to now... The Commission has ... observed that a number of cases of large magnitude and importance to the economy were decided by the Central Government without reference to the Commission... The Commission is not able to understand the policy which is being pursued in this respect. The Commission cannot help feeling that there is some incongruity in that some times cases not involving any major issues are referred to the Commission while others, which would *prima facie* involve important considerations, are not so referred" (Part II, Chapter V, p 87).

(ii) "In order to remove certain misconceptions about the objectives of this important legislation (MRTP Act) in certain quarters, it is necessary to reiterate what the then Minister had stated (Lok Sabha Debates, 17-9-1969, p 415), while piloting the Monopolies and Restrictive Trade Practices Bill in Parliament with regard to the purpose sought to be achieved by the legislation.

"I would like to reiterate once again that as far as the basic goal of the industrial policy of the Government is concerned and which goal this government wishes to pursue, it is the goal that we must work for achieving an accelerated growth both of industry and economy. While this shall be our pursuit, at the same time, one cannot be oblivious to the socio-economic objectives... I must emphasise that the aim of this legislation is certainly not to inhibit industrial growth in any manner, but only to ensure that such growth, that does and must take place, is chanellised for the common good and is not used to increase and perpetuate concentration of wealth and economic power in the hands of a few business groups or those who are enjoying privileged positions arising out of product monopolies and semi-monopolies" (Part I, Chapter I, p 2).

(iii) "The observations of the Department of Company Affairs in the 4th Annual Report on the working of the Monopolies and Restrictive Trade Practices Act, 1969 for the year, 1974 (a sample of which is given above) indicate that the number of references under Chapter III is going to be very few in future... it appears that the Commission will have little role to play in the matter of checking of the concentration of economic power ..." (Part II, Chapter V, pp 73-74).

14 Government of India, Ministry of Law, Justice and Company Affairs, Department of Company Affairs, *Report of the High-Powered Expert Committee on Companies and MRTP Acts*, New Delhi, 1978.

15 A shortlist of such books will be found in note 1.

16 For want of space, we do not give here the meanings and explanations, and advantages and detriment to the consumers' welfare of these and other restrictive trade practices, and rest content by drawing attention of the reader to the references. See, among others, Russell, G Warren, *Anti-Trust in Theory and Practice*, Grid, Inc, 1975 (Sections IV and V); Roger Alan Boner and Reinald Krueger, *The Basics of Anti-Trust Policy*, The World Bank, Washington, DC 1991 (Ch IV); Verma (Ch VI) and Singh (Ch V, Pt A), both cited in note 1. The last two references will be of particular value for understanding these practices in the Indian context.

17 S M Dugar (1976), cited in note 1, pp iii-lxiv.

18 In the Supreme Court of India, Civil Appeal No 1147 (NCM) of 1975, Tata Engineering and Locomotive Company (TELCO) v/s The Registrar of Restrictive Trade Agreement, New Delhi: Decision, January 21, 1977, quoted in Mittal, cited in note 1, Vol III, pp 449-59. In fact, in several inquiries that followed this judgment, the commission had to ask the complainants to provide further and better particulars to establish the existence of RTP.

19 Section 33(1) as per the 1984 amendment reads as under: "Every agreement falling within one or more of the following categories shall be deemed, for the purposes of this Act to be an agreement relating to restrictive trade practices, and shall be subject to registration in accordance with the provisions of this chapter, namely...".

The earlier version of 33(1) was: "Any agreement relating to a restrictive trade practice falling within one or more of the following categories shall be subject to registration in accordance with the provisions of this chapter, namely...".

20 The feature of a small percentage of inquiries disposed of under cease and desist or consent order relative to the inquiries disposed of otherwise seems to be common to other types of similar legislations also. For example, of the total 10,359 cases disposed of during 1991-92 (November-October) by 14 Consumer Dispute Redressal Forums of Kerala, 4,713 or 45 per cent went in favour of consumers and 5,646 or 55 per cent were rejected or otherwise disposed of. *Vide*, Lizzy, E A, 'Consumer Redressal Agencies: How Effective? Kerala Experience', *Economic and Political Weekly*, Bombay, August 7-14, 1993, p 1637, Table 2.

21 See, for example, The Monopolies and Restrictive Trade Practices Commission, *Collective Discrimination* (1955, reprinted 1972); and The Monopolies Commission, *Recommended Resale Prices* (1969). *Refusal to Supply (1970); A Report on the General Effect on the Public Interest of Certain Restrictive Practice So Far as They Prevail in Relation to the Supply of Professional Services*, Part 1: *The Report (1970); Cross-Channel Car Ferry Services: A Report on the Supply of Certain Cross-Channel Car Ferry Services* (1974), all by Her Majesty's Stationery Office, London.

22 A N Oza, cited in footnote 2, pp 912-993, Table 24.2. The breakdown of 75 inquiries disposed of otherwise was: not prejudicial, wholly or partly to public interest (10), no RTP (2), withdrawn (12), orders contested (25) and no data (26).

Politics of a By-Election

Nakodar and Ajnala Assembly Constituencies in Punjab

P S Verma

The results of the by-elections to two assembly constituencies in Punjab, Nakodar and Ajnala, have far-reaching implications for politics in the state. This article examines the dynamics of electoral politics in the two assembly constituencies against the background of economic changes which have taken place there.

BY-ELECTIONS in a democratic polity are significant pointers to the stresses and strains of the infrastructure as also to fluctuations in party alignments and fortunes. This article seeks to examine the dynamics of electoral politics in the two assembly constituencies of Punjab out of which the voters in one (i e, Nakodar) allowed the ruling party to retain its hold but in the other (i e, Ajnala) the seat was wrested from it by the Akali Dal (Badal). In Nakodar too, the difference between the Congress and the Akali candidate was only of 5,210 votes. Whereas in the Ajnala seat the Akali candidate, trounced his Congress(I) opponent by a sizeable margin of 10,314 votes. This obviously shocked the ruling party which has a huge election machinery and resources at its command. Besides, the ruling party has had a free run ever since it came to power in February 1992. The major Akali factions not only boycotted the February 1992 assembly polls but also failed to emerge from the shadows of a militant stricken state to become a formidable rival in the municipal and panchayat elections. Likewise in the Jullundur parliamentary by-election (May 1993) they had failed to pose any serious challenge to the Congress(I) which trounced the Akali Dal (Badal) by a big margin of 1,15,984 votes. Even in the Nakodar assembly segment of the parliamentary seat the Congress candidate's lead in the parliamentary poll was as high as 13,459 votes.

The Ajnala defeat of the Congress(I) seems to have heralded an Akali revival and put the ruling party on the defensive. How could that happen and why did the Congress(I) candidate fail to retain the constituency? Also how could the opposition candidate not only stage a come back but could defeat the ruling party in a short period of two years and three months? An effort to answer these questions should incidentally provide an insight into the process of rejection and acceptance of a party by the electorate, emerging trends of inter-party electoral adjustments and the patterns of political polarisation and hopes and fears of the ruling party in view of its declining image in the state in which even the return of peace has not yet wiped out fears of the people about the recurrence of violence, the government assertions notwithstanding.

In Ajnala, the by-election was caused by the death of Harcharan Singh Ajnala, speaker of the Punjab Vidhan Sabha, while the election of Umrao Singh, who represented Nakodar constituency in the state legislature, to the Lok Sabha from Jullundur on May 19, 1993 caused the by-election in Nakodar. These by-elections provided an opportunity for both the major parties to test their popularity among the people in the Doaba (lying between Sutlej and Beas rivers and consisting of Jullundur, Hoshiarpur and Kapurthala districts) and Majha (lying between Beas and Ravi rivers consisting of Amritsar and Gurdaspur districts) regions of the state. Doaba has been a traditional stronghold of the Congress Party. Unlike the Majha and Malwa (lying on the left bank of river Sutlej consisting of the districts of Ferozepur, Ludhiana, Ropar, Anandpur Saheb, Patiala, Sangrur, Bhatinda, Moga and Faridkot) regions, Doaba is dominated by the Hindus and scheduled castes. In Majha too, the Congress Party, prior to the state's reorganisation in 1966, had held an edge over its rivals. But in the post-reorganisation period the Akalis have surpassed Congress in the Sikh-dominated areas. Both these regions have a sizeable urban population and are dominated by the small and middle farmers in the countryside. The Malwa region on the other hand is dominated by the middle and large landholders who have also established their supremacy in the Akali Dal in particular and the 'panthic' politics in general. Owing to the increasing hold of the Akalis on the dominant jat Sikh peasantry, the base of the Congress Party or, for that matter, most other groups in the countryside has faced a considerable erosion.

Further, with the onset of green revolution and state's reorganisation, the electoral base of the Congress Party has shifted to and got concentrated in the areas dominated by the Hindus and scheduled castes. The Doaba region including the Nakodar assembly seat entails a big chunk of Hindu and scheduled castes population. Roughly speaking, about 34 per cent of the electors in Nakodar belong to the scheduled castes, 20 per cent Hindus, 38 per cent Jat-Sikhs, 5 per cent ramgarhia Sikhs, 2 per cent kumhars and 1 per cent Christians and others. Whereas in the Ajnala assembly constituency, which falls in the Sikh-dominated Majha region, the social complexion of voters is made up of 46 per cent jat-Sikhs, 14.24 per cent majhbi Sikhs, 12.65 per cent Christians, 12.25 per cent rai Sikhs, 7.91 per cent Hindus and 4 per cent balmikis, sansis and harijans. Jat-Sikhs happen to be most decisive in this constituency. The Hindus and scheduled castes form around one-fourth of the total electors. The Akalis consider Ajnala as a 'panthic' constituency as 90 per cent of its voters come from the rural areas. It has only two small towns named Ajnala and Ramdass with only 11,000 and 6,000 voters respectively. There is only one sugar factory in the entire constituency which was founded during the tenure of the former speaker, late Harcharan Singh Ajnala. Most areas of the constituency are flood-prone and have invariably faced the fury of the Ravi river and an adjoining 'Sakki nalla'. In addition, a series of villages bordering Pakistan have no link roads and adequate sources of passenger transport. Likewise there exists hardly any adequate power supply in the different parts of the constituency.

Strangely enough, most of the rai Sikh peasants (small and marginal farmers) along the border have yet to acquire permanent ownership rights as a part of the land which they cultivate is leased out to them on a 'patta' (contract) basis. There exist about 9,000 acres of land in the constituency which has been allotted on the 'patta' basis. It has also made them vulnerable to frequent exploitation by the state functionaries including the revenue officials. A major chunk of the agricultural land in the constituency is owned by the prosperous jat-Sikh peasants. The Christians, Majhbis, Sansis, etc, generally form the group of landless labourers. During the terrorist violence it was one of the worst affected areas in which class I militants including

Satnam Singh Changiada, Malkiat Singh Ajnala, Chhina, etc, ruled the root. Many Hindus had to migrate to the towns for safety; some even sold their property assets (land and houses) to the jat-Sikh peasants. In addition to the farm income, many people near the border earn from smuggling and other related activities. All these factors had a close bearing on the electoral politics in the constituency.

Nakodar in comparison to Ajnala tends to be better developed in both agriculture and industry. Around 26 per cent population of the constituency lives in the urban areas. In the towns of Nakodar and Goraya the industrial activity, mainly under the stewardship of the flourishing Ramgarhia businessmen, has taken firm roots. Like the other urban areas of the state, both the towns are Hindu-dominated and jointly command around 25.47 per cent voters of the constituency. The location of the Goraya town on the G T road has also given it a big boost in terms of economic development. The countryside is dominated by the medium and small size jat-Sikh farmers. The people often face the fury of Sutlej in the rainy season. Brick kilns and local carpet manufacturing are the other economic activities in the area. Many people on account of being small landholders have gone abroad to earn their livelihood from time to time. According to some rough estimates around four-five per cent people from this area have gone to various countries.

The Akali Dal's support structure in this area usually confines to the jat-Sikh peasantry whereas the Congress(I) has its traditional strongholds among the Hindus, scheduled castes, ramgarhias, etc. As the Congress Party has also often nominated jat-Sikh candidates, it has obviously attracted a section of the jat-Sikh candidates, it has obviously attracted a section of the jat-Sikh peasantry in most elections.

A look at the political complexion of the Nakodar constituency shows that the Congress has dominated it since independence. In all there have been 12 assembly elections, including the two by-elections held on July 31, 1955 and May 26, 1994, out of which the Congress Party has won as many as eight elections. In addition, a rebel Congress candidate also won twice in 1967 and 1969. The Akalis have won only once in 1985 when the Congress(I) had participated in the assembly elections in a reluctant manner. The general impression in 1985 was that the Congress wanted to handover power to Akalis so that they would tackle the problem of terrorism on their own. However, in the July 1955 assembly by-elections the CPI nominee, Harkishan Singh Surjit (general secretary CPM), trounced the Congress candidate by securing 55.5 per cent valid votes cast in the constituency. The communists in the initial years were in fact a force to reckon with in this area. Many pockets of Doaba had been under the influence of the left in the past.

In the post-independence period too, the CPI-led 'anti-betterment levy' movement (1958-59) received a maximum support of the peasants in this belt. Moreover, the Nakodar assembly constituency happens to be the native place of some top communist stalwarts like Harkishan Singh Surjit, G S Randhawa and Rajinder Singh Sarinh. Though there is a sizeable population of the scheduled castes in this constituency, the organisations like Scheduled Castes Federation, DS-4, BSP, etc have hardly received encouraging response so far. Similarly, BJS/BJP has never been able to impress upon the Hindu voters. Unlike many other areas, this constituency has been averse to fundamentalist forces. It has had the privilege of being represented by leaders of the stature of Sardar Swaran Singh, Harikishan Singh Surjit and Darbara Singh. Sardar Swaran Singh was born in a vilage called Shanker, which is also the native place of some other important political leaders of Punjab like Balbir Singh, Chaudhary Darshan Singh, Joginder Pal Pande, Rakesh Pande, etc. As regards electoral politics, Table 1 provides data about the party position during the preceding assembly elections in the Nakodar seat.

In the case of Ajnala it is a sort of hybrid politics that has grown under the influence of communists, Akalis and the Congress Party. The first two elections in 1952 and 1957 were won by the Communist Party of India. Achhar Singh Chhina, a known and fiery communist, won both the times. In the first general election he humbled the Akali Dal as well as the Congress Party. Whereas in the second, the contest was between the communist and the Congress candidate. The Akali Dal did not contest and supported the communist nominee. It kept on supporting the communists till 1977. However, the communists could win only in 1967. The Congress on the other hand captured the seat in 1969 and 1972. In the case of 1967 it was an atmosphere of 'anti-Congressism' that favoured the CPI(M) stalwart, Dalip Singh Tapiala, to win the Ajnala seat. In 1977, the Akali Dal itself contested in alliance with the CPI(M) and wrested the seat from the Congress Party with a margin of 2,036 votes. In the subsequent election (1980) the Congress candidate, Harcharan Singh Ajnala, defeated the Akali nominee, Shishpal Singh with a margin of 3,441 votes. However, in the post-Blue Star period, i e, in the 1985 assembly polls, the Akali candidate again wrested the seat from the Congress Party by a big margin of 18,958 votes. The CPI(M) this time instead of supporting Akalis had contested separately but failed to secure more than 3,952 votes in all. It was for the first time that the CPI(M) had opposed the Akali Dal in the Ajnala seat. What a fall in the CPI(M)'s support? In the 1950s and 1960s the communists under the stewardship of comrade Sohan Singh Josh, Achhar Singh Chhina, Fauja Singh Bhullar, Dalip Singh Tapiala, etc, were a force to reckon with in this region. The growing pace of communal polarisation and opportunistic alliances by the communists themselves have reduced them to a marginal point. The electoral performance of different parties in the Ajnala assembly seat may further be seen from Table 2.

Nomination Politics, 1994

Originally, both the by-elections were scheduled to be held on May 26, 1994 but subsequently in the case of Ajnala the Election Commission postponed it to August 27, 1994. The ground was that the state government had violated the model code of conduct by announcing the intention to include 'dalit' Christians in the scheduled caste category. The Akalis perceived postponement of election to be the ruling party's strategy to evade defeat at the

Table 1: Partywise Performance in Past Elections

Year	Assembly Seats	Per Cent of Valid Votes Polled	Congress	Akali Dal	BJS/BJP	Communists
1951-52	2	56.06	45.03	19.67	8.58	10.06
1955	1	44.11	39.40	–	–	55.5
1957	2	50.49	56.28	–	5.07	12.68
1962	1	54.27	56.50	23.36	–	–

1977	1	67.25	41.50	39.13	–	–
1980	1	67.01	49.66	48.45	–	–
1985	1	72.79	40.75	41.88	–	6.52
1992	1	23.16	50.62	–	10.41	–

Source: The data have been compiled from the Election Commission Reports.

hands of their candidate. They thus termed the Commission's decision as "a murder of democracy". The criticism of postponement added a new strength to the Akali Dal in Ajnala. However, the Congress also criticised the decision and challenged it in the court. Three writ petitions were filed by the Punjab government, the Congress candidate and the Akali Dal (Badal) nominee. The government and the Congress nominee denied the violation of the model code of conduct while the Akali Dal (Badal) candidate alleged that the Congress got the election postponed in the arbitrary manner because it feared defeat in the wake of rampant corruption, price rise and violation of human rights. Consequently the Election Commission in view of the Supreme Court's decision agreed to hold the by-election on May 31, 1994.

Regarding nominations, the Congress(I) nominated Amarjit Singh Samra for the Nakodar seat and Major Rajbir Singh for Ajnala. Both of them belong to the jat-Sikh community. Samra was holding the chairmanship of the Punjab Markfed. In the past he had been elected to the positions of panch, sarpanch and chairman of the Block Samiti. Traditionally, he represented an agriculturist family but presently his major sources of income include transport, financing and business. He is known financier and owner of the famous 'Prince' transport in Jullundur. His family relations cut across party lines. He is related to another big transporter, owner of the 'libra' transport, who is affiliated with the Akali Dal. Samra's son filed his nomination papers as a covering candidate. The owner of Dhiman enterprise, Gurbachan Singh Dhiman, a leading Ramgarhia industrialist of the Nakodar area, was also an aspirant of the Congress ticket but failed to get the party nomination. Initially he was non-committal but gradually started supporting Samra. The Ramgarhia community is concentrated in some pockets of Goraya and Nakodar town. Another very serious aspirant was Surinder Singh Babla, president of Jullundur District Youth Congress (rural), who played a key role in getting the Congress(I) candidate Umrao Singh elected to the Lok Sabha in 1993. Not only did he fund the campaign but also led the campaign with scores of his supporters. Senior leaders admit that it was because of him that the Congress got a wide margin in the Nakodar segment of the parliamentary constituency.[1] However, he was denied the nomination because of feud between the All-India Youth Congress president, Maninderjit Singh Bitta, and the chief minister Beant Singh. Darbara Singh, thrice MLA and speaker of Punjab Vidhan Sabha, was also ignored. Umrao Singh, who had vacated the seat after his election to the Lok Sabha seat from Jullundur, was also keen to get Congress nomination for his son, Amarjit Singh. But he lost the race. The Congress working committee's resolution that the practice of giving the party ticket to relatives of party leaders should be discouraged was also used as an excuse for denying nomination to his son. Umrao Singh, as a result, became lukewarm. In fact, he had fielded two rebel candidates who, however, had withdrawn from the contest.[2] The Congress(I), unlike the parliamentary-poll (1993), was thus divided and "plagued with internal dissensions". Though the chief minister succeeded in bringing these leaders to the fold of campaigning, some of their supporters including sarpanches and municipal members still remained lukewarm.

In Ajnala, the Congress(I) nominated major Rajbir Singh, Ajnala (retired), son of the former Punjab Vidhan Sabha speaker, late Harcharan Singh Ajnala, whose death caused the by-poll in the constituency. His younger brother, Har Pratap Singh filed as the covering candidate. Major Ajnala belongs to a leading family of jat-Sikhs. Not only that his father represented this constituency thrice and became speaker of the Punjab Vidhan Sabha but it is also a family of prosperous agriculturists having family relations with other leading agriculturist families of the area. His family has rice shellers and some partnership in business at Meerakot near Amritsar. The chief minister was initially interested in giving party ticket to a local businessman, Rajbir Singh Ravi, a youth Congress leader from Ramdas town, but ultimately agreed to nominate major Ajnala. Ravi and his supporters remained considerably lukewarm in their approach. He had considerable influence in about 50 border villages. However, the dissidence was managed by the chief minister and most party workers supported the party nominee.

As regards the Akali Dal (Badal), Parkash Singh Badal had a free hand in nominating the party candidate at both places. In Nakodar he nominated Kuldeep Singh Wadala, senior vice-president of his party. His two sons filed as his covering candidates. Wadala's family happens to be a leading agriculturist family of the area. His close relatives in some other villages of the constituency also wield considerable political influence. He was elected to the Punjab Vidhan Sabha in 1985 from the Nakodar seat by defeating his first cousin Umrao Singh of the Congress(I). However, he lost to Umrao Singh in the Jullundur parliamentary by-poll in 1993. In the case of Ajnala seat, Badal nominated Rattan Singh, president of the district party (rural) unit and once MLA in 1985 and who is a famous medico running a private clinic along with his wife in Ajnala town. He also belongs to a jat-Sikh family and happens to be financially well off. Among the other serious Akali aspirants were Mohan Singh Mattian and Sardul Singh Dhariwal. Badal tried to persuade but his efforts failed to rope in Sardul Singh who remained in the fray till the last and polled 1,075 votes, all of these would have gone to Rattan Singh of the Akali Dal (Badal). The newly formed United Akali Dal (Amritsar) had rendered some indirect help to Sardul Singh. However, none of the top leader (Tohra, Barnala, Mann, etc) of the Akali Dal (Amritsar) came to the constituency in support of Sardul Singh. This provided a good opportunity to the Akali Dal (Badal) candidate in ascertaining maximum support of the Sikhs for being the only serious 'panthic' nominee in the election fray. Besides, the other opposition groups such as CPI(M), Bharatiya Kisan Union, BJP, etc, also extended full support to the Badal group in Ajnala. The Congress(I) in this seat had faced the united opposition whereas in Nakodar there was hardly any emphatic announcement by the BJP in support of Kuldeep Singh Wadala. Moreover, Wadala's image among the Hindus during the militancy was of a hardliner. Many people said that he had often spoken the language of the militants. The Congress(I) exploited it to the hilt. Besides this, the CPI(M) candidate, a jat-Sikh and economically well-to do person who had been to England for years, contested the by-poll in Nakodar. His presence in the fray cut into the Akali votes.

TABLE 2: PARTYWISE PERFORMANCE IN PAST ELECTIONS

Year	Assembly Seats	Per Cent of Valid Votes Polled	Congress	Akali Dal	BJS/BJP	Communists
1951-52	1	58.74	29.43	32.55	–	32.88

1992	1	10.27	75.89	–	12.47	–

Source: The data have been compiled from the Election Commission Reports.

In brief, the strategy of nomination of candidates in the case of both the major parties was of selecting known political figures and financially well-off persons belonging to the jat-Sikh community, a dominant caste in both the assembly constituencies. Moreover, the most decisive factor in selecting party nominees was not the organisation but personality of the two leaders, viz, Beant Singh and Parkash Singh Badal.

The Campaign

Once the formal nominations were announced, the campaign got momentum. Both the major parties got together a large number of party workers and hectic campaigning was launched. The Congress Party had both vertical and horizontal arrangements to support its candidates in the two assembly seats. The campaign was mounted by a virtual army of local, district and state level leaders who enjoyed a strong infrastructure of automobiles, posters, leaflets, pamphlets and party flags. Caste and community leaders were called upon to campaign for the party candidates. Both the constituencies were divided into zones by making groups of five to eight villages which were put under the direct charge of ministers who were further helped by the legislators, sarpanches and other workers. Keeping in view T N Seshan's diktats, the ministers and other leaders used private cars with party flags each escorted by two police vehicles. The entire Congress ministry and the legislative elites kept on holding their positions till the last day. The chief minister, Beant Singh, reached every corner of the two constituencies and moved along with dozens of cars packed with ministers, MLAs and other leaders.

The Akali Dal candidates leaned heavily on the charisma of Parkash Singh Badal who had joined the battle with full enthusiasm and worked round-the-clock till the polling was over. He undertook trips to the remotest areas of the two constituencies, held rallies, public meetings and discussions with the groups of voters and party workers. He was helped by the other opposition groups and his own party workers, many of them were brought from the Malwa region, a bastion of Akali politics. Most Akali workers representing the middle and younger age category worked strictly under the directions of their leader. The Akali Dal had no dearth of workers and resources at its command. However, it was unable to match the ruling party, particularly in terms of resources.

Interestingly enough, the decision of the newly-floated United Akali Dal (Amritsar), a conglomerate of six Akali factions led by S S Barnala, Jasmer Singh, Jagdev Singh Talwandi, Simran Jit Singh Mann, Bhai Manjit Singh, Amrinder Singh, Sukhjinder Singh, etc, to keep away from the by-elections introduced a new feature into the election campaign which changed the tone and tenor of canvassing by the Akali leaders in Ajnala and Nakodar. This needs to be briefly discussed here for purposes of knowing the new developments which determined the election strategy of the Akali Dal in the two by-elections. The rhetorical panthic propaganda combined with anti-centre, anti-Hindi, or for that matter, anti-India stances along with emotional outbursts remained absent from the election scene. There was hardly any trading of religion for political gains. The old panthic stalwarts neither participated nor made any direct appeals to the Sikh masses. The electoral politics moved away from religious domination.

This new scenario of electoral politics was mainly a result of the existing feuds and factions within the panthic politics. Certain top Akali stalwarts allegedly wanted to serve their political ends by using the Akal Takht (supreme religious-cum-temporal seat of the Sikhs) in the name of unifying the fragmented Akalis. The whole effort at achieving unity was being done in accordance with the directions of the acting jathedar of Akal Takht, Manjit Singh. The Jathedar told the leaders of various factions to perform 'seva' (religious services) in order to "purify their minds and hearts, make them humble and to accord due respect to other Sikhs in accordance with the principles of Sikhism". He also said that because of Akali factionalism the entire Sikh community had to face "traumatic situations".[3] In response to his call six panthic groups agreed to merge into the United Akali Dal aimed at waging a struggle for establishing an autonomous region within the federal structure where the Sikhs could enjoy a glow of freedom and in case of non-fulfilment of this demand, the Dal would wage a struggle for a sovereign Sikh state, which obviously sparked off sharp reactions from different corners of the country. Parkash Singh Badal dissociated his group from these unity efforts. He did so at the risk of inviting the wrath of the Sikh clergy involved in the unity drive. Instead he objected to Akal Takht's intervention in Akali politics. In a letter to the Akal Takht Jathedar on April 17, 1994 he advised him to keep Akal Takht out of power politics.

Moreover, Badal abstained from joining the United Akali Dal leaders when they jointly performed 'seva' in the Golden Temple for five days as directed by the Sikh clergy. While starting their 'seva' on April 27, 1994 they criticised Badal for turning his back towards the Akal Takht at a time when the Sikh clergy was striving to forge Akali unity in order to fulfil Sikh aspirations.[4] The Akal Takht Jathedar also deplored it by stating that the refusal of Badal to appear at Akal Takht after his commitment at Talwandi Sabo was "very unfortunate".[5] His defiance was termed as sinful by the rival Akalis. Some of them called him a traitor and stated that "those Sikhs who have no regard for Akal Takht are greater sinners than those who demolished it". Later they appealed to Akal Takht to take action against such leaders. Badal, according to G S Tohra, had posed a grave threat to the authority of Akal Takht with controversial references. Further Tohra said "whosoever come in confrontation with Akal Takht would get isolation from the Sikh Panth".[6]

In a tactical move, Badal on April 21, 1994 resigned from the presidentship of his party and set up a five-member presidium to run the party affairs. He said that it was not possible for him to run the affairs of the party because he was deeply hurt by the developments in 'panthic' politics. Sources close to him indicated that the resignation was a tactic to thwart a bid by the SGPC chief, G S Tohra, and his supporters to free Badal to appear before Akal Takht for blasphemy and get him excommunicated from the Panth for defying the call of Akal Takht.[7] Badal himself said that there were calls for his social boycott issued by the Akal Takht Jathedar at hebest of the United Akali Dal.[7b]

Badal appeared at the Akal Takht only on May 6, 1994 and had a meeting with the five Sikh high priests for over five hours. He withdrew his controversial letter written to the Akal Takht jathedar and submitted apologies for any reference that had hurt the Jathedar. He also affirmed faith in Akal Takht and its jathedar. However, he did not agree to merge his party into the United Akali Dal and claimed that the 'Singh Sahiban' had allowed the Akali Dal (Badal) to retain a separate identity.[8] According to him, unity should be based on principles and should emerge from the very core of the heart.[9] Mention may be made here that about 25,000 to 30,000 supporters of Badal had also gathered there when he arrived at the Golden Temple and Akal Takht on May 6, 1994. All this was to show that "he had not challenged the supremacy of Akal Takht but also had not accepted unity". He foiled all attempts to force him to merge his party. This made him much stronger than before and gave a severe blow to the rival Akalis. After a while on June 6, 1994 he again took over as president of the Akali Dal (Badal), a party which has since then attracted lots of senior Akali leaders, the youth Akali Dal wings and grass roots level workers. Big conventions have been held to formalise merger of the different factions with the Akali Dal headed by Parkash Singh Badal. A resolution adopted

at one of the conventions said "Unfortunately, a section of the Akali Dal stands influenced by leaders who attach more importance to their own narrow political ends and who have never hesitated in the past to sacrifice the larger interests of the Punjabis and the Sikhs to gain personal political advantage. Our commitment to the nation, panth and Punjab demands that these leaders be isolated."[10]

In the unity efforts Badal's group apprehended that it was an exercise to isolate Badal and put the United Akali Dal under the command of G S Tohra. Badal, therefore, opposed it and stuck to his stand to retain a separate identity of his own group. His victory over his rivals was appreciated in most circles and considered to be a positive development in the Akali politics in the post-militancy period. This victory also established him as the indisputed leader of the Sikh peasantry. Criticism of Akal Takht's intervention in politics and the controversial resolution of the newly founded United Akali Dal strengthened Badal's position considerably. In fact his emphasis on Hindu-Sikh unity and call for greater autonomy within the federal structure raised his stature quite high among the diverse group of people.

It was against this background that the Badal Akali Dal entered the two by-elections in Punjab. His major thrust during the course of campaigning remained on issues such as 'misrule' of ruling Congress(I), misuse of official machinery, widespread corruption, nepotism, inflation, hike in the prices, river waters, police excesses, rigging, bogus voting, unemployment and problems of employees, Hindu-Sikh unity, etc. He cited examples of Guru Teg Bahadur who had sacrificed his life for Hindus. He termed the present Congress(I) ministers as a team of corrupt people who had looted Punjab government during the past two years.[11] He asked the chief minister, Beant Singh, to quit and seek a fresh mandate because his government was "illegitimate" one as it came to power with just 10 per cent votes in 1992. Moreover, he said that the Congress government was "anti-people, anti-farmer and anti-trader" and failed on all fronts and people were fed up with it. He also appealed to the government employees not to play in the hands of the ruling party and be impartial. "This government is on its way out, do not be afraid of the ministers",[12] Badal suggested.

He had launched his party's campaign quite late as he was "entangled in the Akal Takht affairs". He, in fact, fought on two fronts. While on the one side he was facing the ruling Congress(I) and on the other onslaughts from the rival Akalis in Amritsar. Badal blamed the Congress(I) for the creation of the Punjab problem. While refuting the charge of Beant Singh that he was responsible for the rise of militancy, Badal said that "militancy was the Congress baby". Further, he maintained that had he been responsible for it "why then very senior leaders of his party had been felled by the bullets of the militants". Likewise, he refuted Beant Singh's charge of calling Akali Dal anti-national. He said that if it was so then why Beant Singh had been functioning in that party and contesting elections as Akali nominee not once but twice, Beant Singh and several of his Congress ministers, according to Badal, were 'fugitive' Akalis in the Congress Party.[13]

Apart from this, Badal blamed G S Tohra for egging on the Akali factions to boycott the elections and handing the state over to the Congress on a platter.[14] He also accused the panthic leaders of extending help to a rebel Akali candidate in Ajnala. Even the Akal Takht jathedar, reportedly, sent pamphlets "appealing to the voters to put down Badal". Badal had also alerted his party workers about the electoral malpractices by the ruling Congress. When this author met him, Badal made a pointed reference to this aspect. However, he was quite confident about the victory of his party's nominee in Ajnala. He and his colleagues were very much agitated on the misuse of official machinery by the Congress(I). His party's nominees even pleaded for the deployment of the CRPF and BSF for all poll-related works instead of Punjab police. The BJP workers also lent support to Akali Dal (Badal) because of Badal's stand before the Akal Takht jathedar.

Badal undertook hurricane tours and covered every part of the two assembly constituencies. He moved with dozens of vehicles. He and his supporters refrained from mixing religion with politics. Nor did they arouse any unnecessary fears. Regarding this it has been aptly remarked that "For the first time in many years a Sikh leader has tried to take the debate on politics from the podium of gurudwaras to the podium of public platform, a feature that distinguishes secular democracies from theocratic states".[15] It was interesting to note that the BJP distributed 'ladoos' and played 'bhangra' on the victory of the Akali Dal candidate in the Ajnala assembly constituency. The by-polls in both the constituencies were characterised by people as battles between "Badal and the Punjab government". Many viewed it as a 'Beant vs Badal contest'. The candidates hardly mattered. There were candidates other than those of the two parties but none could make their presence felt in an atmosphere charged with personalities and dominant parties. Beant Singh had also emerged as a popular leader because of his achievements on the law and order front. These achievements had already rewarded him in the municipal and panchayat elections and added considerable charisma to his personality.

Beant Singh's attack in the campaign remained concentrated around the personality of Badal. He rated Badal as a weak leader and said it was during the chief ministership of Badal that the Sutlej-Yamuna link canal dispute had originated. Badal, according to him, took Rs two crore from Devi Lal, the then chief minister of Haryana for the construction of the canal. "Later, when Mr Badal was out of power, he and other Akali leaders, including Mr Tohra, launched a morcha against construction of the canal. In fact, that was the beginning of the period of bloodshed which Punjab witnessed for more than 10 years", he said.[16] In every election meeting/rally he lashed out at the Akalis "for ruining Punjab by staking terrorism for their vested political interests". He also warned people that the Akali Dal (Badal) candidate in Nakodar had "links with militants". For this he appealed people to reject "such anti-national forces which could ruin Punjab once again". He called it as a fight between the nationalists and anti-nationalists. He also lampooned the Akalis for their infighting and remarked "they were the same whether it was the United Akali Dal or the re-united Akali Dal".[17] Further, he alleged that the Akali Dal (Badal) had supported militancy and terrorism in Punjab. Instead of condemning the killings of innocent people during a decade-long turmoil in the state, he said Parkash Singh Badal

TABLE 3: VOTES POLLED IN TWO ASSEMBLY CONSTITUENCIES (1951-52 TO 1994)

Constituencies	1951-1952	1955	1957	1962	1967	1969	1972	1977	1980	1985	1992	1994
Nakodar	56.06	44.11	50.49	54.27	62.30	73.49	69.32	67.25	67.01	72.79	23.16	68.09
Ajnala	58.74	-	64.70	68.44	64.73	72.50	72.26	70.18	70.44	61.91	10.27	72.33

TABLE 4: RESULTS AND PARTYWISE PERFORMANCE IN TWO ASSEMBLY ELECTIONS (1994)

Constituencies	Total Votes	Valid Votes Polled	Congress(I)	Akali Dal (Badal)	CPI(M)	Others (Independent, etc)
Nakodar	1,17,803	80,211 (68.09)	37,526 (46.78)	32,316 (40.29)	5,995 (7.48)	4,374 (5.45)
Ajnala	1,26,435	91,452 (72.33)	36,542 (39.96)	46,856 (51.24)	—	8,054 (8.80)

went to attend the Bhog ceremonies of the terrorists.[18] The chief minister also alleged that both Badal and Gurcharan Singh Tohra were party to the conspiracy to eliminate Sant Harcharan Singh Longowal for their vested interests.[19] While referring to the Akali Dal (Badal) and BJP alliance, Beant Singh said it was a strange case of two opposite poles meeting each other. He said perhaps the BJP people had forgotten the gory incident in Moga where 28 BJP supporters were killed by terrorists.[20] To play the militancy card, the government displayed posters of a dreaded militant of the Khalistan Commando Force in the Nakodar constituency. The police said that he was spotted in the region.[21] The chief minister claimed for the return of peace to the strife-torn state and reiterated his government's resolve to fight the separatist elements and safeguard the unity and integrity of the country. In addition he emphasised that as peace had been restored his government would now concentrate on developmental schemes and enable employment opportunities to the youth. All through the campaigning, the ruling party emphasised on its victory over terrorism, stability and establishing peoples govenmment up to the grass roots levels. The chief minister and his entourage covered every nook and corner of the two constituencies.

Both the major parties left no stone unturned in reaching the voters by making very hectic and brisk campaigning. Meetings and rallies addressed by the chief minister and Parkash Singh Badal were a key feature of the electioneering. In addition, both the major groups made very sound arrangements by dividing the constituencies into zones and putting each zone under the command of responsible and senior leaders. The Congress largely harped on the restoration of peace and criticism of Akalis about their role during militancy and the Akalis on the Congress(I)'s misrule, corruption, price rise and discrimination against Punjab and Sikhs. The Akalis, among others, also made elaborate arrangements to check electoral malpractices. Both the parties were fully equipped and saturated the assembly constituencies with their resources. Moreover, Beant Singh and Parkash Singh Badal camped in these constituencies and made these contests as their prestige points.

Voter Turnout and Poll Verdict

The intense competition between the two major rival groups resulted in a greater participation of the electorate in voting. As much as 68.09 per cent valid votes were polled in Nakodar and 72.33 in Ajnala. Comparatively the turnout was higher in the rural areas dominated by the jat-Sikh peasantry. Three villages in Ajnala recorded as high as 85 per cent polling and nine others 75 per cent.[22] The reason for a comparatively higher polling in Ajnala was mainly of its being a rural constituency. Interestingly enough, in the case of the previous assembly elections of 1992 the reverse had happened. In the rural dominated Ajnala it was only 10.27 per cent polling whereas in Nakodar it came to 23.16 per cent. Incidentally, the voters in the Sikh-dominated countryside in the 1992 assembly polls largely remained indoors and kept away from polling. It was because of this that the turnout of valid votes in the assembly poll of 1992 was lowered down to 22.82 per cent in the state. However, with the return of normalcy, the voters in the countryside of Punjab first showed a higher polling (82 per cent) in the panchayat polls in 1993 and then in the current by-elections in Ajnala and Nakodar. In the Jullundur parliamentary by-poll of May 19, 1993 too, the number of valid votes cast was 58.03 per cent. The percentage of votes in the current two by-polls tended to be as enthusiastic as ever in these two constituencies. This may further be seen from Table 3.

The relatively lower polling in Nakodar was partly because of a slightly lower turnout in the town areas where voters showed less enthusiasm than those in the villages. Another factor of a comparatively lower percentage was that lots of voters from the constituency had gone abroad.

In terms of results, the Nakodar seat, as mentioned, was retained by the Congress(I) whereas the Ajnala was wrested by the Akali Dal(Badal). The margin of victory in Nakodar came to the tune of 5,210 votes whereas in Ajnala it went as high as 10,314 votes. This shows that the victory of the Badal group in Ajnala was more spectacular than the Congress(I). Moreover, the Congress though it had retained the Nakodar seat, its performance had gone down considerably in comparison to the votes polled by the party a year ago in the Jullundur parliamentary by-poll. The total number of votes polled in the Nakodar segment during this parliamentary by-poll was 77,477 out of which the Congress(I)'s share was to the tune of 47.79 per cent whereas that of the Akali Dal (Badal) remained only 30.57 per cent. This time the number of valid votes polled in the assembly election was 80,211 (i e, 68.09 per cent of the total 1,17,803 votes in the constituency) out of which the Congress(I) got 46.78 per cent and the Badal group 40.29. This showed a decline of 1.01 per cent votes in the Congress's account and a spectacular rise of 9.72 per cent in the poll performance of Akalis. Increasing cognitive level of voters about the inefficiency and non-performance of the ruling party led to a decline in its vote percentage. The rival group seemed to have taken advantage of this and raised its tally of votes quite high. However, if compared with the previous assembly polls in Nakodar in 1985, the Congress has registered an increase of 6.03 per cent votes over its performance of 40.75 per cent in the previous election. The Akali candidate, Kuldeep Singh Wadala, this time, on the contrary, was polled 1.59 per cent less than his own score of 41.88 per cent votes in 1985. This clearly indicates that the Congress(I) has been able to make some inroads in the rural areas of Punjab. It may be mainly attributed to its recent performance on the law and order front. Had it been complemented by some developmental activities, the scenario perhaps would have been different.

Even in the case of Ajnala, though the Congress(I) in the current by-election lost to the Akali Dal with a fair margin, the score of the party candidate in comparison to the previous assembly poll in 1985 has considerably gone up. This time the score was 39.96 per cent whereas in 1985 it did not exceed 26.65 per cent. On the contrary, the Akali candidate's score of 51.24 per cent votes in 1994 has gone down considerably in comparison to 57.09 per cent in 1985. Like Nakodar, it suggests an improvement in the performance of the Congress(I) in Ajnala too. Whereas in the case of the Akali Dal its grip over the rural voters seemed to have somewhat loosened. The general impression that the recent imbroglio of violence in Punjab had totally alienated the Congress Party from the Sikh voters in the countryside does not hold good. Likewise, the talk of further consolidation of the Akalis in the villages hardly sound realistic. No doubt their hold on the Sikh peasantry tends to be far more greater than that of the Congress Party.

However, the decline in the Congress votes in about one year's time suggests many things and it needs a systematic analysis and explanation.

Factors and Implications

Of the two election results, the spectacular victory of the Akali Dal (Badal) at Ajnala, which gave a severe jolt to the Congress(I), had attracted major comments and reactions from different circles in Punjab and outside. Before analysing the major socio-economic and political factors which helped the Akalis to win the Ajnala seat, it would be quite relevant to record here the views of different political stalwarts who had participated in the electoral process in an intensive manner. Their reactions which appeared in different sources may be biased and spontaneous but were based on the keen observations which they had made about the contextual characteristics of politics in the two constituencies. Parkash Singh Badal regarded it as a turning point in the state politics and termed the victory of his party a victory in

a war against the 'unjust' and 'corrupt' Congress rule of Beant Singh. He sought the resignation of the Congress(I) government and treated his party's victory as a 'fatwa' (verdict) against the Congress rule. In a victory rally in Ajnala he said that the outcome was a verdict against the minority Beant Singh government and "an eye-opener to our Akali friends who were misusing religion for their own vested interests".[23]

In the national and local press there was a common impression that Badal had emerged as a rallying point after the poll result in Ajnala. Some have interpreted his party's victory as useful in countering two unhealthy trends in Punjab politics. One is the mindless factionalism among the Akalis. The other is the Beant Singh government's indifference to the vital need to check police high-handedness.[24] However, the rival panthic leaders belonging to the newly floated United Akali Dal did not credit Badal for his party's victory in Ajnala. They instead attributed it to the failures of Beant Singh's government. To the BJP leaders, who supported Akali Dal (Badal), the defeat of Congress(I) in Ajnala implied a public censure of political terrorism, large-scale corruption and wrong policies "of the state government".[25] Likewise, the Lakhowal group of the Bhartiya Kisan Union (BKU), an ally of Badal group, welcomed the verdict and termed it as a jolt to the Congress(I) government for its anti-Punjab policies. Sat Pal Dang, a veteran CPI leader, said "Congress again tried the peace card not realising that the same plank cannot go on paying dividends." Corruption was another major factor, according to Dang, which attributed to Congress(I)'s defeat in Ajnala.

Even some top Congress(I) leaders from Punjab (Buta Singh, etc) ascribed the Congress defeat in the Ajnala by-election to "rampant corruption, nepotism, police excesses and maladministration" in the state.[26] The chief minister, Beant Singh, neither found any substance in these factors nor agreed with the view that Badal had emerged as the most popular Akali leader after the poll results. While reiterating that his government would continue its fight against communal and separatist forces, he said that militancy would get a boost following the victory of Akali candidates.[27] He also said that the result was not unexpected. However, he maintained that it was a healthy sign that the Badal group, which boycotted the 1992 assembly poll, had opted for the democratic process. Broadly, he spelt out three main reasons for the defeat of his party candidate in Ajnala. First was the legacy of terrorism as this area had been the hotbed of terrorism. Many people in the border villages, according to him, used to indulge in anti-social activities including smuggling. These people, he felt, had not digested the return of peace and hence they opposed the Congress. Second, he said that the BJP support for the Akali candidate also contributed to the defeat of the Congress candidate. About 2,000 BJP supporters, according to him, voted for the Akali candidate. Third was the factor of the independent Christian candidate, Umar Masih, who polled 4,090 votes, which, according to him, would have otherwise gone to the ruling party. As regards factional fights in his party, he admitted that few ministers had not campaigned satisfactorily. However, he denied any cabinet reshuffle on this account.[28] The above observations and comments have some element of truth and explanatory utility but do not provide a detailed and comprehensive account about the peoples verdict.

From the social and demographic point of view, the Ajnala assembly constituency because of being a jat-Sikh dominated rural hinterland gave an obvious advantage to the Akali Dal which claimed to be the sole spokesman of the peasantry in Punjab. The Congress(I), with a majority of jat-Sikhs in the council of ministers, no doubt, made some inroads in the villages but was still not comparable with the Akalis. Like Nakodar, there was no CPI(M) candidate in Ajnala to cut into the jat-Sikh vote-bank of the Akalis. In Nakodar all the 5,995 votes polled to the CPI(M) candidate, a jat-Sikh peasant, would have otherwise gone to the Akali candidate. Besides, the phenomenon of acheduled castes in the Ajnala constituency was not very significant. The other weaker sections such as the rai Sikhs and Christians, though they had been traditional strongholds of the Congress party in the past elections, this time did not follow the earlier lines. The Christian candidate, contractor Umar Masih, cut into the Congress votes. It helped the Akali candidate in a substantial manner. As regards the rai Sikhs, the author during his visit to their villages, situated along with the Pakistan border, noticed a strong current against the ruling party. These villages (Dalla Rajput, Ballowal, Sarangdev, Khanwal, etc) not only lacked the link roads, facilities of passenger transport and other development activities but people were also harassed by the police and revenue official. Their area was inundated by the flooded Ravi during monsoons in 1993 but most villagers, as they told the author, were yet to get the relief or compensation for their crops. Whereas some resourceful persons in the constituency reportedly got reliefs without any damage to their crops and property.

Moreover, since their land was 'patta' based they were deprived from the facilities of usual loans as the bureaucrats would trap them on one account or the other. One of the village panchayat members (a rai Sikh) said that the people would not get more than a half of any amount sanctioned by the government in their names. Literacy rate is very low in these villages. The existing educational facilities for their children were also inadequate. Further, all ills including the habit of alcoholism were widespread in the area. Several people were drunk in the day time when the author visited these villages during the election period. Both the parties were using liquor to win people's votes. Incidentally in Nakodar a dalit died of excessive drinking on May 25, 1994 while partaking the poll eve feast with several others in his vilage Samra, the native village of the Congress candidate in Nakodar. He had reportedly enjoyed the hospitality of both the Congress and Akalis. Both camps had blamed each other for the incident.[29] Drinking liquor from both the major groups by several people in the villages was a common feature in both the constituencies.

Another factor regarding which most rai Sikhs and other people in the border villages felt agitated against the Congress was the factor of newly elected sarpanches of their panchayats. It was told that the Congress ministers and other leaders of the region in collusion with the police and state officials fraudulently manoeuvred the panchayat polls and elected Sarpanches of their own liking. These sarpanches instead of serving the hapless rai Sikhs and other villagers had served themselves. In some villages of rai Sikhs the onus of peoples anger against sarpanches fell on the Congress(I) candidate. While the sarpanches in these villages were supporting the Congress(I), the people were with the Akali Dal (Badal). The rai Sikhs commanded around 15,500 votes in the constituency.

Most of the voters had good image of late Harcharan Singh Ajnala but were not so happy with his sons. The younger son was even reportedly involved in the task of thrusting sarpanches on the villagers.[30] This apart the voters were dissatisfied with the deeds and behaviour of some Congress ministers, legislators and their wards. Cases of assaults by the Congress(I) leaders on teachers, cops, MLAs, doctors, etc, were made popular among the voters which also damaged the image of Congress Party and stalled the victory of its candidates. The incident of a Congressman taking out his pistol on the polling day in Nakodar and the activities of the chief minister's grandson in the elections were made important matters to beat the Congress Party in the hustings. All this was further substantiated by the employees' processions in Ajnala town demanding arrest and registration of cases against the two Congress(I) sarpanches who had beaten up a patwari in the court of the Tehsildar on May 11, 1994.[31] On the poll eve period the issues of bogus voting, rigging, etc, were made central by the Akalis. On the

polling day groups of Akali workers were deputed to keep vigil over such acts of Congressmen. At several polling booths they resented and demonstrated against bogus voting and use of force against their men. Even Parkash Singh Badal, with whom a motorcade of 14 cars was moving from one polling booth to another, had to enter into an argument with a Congress minister near a polling booth in Ajnala where the author was also watching the polling process.

A plethora of issues such as the ever-growing graph of corruption, nepotism, prices, etc, intensely affected the Congress(I)'s fortunes in Ajnala. Corruption, nepotism and prices were the key weapons used against the Congress rule. Describing these as "politically motivated" by the Congress stalwarts did not compare with the empirical reality. Nor Beant Singh's tactics of sidetracking the issue by saying that Badal had amassed huge property assets and wealth through corrupt methods had worked. He in fact claimed that the property and wealth of Badal had exceeded those owned by 84 Congress MLAs put together including the chief minister.[12]

As regards Nakodar, the victory of Congress(I), as mentioned above, may be mainly attributed to the support of Hindu, Ramgarhia and scheduled caste voters. In fact, they have been Congress's strongholds in most elections. While discussing with the voters belonging to these groups at different places like Nakodar, Goraya, Atta, Samra, Sarinh, Shanker, Sang Dhesian, Boprai, etc, it was observed that they were quite happy with the restoration of law and order by the Congress(I) government. Moreover, they did not appreciate Wadala's (the Akali candidate) participation in the 'bhog' ceremonies of the militants. The Akali Dal got only a limited support from these groups. They are yet to be seriously wooed by the Akalis. Similarly the Congress(I) attracted only a small number of jat-Sikh votes from the villages. Jat-Sikhs form a sizeable vote bank in the constituency but in the absence of any alignment with the other groups they would just ensure only a close contest, not victory. Moreover, each village or caste group besides being economically heterogeneous tends to be riven by local feuds and factions which usually determine their voting behaviour.

The presence of CPI(M) candidate also cut into the Akali votes in rural areas. The factor that Bahujan Samaj Party (BSP) of Kanshi Ram did not contest the by-elections in Punjab also went in favour of the Congress(I). Had it contested, it would have become a triangular fight between Congress, BSP and Akali Dal in which Akalis would have won the seat. The BJP workers were sounded to oppose the Congress(I) but their writ on the Hindu voters hardly run. Badal's tactics of Hindu-Sikh unity and holding the Congress responsible for driving a wedge between the two communities did work but only to a limited extent. Had his emphasis on "Punjabiat" or unity of all Punjabis not only of Sikhs and the consequent confrontation with the United Akali Dal begun somewhat earlier it would have, perhaps, attracted more Hindus to rally around his group.

However, these by-elections would have far-reaching implications for Punjab politics. The state is likely to witness significant changes including new political alignments and intra-party factional fights. Badal's victory in Ajnala may not endanger the survival of Beant Singh's government, yet it would amount to a great stress on the ruling party and its leader. There may emerge more covert opposition to Beant Singh's position in the party. Since his assuming power in February 1992 his position has been almost unassailable. The changed context, particularly outside the legislature, where there has emerged hallo round the personality of Parkash Singh Badal, seems to have made Beant Singh quite vulnerable.

The post-by-election duels between Beant Singh and Buta Singh are pointers towards this. Further fissures may develop in the Congress(I). Criticism may be built around multiple points such as Beant Singh's authoritarian handling of the party as well as government affairs, factionalism in the Youth Congress, over-representation of a particular caste or community in the ministry, growing rate of corruption, police excesses, etc. If Badal's efforts towards the unity of all non-Congress parties bring fruit it may not only endanger stability of the Congress regime in the state but also triumph the opposition in future elections. It is only by stepping up development activities, minimising corruption, strengthening unity in the party ranks, resolving long-standing issues with the centre's assistance and blocking any chance of state's sliding back to the decade-old trauma which could save the ruling party at the next hustings. The restoration of peace, though a very important achievement of Beant Singh, would not suffice beyond a point.

An important meassage from the congress's victory in Nakodar was that the party's fortunes would be safe if it continued getting support of the scheduled castes. Their proportion in the state's population happens to be as high as 26.9 per cent. Interestingly enough, in the Doaba area their proportion, according to the 1981 Census, was 32.9 per cent. More strikingly, the proportion of the scheduled castes in the Jullundur district, where the Nakodar seat falls, tends to be 36.7 per cent. The BSP of Kanshi Ram, unlike the current by-polls, will not keep away from the future elections in the state. As it may not contest separately, the alignment of this party would decide the future course of power politics in Punjab.

The Ajnala victory of the Akali Dal has elevated Badal's stature and made him a rallying point and potential contender for power in Punjab. His detractors in the Panthic politics are reduced to a non-entity. Lots of leaders and the grass roots workers of the other Akali factions have flocked to the Badal group. Whether his 'Punjabiat' and the extremely moderate postures succeed in ushering in a new era in Punjab politics remains to be seen. It is hoped that the hard-liners and others would not queer his pitch by raising complex issues. Harping on emotive panthic issues would no longer help any panthic party in the changed scenario of Punjab politics. Nor the restoration of peace alone, though a great task, without providing clean administration and fulfilling peoples expectations would bring any dividends to the ruling party.

A System of Positive Incentives to Conserve Biodiversity

Madhav Gadgil
P R Seshagiri Rao

India's current programmes for conservation of biodiversity suffer from major defects and need to be radically. restructured to meet present-day challenges, such as the conservation of the entire spectrum of biodiversity including insignificant components, and the need to integrate traditional conservation practices of local communities in new programmes.

INDIA is one of the world's top 12 megadiversity countries, with a rich tradition of as well as a vigorous modern effort at conservation of biodiversity. Yet the country's heritage of biodiversity is being rapidly eroded. This can be traced to a number of deficiencies in the current system of utilisation and conservation of biological resources that have resulted in a weakening of the traditions of prudent use of biomass and conservation of biodiversity, while failing to erect in their place other effective alternatives. The traditional community-based systems of sustainable use of village woodlots and pastures, coupled to protection to sacred plants, animals, forests or ponds have been adversely affected by the state take over of common property resources, in effect converting them into open access lands and waters, subject to unregulated overuse[1]. At the same time the state managed reserve forests have been dedicated to subsidised supplies of wood to urban-industrial consumers leading to overharvests, followed by clear-cutting and conversion to monocultures[2]. The state forest authorities in charge of vast tracts of lands and now waters as well have been indifferent to the broader considerations of biodiversity, and have permitted unregulated harvests of myriads of so-called minor forest produce, including medicinal plants. They have also clear-cut the only remaining stands of species rich climax forests surviving as sacred groves and converted them into eucalyptus plantations[3].

The state-sponsored conservation effort has focused on maintenance of wild life sanctuaries, national parks and biosphere reserves over 4 per cent of the India's land mass. The management of these protected areas has paid scant attention to conservation of the total spectrum of biodiversity, focusing on a few flagship species like tiger and their mammalian prey, neglecting important elements such as aquatic habitats, or high altitude grasslands, and removing dead and fallen wood and destroying leaf litter. Managers of protected areas have also tended to treat local tribals, peasants, herders and fishers as enemies resulting in serious difficulties such as burning of stretches of Kanha Tiger Reserve by displaced tribals[4].

To sum up, India's current programmes for conservation of biodiversity suffer from four major defects: (1) A mistaken notion that nature conservation must involve exclusion of all human use, especially subsistence use by tribal and rural populations; (2) A narrow focus on protected areas, largely forest tracts, to the neglect of biodiversity outside of nature reserves, in other reserve forest tracts, in lands in and around villages, in wetlands, rivers and seas; (3) An unfortunate emphasis on protection through use of arms by a bureaucracy, especially against local tribal and rural people; and (4) Untenable claims of availability and application of scientific knowledge while failing to put to use detailed locality specific folk ecological knowledge.

This system obviously needs to be radically restructured to meet the present day challenges as recognised, for instance, by the Convention on Biological Diversity, to which India is now a party[5]. These challenges involve: (1) Conservation of the entire spectrum of biodiversity, being concerned even with apparently insignificant organisms, be they small herbs or wood rotting fungi; and the (2) Need to respect the traditional knowledge and conservation practices of local communities, especially women, and to share with them benefits accruing from the utilisation of biodiversity. It is our purpose to discuss in this paper the lines along which such a system may be designed.

A New Paradigm

Such a system will have to be grounded in coupling sustainable use of biological resources with conservation of biodiversity, not in a few protected areas, but throughout the length and breadth of the country, driven by a series of positive incentives directed especially at the people living close to the earth. The system should concern itself with the entire landscape and waterscape of the country for two reasons. Firstly, many biodiversity elements of evident value such as wild relatives of taro and yams characteristically occur in highly disturbed habitats, others such as weedy relatives of paddy occur in low input cultivation systems. It is therefore, quite inadequate to concentrate conservation efforts merely on a few protected areas, primarily under forest biomass. Secondly, it is not feasible to protect a few islands rich in biodiversity in the midst of degraded landscapes. The biodiversity-rich islands would be far more secure if a serious attempt is made to create a biodiversity friendly, ecologically restored matrix around them.

Of particular importance in such attempts would be the uncultivated lands, forests, grazing lands, cultivated lands under low input, rainfed cultivation which still tends to be based on a number of land races of cultivated plants, and streams, rivers, coastal tracts away from areas of intensive use[6]. These habitats are extensively used by the poorer segments of the Indian community, people who depend on biomass resources gathered with their own labour from their immediate vicinity to meet their requirements of food, fuel, fodder, fibre, organic manure, medicines. Such people have few options to turn to if deprived of access to these resources. In intimate contact, day in and day out, with their environment, often rooted in it for generations, they represent the ecosystem people of the world[7]. They have a profound knowledge of the biological resources albeit of a very limited resource catchment. Such locality-specific ecological knowledge of the ecosystem people, often based on historical experience accumulated over generations could play a most useful role in sustainable use and conservation of biological resources[8]. Given the limited scientific understanding of the working of complex ecosystems, and the limited information available with professional managers, the currently prescribed, overly rigid practices could be greatly improved upon by using the detailed ecological folk knowledge of local communities to evolve more flexible, adaptive management strategies fine tuned to the nuances of local ecosystems[9,10].

Alienated from all control over their resource base, today the ecosystem people are often destroying it through unregulated overuse. However, of all the components of the Indian society, they have a larger, genuine stake in restoration and sustainable use of these resources, in their tremendous variety. They also retain some vestiges of cultural traditions of prudent use that could be revived[11]. Finally, it is these ecosystem people who are in day-to-day intimate contact with their environments and could effectively monitor the fate of its store of biodiversity.

In contrast, the people manning the state apparatus presently assigned the function of preservation of country's biodiversity, whether they bel ng to agriculture, forest, revenue or other departments, and their political masters belong to Dasmann's category of biosphere people[7]. Biosphere people have access to resources from all over India, and increasingly from other parts of the world through the market mechanisms. They have no stake in the health of any particular ecosystem, since if one locality is degraded they always have other alternatives. As a consequence, the regulatory agencies tend to deploy their powers merely to misappropriate resources, either directly or through sanctioning others to do so. Such a regime is helped by the near total lack of accountability for politicians and the bureaucracy, despite a fairly healthy democratic system, since India's grass roots level democratic institutions still remain very weak. The current centralised approach to biodiversity conservation based on regulation by an inefficient bureaucracy in league with unscrupulous politicians and business interests is therefore unworkable. It is an approach grounded in very inflexible management plans focusing on limited localities that has often proved counter-productive[12]. In its place we need to design a system of positively rewarding the ecosystem people to sustainably use and maintain, indeed restore high levels of biodiversity employing flexible management practices fine tuned to the prevalent local conditions through the length and breadth of the countryside. Such rewards could be in kind in terms of greater community rights over natural resources, in cash, or in terms of recognition of the value of folk ecological knowledge and practices of ecological prudence.

The key actors in the proposed system would have to be some appropriate community-level institutions to directly manage public lands and waters and to co-ordinate the management of private lands and waters within some appropriately defined territory. The size of the human community involved in such management should not exceed a few hundred families, so as to ensure that all members of the community are in fairly regular face to face contact. The land and water area under their management should cover part or all of their resource catchment—i e, the region from over which they regularly collect fuelwood or graze their cattle. People tend to cover a radius of 4-8 km for such activities [13], so that such a catchment would cover around 50 km to 200 km[2]. Now the population densities in rural India are of the order of 200 people per km [2,14]. So such a resource catchment will support a community of 10,000 to 40,000 people or 1,000 to 7,000 families. This is too large a number. A manageable community would be more like 40 to 200 families. This means that the territory that can be assigned to any given community would often be only a part of their current resource catchment. Such communities would then have either to concentrate their biomass harvests on much more restricted areas, or to arrive at acceptable adjustments with neighbouring communities. Such difficulties would be minimal in less densely populated forested tracts, which also tend to be richer in biodiversity.

Apart from serious difficulties thus posed by the sheer density of India's population, there are problems of the manifold divisions within the society. The Indian caste society comprises thousands of communities who largely marry within bounds of the group; the Anthropological Survey of India has identified 2,635 such communities[15]. These segments are often in highly inequitous relationships with each other, with the ownership of means of production and political power concentrated in the hands of members of a small number of the upper caste communities. Collective decision-making in such inequitous communities is fraught with difficulties. However, with increasing levels of literacy and with democratic processes taking root in the country, collective decision-making at the level of settlements and villages is becoming more and more significant. The growing importance of panchayat raj as reflected in the 73rd Amendment to the Constitution passed in 1993 is indicative of this welcome change[16].

A more difficult question is that of the role of groups on the scale of castes or tribes. Most of India's villages have populations belonging to several different castes/tribes, and most individual castes/tribes have members spread over a number of villages, often taluks or districts. The tribal organisation continues to be of importance, especially in the north-eastern hill states which are also areas of rich biodiversity[17]. Caste organisation may be especially relevant in groups like nomadic herders and specialist fisherfolk who have particularly intimate links with biological resources, and who tend to be rather isolated from the rest of the rural population[18]. Whether groups thus organised on caste or tribal lines could be fruitfully involved in a biodiversity programme, or whether the focus should exclusively be on geographically delimited settlement would require further examination.

The assembly of all adults in a geographically delimited community will in any event have to be the principal focus of the reward system to encourage maintenance of as high a level of distinctive elements of biodiversity as possible within the territory assigned to the community. Apart from gramasabha or the assembly of all adults, other community-level institutions such as youth clubs or women's clubs could play an important role in managing local biodiversity, while the local school could play a useful role in documenting it. Such community groups would have to interact with groups on other scales, for instance, individual farmers participating in *in situ* conservation of crop diversity on private land or panchayat raj institutions at the level of village clusters, and other institutions at taluk, district, state and national levels.

The working of such a system would require the support of a series of institutions to: (a) organise systems of management of both private and public lands and waters within the territory of the community in a manner conducive to sustainable utilisation of biological resources in conjunction with maintenance of as high a level of distinctive elements of biodiversity as possible; (b) set priorities, assign values in terms of significance of different elements of biodiversity for conservation effort; (c) monitor the levels of biodiversity within the territory of the hundreds of thousands of village communities of India and to assign an appropriate value to the sum total of this biodiversity; (d) decide on the share of each village community in the funds earmarked to support biodiversity conservation throughout the country in proportion to the sum total of the biodiversity maintained in the village territory; (e) disburse these funds, promptly and without any leakages to the village communities; (f) receive the funds and organise their utilisation for purposes benefiting the entire community and sharing of the rest amongst members of the village community; (g) settle any disputes in terms of shares of various village communities and individuals; and (h) settle disputes relating to regimes of management of land, water and biodiversity resources amongst members of different village communities.

The institutions proposed by us for this purpose do follow all the eight design principles of long enduring institutions enunciated by Ostrom[19]. However, they have some special features related to the fact that the intervention of the state is essential to generate additional incentives for the conservation of biodiversity.

Empowering Communities

Rewards for custodianship of biodiversity and knowledge of its use may then primarily come to a geographically defined community; though they may also go to individuals, to caste or tribal groups or to clusters of village communities. The rewards could importantly be in the form of assertion of community rights over public lands and waters within their defined territory. In theory this has been accepted under the joint forest management policy and national wasteland development board initiatives but has not been adequately translated in practice[20]. The ownership of these lands and waters may continue to be vested in the state, with neither the state nor the communities having the authority to dispose of public lands and waters, except through a jointly agreed upon decision under special circumstances. Communities could then be given full authority to manage such lands and waters in a sustainable fashion, including certain levels of biomass harvests, provided that appropriate levels of biodiversity are being maintained. With the communities standing to gain in the long run they are likely to organise sustainable use patterns for these lands and waters, and to manage them in such a way as to enhance their biodiversity value. However, it is absolutely essential that they should have adequate authority to exclude outsiders, and to regulate the harvests by group members, as well as an assurance of long-term returns from restrained use for such a system to operate effectively.

Such additional rights of access to publicly held resources would serve as a positive incentive for making prudent use of public lands and waters to meet their biomass needs. But this in itself would be inadequate to promote maintenance of high levels of distinctive elements of biodiversity within the community territory, since there may be better economic returns from monocultures, be they of high yielding crop varieties on private lands or eucalyptus on public lands. Incentives would also be necessary to compensate local communities to accept economic losses associated with maintenance of biodiversity, for instance, through crop raiding by elephants. Specific incentives which should be viewed as service charges are therefore necessary to maintain diversity, of cultivars on farm lands, of indigenous livestock breeds, of fruit trees in homesteads, of medicinal plants, wild relatives of crop plants, or troupes of primates or crocodiles on public lands and waters. Individuals or communities participating in such efforts must therefore, be paid certain rewards linked to the levels and value of biodiversity within their territory. Such rewards could be untied funds coming to the community to be devoted either to community works such as educational or health facilities, or to be shared amongst all community members. The rewards could also take the form of building community capacity for maintaining enhanced value of biodiversity within their territory, or for setting up biodiversity-based enterprises, such as chemical prospecting or extraction of active ingredients. Similar rewards may also flow for making available knowledge pertinent to uses of biodiversity, for instance in pest control[21].

Apart from these rewards, which may provide sustained positive incentives to custodians of biodiversity, there may be one time rewards such as fees for collecting some genetic resource from the territory, or fees for sharing some piece of knowledge relating to use of biodiversity. There may also be shorter term rewards such as royalties from commercial application of some element of biodiversity or some piece of knowledge relating to its use. It will, however, be very difficult to properly channelise royalties of this nature to particular individuals or communities, since this would require that every such element of biodiversity or knowledge to be traced to a particular set of localities, communities, or persons. It would then be much better to pool such royalties in a National Biodiversity Fund and use this for rewarding communities for the ongoing maintenance of biodiversity within their territories. It is important that these rewards are linked to the continuing good performance of the community in conservation of biodiversity and should be based on the annual monitoring of performance and documentation of biodiversity through a transparent open process by a neutral agency.

National Biodiversity Fund

This National Biodiversity Fund—a broader version of the Community Gene Fund as it has been termed in the context of conservation of crop genetic resources—could receive funds from many sources other than royalties that cannot be assigned to a well identified set of individuals or communities. The governments—both central and state—could deposit into it funds earmarked towards conservation efforts. The government of India should deposit into it money it may receive in recognition of its sovereign rights over biodiversity resources that are put to commercial use through the country's prior informed consent in accordance with provisions of the Convention on Biological Diversity. The government of India should also deposit into it funds it may receive from international sources such as Global Environmental Facility as incremental costs of its conservation effort. But the largest and the most consistent source for the National Biodiversity Fund could be a cess that the government of India levies on the sale of all commercial products benefiting from biodiversity: seeds of protected varieties, pharmaceuticals, cosmetics, and emerging applications of biotechnology in food processing, waste treatment, mineral leaching and so on. This would ensure that increasing volumes of funds flow into conservation efforts in step with economic growth, and in particular growth of biodiversity-based enterprises. It would also be worthwhile for the government of India to campaign for a similar cess in industrial countries becoming a source of substantial volume of guaranteed funds to meet incremental costs of biodiversity conservation in developing countries.

M S Swaminathan stresses that the entire corpus of the community gene fund should go to reward farmers for their services in the development of crop genetic resources[22]. A similar principle should apply to the National Biodiversity Fund which should be devoted entirely to rewarding village-level local communities and individuals for their contribution to ongoing maintenance of biodiversity and development of knowledge of uses of this biodiversity. None of these funds should be permitted to be diverted to support bureaucracies, for once that is accepted, Parkinson's laws would prevail and the bulk of funds would be soon consumed in unproductive expenditure, that may in the end be actually inimical to conservation of biodiversity. Of course, the administration of such a system would require help from technical and legal institutions for their effective functioning. These bodies should include representatives of people from villages/settlements involved in conservation of biodiversity along with technical and legal experts. But the government should agree to fund these institutions through a separate budget head. This would create pressures to keep this machinery lean, demanding only minimal resource inputs. That would facilitate creation of institutions geared to deliver goods in terms of biodiversity conservation, rather than committed to their own growth.

Such institutions would have to operate at all levels from the nation as a whole down to village communities with appropriate links. The national level institutions should also be linked to appropriate institutions at the global level. At the national level we require a consensus on the system of values to be assigned to different biodiversity elements, and methods of monitoring their status. India harbours tremendous biological diversity, with some 1,00,000 known species of living organisms, and another 4,00,000 or so remaining to be described, as well as high levels of within species genetic variation[23]. Evidently, we cannot deal with this entire range in the valuation and monitoring exercises and will have to deal with a sample of taxa. This sample of taxa could be so chosen as to represent different evolutionary

lineages, different biogeographic affinities, different functional roles in the ecosystem, as well as occupation of different habitats. Thus one may select, for example, freshwater algae, lichens, ferns, leguminous plants, soil nematodes, ants, snails, fish and birds as the focal taxa. Additionally, we must include in the sampling scheme elements of more evident economic importance such as cultivars of crops, breeds of domesticated animals, wild relatives of crop plants and domesticated animals, and plants and animals of medicinal importance[24]. We should then organise a system of monitoring of levels of biodiversity of such elements in the territory of each and every village, and of valuing them on an ongoing basis to firmly link rewards to actual conservation performance.

The values could be assigned on the basis of a series of principles such as the following: (a) Taxonomically more distinctive elements should be valued more; (b) Taxa with more restricted geographical ranges or narrower habitat preferences should be valued more; (c) Rarer taxa should be valued more; (d) Taxa under greater threat because of ongoing human interventions should be valued more; and (e) Taxa with greater promise of economic utility should be valued more. The application of such principles and others that may be evolved should be the function of a technically competent group. This could perhaps be a specialist group established by the central government or the Indian National Science Academy.

The system of monitoring biodiversity levels that we visualise has to cover the territory of each and every village community. Obviously this has to be launched as a massive decentralised effort mobilising the entire population. This is a great opportunity for developing a symbiotic relationship between the informal folk knowledge systems, traditional knowledge systems like ayurveda, siddha or unani medicine as well as the modern scientific knowledge[25]. A great deal of locality-specific knowledge of biodiversity elements significant to their own life-styles resides with people, many of them illiterates. This, for instance, is the case with specialist fisherfolk who know much of water bodies, ongoing changes in these water bodies and their snail, bivalve, shrimp, crab, fish fauna; or nomadic shepherds who know a great deal of large tracts of scrub savannas and grasslands and of its vegetation. This knowledge can and should be tapped to feed into the total system of biodiversity monitoring. Some pioneering attempts at documenting such knowledge have already been initiated through an organisation called Srishti. Srishti has organised a series of biodiversity contests with the help of primary schools in different states and have discovered everywhere exceptional individuals, children as well as adults who know hundreds of local species. Srishti also runs a network called Honeybee for giving due credit to and sharing such knowledge of distribution of biodiversity, as also its uses, often newly discovered by some innovators[26].

Another excellent model for decentralised inventorying is that of panchayat level resource mapping pioneered by the Centre for Earth Science Studies in Trivandrum and the science popularisation movement, Kerala Sastra Sahitya Parishat[27]. In this programme scientists work with village folk in mapping land and water elements, along with perceived problems such as gully erosion, infestation by weeds or lowering of ground water table on the village map at 1:7000 scale. These maps, and the dialogue initiated in their preparation is then expected to feed into planning of development schemes in that village area. This programme is now being made a part of the post-literacy activities as a follow up of the National Technology Mission on Literacy in other states of the country as well by an all-India network, Bharatiya Gyan Vigyan Samiti. This land, water and literacy programme could easily be broadened to include mapping of biodiversity elements within the territory of each village. Just as a technical institution, Centre for Earth Science Studies and an NGO, the Kerala Sastra Sahitya Parishat catalysed the land and water resource mapping programme, a consortium of technical institutions and NGOs, along with the country's enormous network of schools and colleges could participate in the proposed programme of mapping and annual monitoring of biodiveristy and its knowledge. A similar idea has also been floated by the Federation for Revitalisation of Local Health Traditions of preparing a community-level register of medicinal plant resources and indigenous knowledge of their use[28]. Such a register would become a component of the land-water-biodiversity mapping programme sketched above Repeated annually, these exercise could also become a central instrument of the environment education programme for the whole country.

Such data collected all over the country, employing the 14 or so official languages, perhaps also using the many local names of organisms has to be appropriately organised as a network of distributed data bases to put it to use in fostering Indian biodiversity-based enterprises as well as deciding on the proper share of the reward for its services to go to each village community. India has a vigorous enough computer science and software capabilities to meet this challenge[29]. Precautions would, of course, have to be taken to prevent manipulation of the information, as well as use of the information without adequately compensating the individuals or village communities who have generated the knowledge or helped conserve the biodiversity resources. This should be organised as a transparent, participatory process that could play a significant role in the spread of computer literacy through the length and breadth of the country.

Disbursal of the share from the National Biodiversity Fund should be a public process involving the national, state, district and village level institutions. The panchayat raj institutions and the district level machinery for planning of natural resource use, along with the village level gramasabha would all have to work co-operatively to ensure smooth operation of this process. Local schools and colleges as well as NGOs could aid in ensuring that the system is functioning as it should.

In any such system disputes are bound to arise and could take various shapes. There could be exaggerated claims of biodiversity levels by some parties. There could be questions of compensation to a village community if it loses biodiversity in course of a project benefiting others; such as providing land for a railway line. A village community may also lose biodiversity because of discharge of pollutants by another city or an industry. An appropriate system of settlement of such disputes through impartial arbitration would have to be established, along with relevant rules and procedures.

The ecosystem people of India have a rich tradition of conservation. Many of them are surviving even today albeit in an attenuated form. This is especially the case in hinterlands and tribal areas which also happen to be areas of high levels of biodiversity. Usage of wide variety of biodiversity elements is also a part of the culture of ecosystem people, as hundreds of species of plants and animals find a place in their food, in their rituals, in their systems of medicine, on their fields and in kitchen gardens and in manifold structural uses for fabricating baskets, mats, agricultural and fishing implements and so on. This intimate relationship of elements of biodiveristy with the culture of ecosystem people, now under threat from market forces should be used to full advantage in the efforts at conservation of biodiversity[30].

The convention on biological diversity rightly emphasises the need to recognise traditional knowledge, innovations and sustainable use and conservation practices of indigenous people and to equitably share with them benefits arising from any commercial application of this knowledge and these organisms. Today these practices and knowledge are often condemned as superstitious and unscientific. It is now essential that we recognise their value and encourage them in the modern day

perspective. A system of rewards which need not be material should be devised for recognising and honouring persons or communities with exceptional knowledge or achievement in this regard[21].

This entire system would require considerable inputs into development of human resources at all levels. At the grass roots levels villagers would have to be equipped into participate in land-water-biodiversity mapping, even as technical people will have to be equipped to respect folk knowledge and put it to optimal use. Biodiversity assessment and management expertise will also have to be nurtured amongst our school and college teachers and students, and in the universities and scientific institutions. Government officials, politicians and jurists would have to be exposed to the relevant information. Finally, full encouragement and adequate training—both of technical nature and in terms of receptivity to folk knowledge and practices would have to be provided to nurture a vigorous voluntary effort.

The 21st century may well turn out to be an 'era of biotechnology', already a major thrust area for commercial interests in industrial countries, with large investments in R and D and production facilities. Genetic raw material for such biotechnological processes, may come from medicinal plants, from wild relatives of cultivated plants, from local cultivars and even from currently obscure elements of biodiversity like micro-organisms, insects and lower plants. Traditional knowledge of ecosystem people regarding usage of various elements of biodiversity can offer valuable clues and insights for commercial exploitation of such resources. It is in this context that the multinational pharmaceutical company Merck has taken up biodiversity prospecting in Costa Rica with contract payment of two million dollars to the government. Several companies have already patented micro-organisms and biotechnological processes and are lobbying for patent or patent-like protection to other life forms[31].

In this scenario, India is in an advantageous position with its high levels of biodiversity, its rich store of indigenous knowledge of uses of living organisms, and its substantial scientific and technological capabilities. It therefore makes great deal of sense for the country to launch a serious effort at conservation and sustainable use of its biodiversity resources. Such an effort would succeed only if it can draw in as willing partners its masses of ecosystem people, who for millennia have served as stewards of the country's heritage of biodiversity.

[We are grateful to the ministry of environment and forests, government of India for its sustained support over the last decade.]

DISCUSSION

Idealistic Equations

Arun Kumar Patnaik

"Once upon a time a valiant fellow had the idea that men were drowned in water only because they were possessed with the idea of gravity" (K Marx, *German Ideology*).

ON reading Tejaswini Niranjana's rejoinder ('Roja Revisited', *EPW*, May 21) to Venkatesh Chakravarthy and M S S Pandian (*EPW*, March 12), I am struck by the methodological premises underlying her characterisation of "certain dominant representations of the nation, the state and the Indian middle class". This response is not a rereading of the film *Roja*. It is rather a proposal how not to delineate the contemporary representations of the nation, the state and the ruling ideas, as Niranjana does.

Niranjana enquires into the ideological processes with deep idealist premises. She equates an idea with its subject matter, a rejection of a form of the Indian state with that of its essence(s) and an instrumental use of nationalism with nationalism itself. These are errors of a fundamental type. Let me elaborate.

She suggests that the old nationalism has given way to a new nationalism which is "pro-western and is thus, by definition, anti-Muslim". But this assumption falls apart in relation to the ideological and political practices of the Nehruvian nationalism which was in a sense pro-western but not anti-Muslim. Moreover, her assumption begs a question: if Nehru's pro-western stance in the model of nationalism adopted by the Indian state following independence was not anti-Muslim, what are the elements present in the post-Nehruvian nationalism that make it both pro-western and anti-Muslim?

Niranjana argues that the Indian state or the anti-Mandal Hindu middle classes refer to an idea of the Indian nation which in its new incarnations is actually devoid of any content with respect to economic nationalism or political sovereignty. This is her model of new nationalism. However, such uses of the nationalist spirit do not make up nationalism itself. Ruling class ideas including those of the nation serve the rulers. Such instrumental use of nationalism by the ruling classes cannot be characterised as the reality of new nationalism just as an instrumental use of a subjectivity cannot be treated as new subjectivity.

In fact, the contemporary Indian state merely invokes nationalism as an ideological device to suppress all sorts of political or terrorist movements. The TADA, for example, has been widely used as a so-called national security measure against women, dalit and civil liberty activists, peasant and labour leaders, just as much as against the terrorists in Kashmir or Punjab. In this instrumental use of the appeal to nationalism, the crucial distinction between the people's struggles and the terrorist struggles ceases to exist. Such a use fails to recognise the Indian nation which is in its making.

The Hindutva forces and their middle class ideologues too talk of Swadeshi, 'cultural nationalism', etc. But, in hegemonic politics, mere talk of an idea does not necessarily become a genuine belief. Such talk is meant to convince the masses. One must distinguish between the spirit of nationalism as prevalent among the masses, on the one hand, and the uses of this spirit by the ruling class parties and the middle class ideologues to further their own interests, on the other hand.

Niranjana commits another error of a fundamental type. She suggests that one finds in the dominant ideologies of today a rejection of the Indian state. She argues that a rejection of the Nehruvian welfare state as associated with the ideology of economic liberalisation is in fact a rejection of the state itself. On the one hand, she rightly identifies the liberalisation ideology as the rejection of a form of the state. On the other hand, as a reaction to her critics, she claims that in the contemporary dominant narratives the Indian state itself is rejected. Such a thesis is plainly inconsistent. As a result, she misses out completely how the recent retreat of the state as a development agent simultaneously endorses the coercive machineries of the state meant to guard the market forces. True, the ruling ideologues today imagine themselves as anti-state by simply attacking the Nehruvian state, but they do not reject the coercive machineries of the Indian state whose violent character is revealed every day in relation to struggles by adivasis, dalits, women, peasants, workers and nationalities spread across this subcontinent.

Since Niranjana equates the imagined state power and its imaginary rejection with the actual state and its real rejection, she fails to relate to the dual character of the ruling ideas of our times: for example, pro-liberalisation middle classes in their disavowal of the state actually endorse its coercive roles in the name of 'national pride and national security'. They endorse its pro-market policies in the name of 'glamour and righteousness' associated with the imperial modernity. Niranjana draws our attention to the above powerful seductions. But she does not show much interest in knowing how the ideological seductions are useful to shroud in mystery a really coercive state power because she imagines the state as a rejected entity. Her error thus essentially lies in equating an imaginary process with a real process. This, indeed, is an idealist equation which, as shown above, does not help us to understand the many complexities and subtle distinctions associated with the dominant ideologies and institutions in contemporary India.

N.K. Industries Ltd.

Govt. Recognised Trading House

Regd. Office : 7th Floor, Popular House, Ashram Road, Ahmedabad 380 009, India • Fax : 91-79-425220

ISSUE OPENS ON 8TH AUGUST '94

HIGHLIGHTS

- Existing, Profit making, Dividend paying Company since last three years.
- Govt. Recognised Export House with Export of Rs. 41.57 Crores upto 10-01-94.
- Promoters with proven track record in the Castor Oil Industry.
- The Company diversifying into castor oil derivatives a Sun-Rise Industry with Growing potential.
- The Company's Project coming up in backward area with full backward area benefits.
- Expansion Project is being funded by IDBI to the tune of Rs. 750 Lacs.
- Post Issue Promoters holding will be 75%.
- About 70% of the production bought by Nidera Handelscompagnie b.v., Rotterdam, NL and Braswey S.A. Brazil.
- Entering Global Market for agriculture commodities through trading branch at London U.K. RBI has already granted permission for opening the branch.
- Easy liquidity-Shares to be listed at Ahmedabad, Bombay, Delhi, Madras Stock Exchanges.

RISK FACTORS

External Factors

- Unit being an agro commodity processing company, hence any adverse climatic conditions can affect the operations of the company as regards availability of castor seeds.
- Unit is mainly operating in International market, hence any unfavourable market condition or Government policy regarding exports can directly affect the operations of the company.
- Competition from existing and new units as quite a few are expanding.
- In the absence of appraisal of the project by the lending Institutions there will be no monitoring by the financial institution/s/on the deployment of the issue proceeds is left to the management of the company.

Internal Factors

- Delay in implementation of the project can affect performance of the company.
- The company is having the sanctioned power of 600 KVA. The company has already applied for additional power of 1600 KVA. The company is yet to receive the sanction of additional power.

NOTE : Investors may note that in case of oversubscription the allotment shall be on a proportionate basis and a SEBI nominated public representative shall be associated in the process of finalisation of Basis of Allotment.

NOTE : THE INVESTORS ARE ADVISED TO REFER TO THE PARA ON 'JUSTIFICATION OF PREMIUM' BEFORE MAKING AN INVESTMENT IN THIS ISSUE.

Public Issue of 15,00,000 Equity Shares of Rs. 10/- each for cash at a premium of Rs. 30/- per share aggregating Rs. 600 Lacs.

ON APPLICATION RS. 20/- PER SHARE • *Minimum Application for 200 Shares*

CODIFIED HINDU LAW: MYTH AND REALITY

"Message on Today's Auspicious Independence Day"
"Our Supremacy lies in our Unity"

We had taken over the reigns of the administration of Gujarat with the determination and dedication to lead the State in the coming years on the path of its integrated development, peace, prosperity and progress.

We are equally committed to see that proper law and order is maintained in the State and an adequate security is provided to its people.

With a view to providing social and equitable justice to the poor, backward, women and minority communities of the State, various welfare and poverty aleviating schemes are being implemented by the Government. I re-iterate that Narmada Project shall be completed within its set time frame.

I am confident that with the whole-hearted cooperation and support of the people of Gujarat, my administration will be able to translate our commitment of making Gujarat a first rank industrialised, prosperous and viable State into a reality.

May I appeal one and all to let us unitedly pull together, which is the prime need of the hour, so that we can realise our avowed aims.

- CHHABILDAS MEHTA
CHIEF MINISTER, GUJARAT STATE

Highlights of Achievements:

(A) LAW & ORDER :

* Notable successes achieved in our vigorous campaigns against curbing crimes and apprehending anti-social elements and core criminals in the state
* Rewarding the police by giving cash awards to them for their gallant efforts at the risk of their lives in apprehending criminals and anti-social elements

(B) NATURAL CALAMITIES :

With a view to providing extensive and timely relief to the flood-hit people of State on war-footing, Secretary-level Supervisory Teams have been constituted.

(C INITIATIVES TOWARDS SOCIAL AND EQUITABLE JUSTICE.

27 percent reservation provided according to the Mandal Commission Report for the various categories of Socially and educationally backward classess in Government jobs and admissions in medical and engineering educational institutions

(D) SARDAR SAROVAR PROJECT

Out of the total 4,500 project affected families of Gujarat, 4271 families have been provided 8500 hactares of land for agricultural purposes and lands for rehabilitation for 4194 families at 104 sites

(E) INDUSTRIAL DEVELOPMENT :

As a result of various incentives and condusive policy of the State Government for industrialisation, over 1450 major projects with the investment of over Rs 54,000 crores are in various stage of implementation

(F) EDUCATION AND HUMAN RESOURCES DEVELOPMENT:

Dr Ambedkar Open University has been Set up to impart higher education in Gujarati medium to students from the year June 1995

(G) PEOPLE ORIENTED ADMINISTRATION :

A scheme of on-the-spot disposal of the problems of the people by ministers at District Panchayat Headquarters has been initiated.

(H) SOCIAL AMITY & CORDIALITY :

People of all the communities celebrated their religious festivals, including Moharrum, Rath Yatra and Id, in an atmosphere of unprecedented amity and cordiality An atmosphere of harmony and goodwill has been generated.

(I) PENDING ISSUUES WITH THE CENTRAL GOVERNMENT SOLVED :

A new royalty formula for the oil produced in state has been forged which would fetch an additional income of Rs. 26 crores per annum.

Hindu Law: Myth of Reform

In the first decades of Indian independence, the codification and reform of Hindu personal law was hailed as a symbol of the new government's supposed commitment to the principles of gender equality and non-discrimination enshrined in the Constitution. The history of Hindu law reform, however, shows that when reformers claim to speak on behalf of huge segments of population, whose traditions and institutions they have no real knowledge of, they are more likely to do harm than good. Reform, to be meaningful, has to be based on creating a new social consensus, a task seldom taken seriously by those who are enamoured with statist measures imposed from above. 2145

Telecom Policy

The government's new Telecom Policy is supposed to facilitate India's advance to a world class telecom service. In fact the policy has all the hallmarks of the present government's way of functioning—above all, lack of a clear policy framework and *ad hoc* decision-making. Instead of dealing with the basic issues—cheaper telecom access, rural telephone services and modern data communication for industry—the ideology-driven Telecom Policy focuses on the 'need' to privatise the telecom network. 2125

Small Industry Revisited

It is essential to design strategies and implement policies and programmes of the states for the growth of modern small-scale industry in conformity with the economic reforms of the centre. A prerequisite for such policy formulation is a stock-taking of the performance of small industry in the different states. A review of growth of small industry in Kerala brings out major weaknesses of size-structure and industry-mix as well as other structural factors which point to the need for designing new growth strategies. 2168

Electoral Reform and Beyond

It is imperative to take a number of measures, including a change in the electoral system, to curb money and muscle power in the elections and, equally important, the role of lobby power in influencing government decisions. 2138

Of the Earth

Re-establishing the coexistence of indigenous peoples and the natural resources around them and defining the new relationships between them pose a major challenge to those charged with implementing the Wildlife (Protection) Act. 2131

Domain of Meaning

One side of religion is undoubtedly conflict, disharmony and bloodshed. But as society becomes more bureaucratic and technocratic, the dimension of meaning will become more important and religion deals with the domain of meaning. 2130

IISCO Story

Is it merely ideological aversion to the concept of public enterprise or are there other, deeper reasons for the government trying to hand over Indian Iron and Steel Co to some private party with neither the funds nor the technical and managerial capabilities to handle its problems? 2121

Caste and Society

The Bahujan Samaj Party's demand to rename Poona University after Shahu Chhatrapati takes its significance from the entire history of caste relations in Maharashtra, most particularly the troubled connections and contradictions between the social movement and the national movement. 2128

Muslims and Mass Media

The general tendency of the media to portray Muslims in a poor light, the severe weaknesses of the Muslim-owned press and the ameliorative steps that need to be taken in this regard formed the focus of discussions at the first meeting of the newly-formed Indian Association of Muslim Social Scientists. 2134

Epitaph for Land Reform

The fate of implementation of land reform when the landed elite wield political power and there is no countervailing pressure from below is illustrated by an examination of cases before the land tribunal in Gulbarga district of Karnataka. 2132

LETTERS TO EDITOR

Rural Reforms in West Bengal

AS is described by Kristoffel Lieten ('For a New Debate on West Bengal', *EPW*, July 16), one has no option but to admit that the ongoing process of rural reforms in West Bengal has done quite well. However, it must also be recognised that in many cases corruption, nepotism, inefficiency have been rampant and the panchayat system has not resulted in a well-defined rural development trajectory but given rise to *ad hoc* spending of funds. What remains under-stressed is the necessity of matching the needs in terms of human resources. While it is possible to stretch the decentralised system to village levels (and is actually done), the process generates the need for human resources capable of managing different activities in an efficient manner. In order to develop an area, one has to plan for development projects, execute them, and then run and maintain the assets. They need different skills: managerial, contractual, accounting, and finally political. Practically nothing has been done over the years to develop or improve these qualities of the rural community. It is sad that even after 15 years, there is no sign of any change in the existing education system in order to cater for the recent needs. As a short-term measure, Block Development Offices (BDO) can be modified to some extent and one officer can be entrusted with the task of providing the panchayats with technical help for formulating development plans.

Lieten also provides some excellent suggestions for future action. One is the decentralisation of public utilities. On the one hand, WBSEB is incurring heavy losses and the power supply is erratic though it has improved recently; on the other, large rural areas remain practically unserved. WBSEB can shed its responsibilities to local authorities on contractual terms for payment and supply, much in the same way as Rural Electrification Boards (REBs) work in Bangladesh. Moreover, these local authorities can take care of all energy needs of the community which is not limited to electricity. Studies suggest that rural energy needs can be satisfied from other sources (for example, biomass and renewable energies) at lower costs. In the process, WBSEB can improve its financial condition and the rural areas can be better served.

Similarly, better communication and infrastructural facilities are of great importance for any development. It appears that the Left Front government (LFG) is sceptical about private participation in development projects. Beyond all political and ideological rhetoric, if the alleviation of poverty remains the objective of any government, then pragmatism has no alternative. After 15 years in power, the LFG should have been convinced by now that there is nothing wrong in associating private parties in development activities, if it serves better the overall objectives of [illegible]

development. Though remote villages have been connected by paved roads, it must be emphasised that the transport system remains inadequate. This has not only restricted the transfer of goods and services, but also acts as a constraint to development. As a result, there has not been any improvement in the industrial front in rural areas, though there are enough opportunities for agro-based industries. The LFG can consider big highway projects for private development in order to connect different parts of the state in a more efficient manner. Private development will necessarily mean 'toll system' for usage but will prove profitable on grounds such as economy of time, generation of employment, alternative mode of transport, etc.

In mobilising resources, panchayats can be very well used, if so desired politically. In India, direct taxes play a very minor role because of a low tax base. As panchayats deal at the village level, direct taxes (much in the same fashion as the professional taxes) can relatively easily and effectively be collected even from income earners dependent on agriculture and business. This may need simplifying the rules and solving the problems of sharing the revenue. This will improve the financial position of the institutions. But the sense of accountability needs to be instilled.

But the need for human and financial resources will always act as a restraint. There is a need to reorganise the institutional systems at the state or national level to better adapt to new environment. For example, the state cabinet still follows the old system of division of labour among ministries, though a reorganisation favouring better co-ordination among activities for rural areas may prove more useful. It will need more inventive ideas and better application. Above all, it will need political tolerance and pragmatism. Let us hope that things will change for the better.

Grenoble, France

Consumer Identity

SINCE writing 'Ramjanmabhumi, Consumer Identity and Image-Based Politics' (July 2) I learned more about Greaves Co's corporate campaign discussed in my paper, information that puts an interesting twist on the interpretation offered there. Executives with RK Swamy-BBDO who worked on the Greaves ad campaign aver that there was no connection implied with the Babri masjid issue. It was instead a take-off on the symbol of the Great Pyramid, which had been likened to Greaves Cotton Co in an earlier campaign. However, the success of the new corporate identity (launched shortly before the assembly elections in UP, MP, Rajasthan, Delhi, and HP) surpassed all expectations. Trading in Greaves shares rose rapidly in a few weeks, doubling their market value in a month. By September 1993, a month after the initial launch, Greaves shares were put in the 'circuit breaker' category, ie, trading was so hectic that the Bombay Stock Exchange banned activity for one week. In addition to receiving an award for the best corporate campaign of the year, this signalled a visibility and an interest in the company that Greaves had not experienced for many years. I suggested to executives involved in the campaign that the advertisements' success was linked to lately prominent concerns with identity and historicity in the wider society. Their earlier campaign, which focused exclusively on the pyramid as a marvel, without the emphasis on history and identity change, had attracted relatively little attention. For the copywriter on the campaign, however, this was "too abstract" to comment on.

ECONOMIC AND POLITICAL WEEKLY

Workers' Health

THE health and safety of workers has never been an issue of serious concern—certainly not with the state or industrial managements, but not even with the trade unions. While the state has codified procedures to deal with safety issues under several legislations, the management complies with the letter of the law, when it cannot circumvent procedures and the trade unions, caught in the bind of struggling for the economic survival of the workers in a hostile environment, have, more often than not, converted these matters into counters to be deployed across the bargaining table. Accidents affecting workers inside industrial plants or occupational ill health are made an issue of only if they involve large numbers or if they have other implications. Consequently, industrial safety and industrial pollution are defined as problems only when they affect the larger environment and people outside the industry.

This trend is even more pronounced today when environmental pollution has become a major concern and is being linked in all sorts of ways with the new industrial environment being created. Pollution control laws are being strengthened in various states and certain highly polluting industries, such as cement and paper and pulp, have been asked to adhere to more stringent norms. The centre has also taken other measures for the protection of the environment, such as the continuing ban on plastic waste imports. The environment ministry has appointed an international accountancy firm to assess the damage on the ozone layer due to polluting industries and the cost of shutting down these industries. The survey will assess the health damage due to exposure to carcinogenic agents and estimate its cost to the economy and the loss to the GDP from occupation-related illnesses of workers. The centre's environment impact notification provisions, even though they have been diluted now under pressure from industrialists, allow for people's participation in the setting up of industries and for public hearings in the case of large-scale displacements. Thus workers' health and safety find a place in this scheme of things only in terms of loss to the economy. Nowhere is there a move to give workers a voice in the design or construction of an industry which is hazardous to them, leave alone making it safe for them. However, this economic loss could be minimised if there was an adequate turnover of workers ensuring that production losses due to such illness or accidents are cut down. The increasing trend towards contracting out hazardous jobs through which it is possible to employ workers with little training and no liability will ensure just this. Workers' safety need not be an industry issue or anybody's concern.

The recent accident at the Bokaro steel plant where 12 women contract labourers were scalded to death, or the earlier one where several died when a carbon monoxide pipe developed a leak, which were almost completely ignored by the media, illustrate just this state of affairs. The first accident in April occurred when three engineers tried to plug the leak manually, a practice which apparently is employed routinely since pipe leaks are quite commonplace, and little effort is made to train even engineers, leave alone other workers, in safety practices. The fact that frequent leaks occur is itself a cause for concern, a result obviously of poor maintenance and housekeeping. That these leaks may have caused damage of various sorts is apparently not even reported—according to the law, only those incidents where workers are away from work for 48 hours need to be reported as accidents. In Bokaro the fact that normal production was resumed soon afterwards is being seen by the management as an index of the normalcy of the situation. It is not that there is a lack of information of why accidents occur—even when they are termed as being due to 'human failure' there is enough evidence to show that such failure occurs in circumstances of overwork, undernourishment, badly designed or poorly maintained equipment and a host of such environmental causes.

In the second incident on July 23, a pipe circulating water at high temperature burst spewing steam at over 200 degrees celsius killing 13 workers, all but one of whom were tribal women employed by the contractor assigned with the job of clean up operations prior to a VIP visit. While the superintendent and several others have been suspended pending an internal inquiry, nothing is likely to come of this given the management's attitude that charges of improper maintenance are "totally baseless". The fact is that it is hard to assign responsibility for the accident: the boiler and the piping around it are mandatorily inspected periodically by an independent authority, while the regular maintenance is undertaken by the plant authority. That these inspections are a farce is widely known; who then should be blamed for lack of maintenance? The authorities have reportedly made the ridiculous statement that women workers would now be made to wear aprons compulsorily, which makes no sense whatsoever, except by way of the usual attempt to pin the blame on workers' lack of safety consciousness.

The trouble is that workers' health and safety is not an issue which may be dealt with easily or circumspectly. It impinges on the nature of industry, the relationship between the worker, the management and the state, and is ultimately a product of the status of the worker in society. The current trend towards the devaluation of labour and the erosion of hard won rights is hardly conducive to recognition being given to issues of health and safety at the work place.

FOREIGN INVESTMENT

'Open for Business'

THE government will, in the next few days, sign the counter-guarantee agreement with Enron for the Dabhol power project in Maharashtra. Power minister N K P Salve gave this categoric assurance, appropriately enough, at a meeting of the Indo-American Chamber of Commerce this Wednesday. Not that there was the slightest chance that the government would be permitted to entertain any second thoughts in this matter, certainly not after the plain speaking by the US energy secretary, Hazel O'Leary, during her visit to this country last month. The US official had made it clear that nothing less than a sovereign guarantee from the government of India to the US firms proposing to put up power projects here, of whom Enron is one, would convince American businessmen that "India is a good place to do business". The government of India has not demurred and it is to be assumed that its guarantee, on the same omnibus terms as offered to Enron, will be available in due course to the six other power projects to be built by foreign companies which have been cleared by the cabinet committee for business affairs.

Instead of admitting that the country has been made to submit once again to arm-twisting by the US government on behalf of American business, the power minister has been pretending to discover all sorts of virtues in the specially favourable terms, including the sovereign guarantee, which have been offered to foreign investors in the power sector. Thus Salve has advanced the claim that the government guarantee is a means for making the state electricity boards more efficient. Under the terms of the guarantee, in the event of default by the boards in respect of payment for power purchased from the foreign companies, the government of India will be legally bound to step in and make good the default. It would presumably recover the amount out of the funds transferable from the centre to the concerned state government. Now, the obvious question of course is, if the guarantee is seen as such a potent means of toning up the functioning of the SEBs, why should it not be adopted more generally and extended to other companies, including public sector companies such as the NTPC and BHEL which, as is well known, have been major victims of defaults in payment by the SEBs? As has been pointed out by the BHEL chairman recently, the SEBs owe BHEL Rs 1,000 crore and the NTPC more than twice as much.

Instead of engaging *ex post* in a search for semi-literate rationalisations of the terms dictated to it by the foreign companies, with the help of pressure applied quite openly by their respective national governments, the power minister and his ministry should have spent their time, once the government had in its wisdom come to the conclusion that large-scale involvement of foreign companies was essential for the expansion of electricity generation capacity, in working out an overall policy which, while offering attractive enough terms for the intending foreign investors, would also pay some minimum of attention to safeguarding the country's interests in terms of efficient and economical production of power. Unfortunately, the power minister and his department have been too busy wooing foreign investors and inventing justifications for their every whim and fancy.

In fact the favoured terms which have been offered to the foreign investors in the power sector—specifically, the assured 16 per cent rate of return on investment and the government guarantee in respect of payment for power sales to the SEBs—have placed in the government's hands entirely legitimate and universally accepted levers to secure economical and efficient construction and operation of the power projects in question. However, the power minister's attitude in this regard, even as he has been energetically campaigning in support of the foreign companies' demands, has been shockingly lackadaisical. In a newspaper interview last week Salve appeared to concede that the cost estimates of the power projects to be put up by the foreign companies are actually very high, but he could not be too bothered about this. Pointing out casually that there was no one in his ministry "who can look at complicated cost analyses", he was content to shift the blame to the Central Electricity Authority which, according to him, was the body charged with vetting private sector power projects.

Past experience—of the fertiliser industry, for instance—has established conclusively that the offer of a guaranteed rate of return is a virtual invitation to the investor to inflate project costs. And when the guaranteed return is linked to a particular level of capacity utilisation—as it is in the case of the Dabhol and other power projects—the temptation proves irresistible to build in a cushion of extra capacity so that the stipulated level of utilisation of the nominal capacity can be shown to have been achieved even when the utilisation of the actually installed capacity is significantly lower, in other words, even when the plant is being operated less efficiently than suggested by the figure of nominal capacity utilisation. In the present instance, there is in addition the comforting assurance of full offtake by the SEB of all the power produced.

One way of dealing with these problems is to insist upon competitive bidding for plant and machinery for the projects. However, Salve's response to the suggestion has been one of outrage, as if what is being suggested is something which is bound to be found insufferably offensive by the foreign investors. This is nonsense. There is not a whiff of obsolete ideology nor the slightest trace of any East India Company syndrome in the demand that the government insist that Enron and the other foreign companies follow established procedures of competitive bidding and international tendering for acquiring machinery and equipment for the power plants that they are proposihg to set up. This is no more than what the World Bank insists on in respect of projects which are even part financed by it. But India's power minister is shocked by the suggestion, even though, going by the case of the Dabhol project, by far the larger part of the cost of these power plants will be financed by loans from Indian financial institutions.

Clearly, the foreign companies cannot really be blamed if they have come to believe that they are dealing with some banana republic after all.

MAHARASHTRA

Curtain-Raiser for Polls

WHATEVER the truth about the revelations of corruption in high places by the deputy municipal commissioner, now suspended, G R Khairnar, they have certainly caused more than a flutter. Interestingly, while there have been plenty of accusations and denials, little has emerged by way of hard facts. And as for the facts which have emerged, the political establishment has dealt with them in a typical fashion: by questioning not their veracity but the legality of possession of certain documents and the manner in which they were obtained. In other words, while a section of the bureaucracy has been forced to expose corruption in the political establishment which it has long condoned and allowed to spread, the latter is taking recourse to procedural norms, interpreting the limits of secrecy, etc, all of which are usually in the realm of the bureaucracy. Thus, for instance, the fact that the former municipal commissioner S S Tinaikar had in his possession the report of the Lok Ayukta (supposedly confidential) which he used to substantiate certain allegations of corruption, is being made the subject of great concern by the ruling party and a high-level inquiry has been ordered by the speaker of the state assembly, even while the Lok Ayukta has castigated Pawar for his inaction on the report. Consequently the monsoon session of the assembly saw debate sink to the level of accusations and counter-accusations and whether the Official Secrets Act had been violated, whether condoning the action of civil servants using information which they have come across when in office to expose the political establishment would not lead to a collapse of the administrative machinery, and so on. The irrelevance of the debate was further emphasised by the chief minister's rhetoric on the 'sinister designs' in the campaign to besmirch his name.

It is, of course, a fact that the revelations of corruption involving the chief minister

come at a time when he has manoeuvred himself into a position to relaunch his bid to move back to the centre. If the Congress Party in the state were to demonstrate its stability and staying power, Narasimha Rao cannot sustain the myth of the state needing him more than the centre. However, things have not been going very well for Pawar in the last couple of months. Before that, 'success' in dealing with the bomb blast kept up the image of his efficiency and his ability to rally round him even those who are opposed to him, in times of crisis. In recent months the involvement of Congressmen in the scandal in Jalgaon which appears to be a well-established 'business' of forcing girls into nefarious activities, as well as Khairnar's allegations have cast a shadow over the party's prospects in the assembly elections. The rumour that the chief minister is contemplating advancing the polls to November to coincide with assembly elections in the two neighbouring states of Karnataka and Andhra Pradesh is obviously being floated to test the waters—at the party high command and the election commissioner's level as well as among opposition parties. Given that the party is not too confident of its performance in the other two states, the party high command may well give the green signal. But this still means that the EC has to accede to the request. In a strange way, however, it is possible that Khairnar and company have provided a focus for dissenting groups in the party to rally around the chief minister. The announcement of early elections may succeed in diffusing any attempt to pose a challenge to Pawar within the party.

STOCK MARKET

Loaded Proposal

THE manipulative practices being resorted to in the name of liberalisation by corporations, foreign ones no less than Indian, seem to have no limits. And, as always happens, the government has woken up to the implications of the devices and stratagems being used a little too late. The horse has apparently disappeared by the time the government has bestirred itself to bolt the door.

According to one estimate, anywhere between Rs 5,000 and Rs 8,000 crore may have been involved in the underpricing of shares preferentially allotted by companies to their promoters, collaborators and what have you. Whatever the exact figure, the amount involved is clearly staggering and well might exceed the figure worked out by the CBI as having disappeared or as being untraceable in the course of the securities-cum-banking scam.

Now the companies have started asking their shareholders for permission to buy back their own shares, even though this is prohibited under the company law as it now stands. Reliance Industries, for example, proposes to seek such approval at its annual general meeting later this month. The grounds offered are that flexibility to buy back own shares gives a clear signal to the market that the company considers its shares undervalued, that the company can thus use its surplus funds advantageously with a minimum of risk and that the move sends a positive message to the investing community in India and abroad.

Hidden behind all such arguments are the possibilities that are thrown open for manipulation of the stock market. Not that this does not take place now. There exist already several ways of doing so and doing it quite legally but within limits. But once companies are allowed to circumvent the existing rules and buy back their own shares, there can be no limit to the manipulation of the prices of their stock. Lest it be forgotten, if a company wishes at one point to buy back its shares, it would someday in the future want to unload them also. The scope for insider trading in shares will increase enormously.

But the government, in its enthusiasm to liberalise, may still fall for the bait and permit resort to a practice which cannot but have very serious repercussions.

POLITICS

A Trade-Off?

WHETHER or not corruption emerges as the major issue in the next round of elections to the state assemblies, as the opposition parties in parliament expect it will after their resignation from parliamentary committees and their boycott of the current session of parliament, there is little doubt that the government's so-called action taken report on the stock market scam and the opposition parties' response to it have confronted both sides with some larger political issues.

Within the opposition, the National Front-Left parties and the BJP have so far acted in parallel fashion even as they, the former in particular, have been careful to avoid giving any impression of united or joint action. But the prospect of fresh elections should the present deadlock in parliament prove unresolvable has made for differences over the future course of action, specifically how far to push the ATR issue. Naturally, the Congress has sought to remind the opposition parties of the possibility of their having to face a mid-term poll, knowing that these parties in general, and the National Front-Left parties specially, have little appetite for elections just now. The impression is widely shared that even if the Congress were to lose some ground in certain parts of the country, the gains would largely accrue to the BJP. This has brought up the question, in Left and CPI(M) circles particularly, whether the BJP is not after all the greater enemy and whether, in view of this, it would not be wise to work for a compromise on

TWENTY YEARS AGO

EPW, Special Number, August 1974

With the presentation of the supplementary budget on the last day of July, the current official flurry of what had been tom-tommed as anti-inflationary measures is evidently over. The contents of this so-called budget have revealed, as nothing else has, the basic cynicism of the authorities in tackling what is certainly the gravest crisis of the Indian economy since independence. Despite the long preamble on the impelling need to counter inflationary forces, not one element in the supplementary budget could even remotely be claimed to help restrain prices; the impact is likely to be of a quite contrary kind.

The objective of the supplementary budget was altogether narrow and short-term. The government is obsessed by an anxiety not to let the fiscal deficit for the current year exceed the figure mentioned in the regular budget presented in February, namely, Rs 126 crore. In the five months since then, several things have happened, and the general price index has jumped by close to 15 per cent. Food subsidies would now cost much more than was originally contemplated; the burden of various other items of expenditure on the current account would also be considerably in excess of earlier estimates; on the other hand, because of the near-stagnancy of the economy, revenue receipts have tended to fall off; the brutal crushing of the railway strike has been a pyrrhic victory and has only worsened the state of the Railway Board's parlous accounts. All these facts have forced the government to launch a series of exercises to slash public expenditure. Apart from certain symbolic reductions here and there, no sizeable cut in non-developmental outlays is evidently possible. It is a different matter with Plan expenditure, which will be subject to heavy reduction. Even that might not however save the day. Tapping the capital market via the captive banks and public financial institutions could of course be done, and the experiment repeated a number of times, still, that would be small beer. Little is going to be achieved in the way of financially disciplining the states, despite periodic admonitions, their drawal on the Centre's resources is bound to continue, political realities being what they are.

Even if only for the sake of record, the government has to be told that it is altogether on the wrong track in its search for instant solutions to the problem of inflation, and that the kind of disciplining of demand it is bent upon will not even touch the fringe of the problem till as long as there is no disciplining of the elements operating on the supply side of the phenomenon. It has also to be told that its pretensions of controlling prices cannot but sound hollow in a context where it itself, through its own acts and decisions, stokes the fire of inflation; there must be a modicum of internal consistency among the measures it initiates before it can either attain its goals or even succeed in convincing others that it is serious in its intentions.

the ATR issue at some point. This, of course, is what the Congress is banking on.

In the Congress, the more or less imagined slighting of Rajiv Gandhi by former president R Venkataraman in his recently published memoirs and the sharp and effective reaction of the opposition parties to the ATR have provided the opportunity for elements whose claim to prominence in the party rests on their closeness and loyalty to the Nehru-Gandhi household to disturb the appearance which Narasimha Rao had managed to create briefly of a more or less unified party under his conciliatory and consensus-seeking leadership. The Congress leadership has been able to deal with the problem of Venkataraman's reminiscences by getting one of the party secretaries to publicly dissociate the party from the former president's views on Rajiv Gandhi. The ATR issue is, however, proving a little more difficult to deal with.

It has been interesting to watch the activation of relatively well organised caucuses among Congress MPs and in the state party set-ups which have overnight become vocal about the importance of the government being seen to be dealing firmly with corruption and, in the present context, specifically with those held responsible in varying degrees in the Joint Parliamentary Committee's report on the stock market scam. The development has been viewed seriously enough by the Congress leadership to warrant the prime minister holding meetings with groups of party MPs from different states. At these meetings Narasimha Rao is known to have emphasised the harm that might be caused to the Congress if the government were to give in to the opposition's demand for more stringent action on the JPC report.

Of course, Congress functionaries claiming closeness to the Nehru-Gandhi household suffer from a congenital infirmity in regard to making corruption the central issue in even a tangential confrontation with the party leadership. There is, above all, Bofors to worry about still, especially since in the coming weeks the government is expected to be provided by the Swiss authority with the long-awaited information on the secret bank accounts into which the bribe paid by the Swedish company found its way.

It is not unlikely that it is precisely with a view to preparing the ground for dealing with the latter eventuality that a particular section in the Congress has chosen to make a fuss about the government's action taken report on the securities scam. If the prime minister believes that it will harm the Congress party if the government were to give in to the opposition parties' demands for stronger action on the securities scam, how can he take a different attitude to similar demands in regard to the incriminating information on Bofors that may soon be coming into the government's hands?

WORKING CLASS

At a Dead-End

THE Sangrami Shramik Union (SSU) of the Kanoria Jute Mill workers has obviously reached a dead-end. Indeed, the situation is so grave that its *raison d'etre* can be questioned. That is, its stimulating role in promoting the self-activation of the workers has today, to give it the most favourable interpretation, been put in suspended animation, while the chief occupation of its important leaders has turned out to be the lobbying of union ministers in New Delhi and the Congress(I) leaders in Calcutta. In other words, if the CITU leaders are hopelessly dependent upon the patronage and guidance of the Left Front government in West Bengal, the SSU leaders are now engaged in courting the union ministers' favour to attain their main objective—the re-opening of the closed mill. Recently, an eminent leader of the SSU told *The Statesman*, Calcutta, about "the encouraging signs from the Centre", by which he implied the sympathetic responses of the union commerce minister and the union minister of state for textiles. Whatever the true worth of the sympathetic noise and nods of the union ministers, it is no secret that they have been secured through the mediation of Mamata Bannerji, MP, the fierce opponent of the West Bengal Left Front government. While these parleys and palavers have been going on, the public actions among the concerned workers and their sympathisers in and around Calcutta seems to have come to a halt.

Yet unaware of its parleys with the union ministers, the July 1994 issue of the monthly publication of the West Bengal CITU editorially taunts the SSU about its militant tactics and once again casts its pearls of sedate wisdom, namely, that "if militant movements are to be developed at all, they will have to take the form of a countrywide united mass struggle. Not factorywise adventurist actions" (translated from the Bengali original). As if a countrywise united mass struggle can ever develop into a reality through its invocation in CITU press and advocacy from CITU platforms only, without the pathbreaking militant factory-wise actions. Thus between them, the SSU and the CITU leaderships are offering the exploited and harassed Kanoria workers and their ilk in other similarly placed establishments very little hope for success in getting their due relief through militant self-activation.

Past history apart, our trade union leaders can usefully take a leaf out of the Indonesian workers' union SBSI's book. This organisation, unregistered and unrecognised by the government and working independently of the officially-sponsored SBSI, has been able to confront the military rulers by organising in recent months a series of strikes in a number of factories. The government has now formally banned the SBSI and is stepping up other repressive measures. But the workers are undaunted. They are seeking international linkage to face the government offensive. This is no doubt a hard struggle. But there is no royal road to united countrywide mass action.

Superstar Welding

PROMOTED by Advani Oerlikon, Superstar Welding is engaged in the manufacture of general purpose welding electrodes since 1984-85 and has developed technology in-house for the manufacture of special electrodes for low alloys and high tensile stainless steel, etc. The company is now modernising its existing operations and expanding its present capacity to 4,000 mt. It also plans to enlarge its range of products to manufacture welding rods for special uses so as to enhance its coverage of the market and increasing its competitiveness and profitability. The company's products are used for welding in various industries using mild steel, cast iron, stainless steel, etc. The project which is being set up at a total cost of Rs 7.4 crore will be financed through equity capital of Rs 6.4 crore, interest free loan from promoters of Rs 15 lakh, unsecured loans of Rs 50 lakh and internal cash accruals of Rs 36 lakh. The project is expected to commence commercial production by this November. To part finance its project the company is entering the capital market with a public issue of 42,70,000 equity shares of Rs 10 each at par. The issue which will open for subscription on August 31 will be lead managed by Jolly Leasing and Finstock.

Global Trust Bank

Global Trust Bank, which has been promoted by Ramesh Gelli, Jayanta Madhab and Sridhar Subasri, plans to set up 10 branches in the first year and have 50 branches in five years with its headquarters in Secunderabad in Andhra Pradesh. The bank will have a total paid-up capital of Rs 104 crore out of which IFCI has approved participation of up to Rs 10 crore and 2,60,00,000 equity shares of Rs 10 each at par are being offered to the public. It has entered into a technical partnership agreement with Hambrecht and Quist, San Francisco, USA to provide technical skills and inputs for a wide range of equity-related capital market products and services. Further, it has also entered into a technical partnership with TA Enterprise Berhad, a leading investment bank and securities company in Kuala Lumpur, Malaysia. The bank's public issue is slated for August 25.

Bafna Spinning

Bafna Spinning is setting up a 100 per cent export-oriented unit for manufacturing cotton yarn. The project is being set up at a total cost of Rs 40.8 crore and will have a capacity of 18,240 spindles. Of the total cost, Rs 21.4 crore (52 per cent) will go towards importing plant and machinery. The company expects to commence commercial operations by December 1994 and has already tied up its entire production with Universal Textiles of UK and Leader Weaving of Indonesia. To part finance its project the company is entering the capital market with a public issue of 91.8 lakh equity shares of Rs 10 each at par on August 16.

Valplus Biotech

Valplus Biotech has received SEBI clearance for its Rs 75 lakh public issue which will open for subscription in the second week of September 1994. The company is setting up greenhouses of four hectares (four houses, one each of approximately one hectare) and will produce 60 lakh exportable flowers, generating a sales turnover of around Rs 6 crore when it is fully commissioned. The company has already commissioned greenhouses in two hectares and planting has commenced. Exports for these facilities are expected to commence by November this year while balance commissioning will be completed by February/March 1995. The project, which is being set up at a total cost of Rs 6.15 crore, has already been declared as a 100 per cent export-oriented unit by the ministry of industry-SIA, government of India.

Axel Polymers

Axel Polymers is setting up a Rs 6 crore project for manufacturing compounds, blends and alloys of engineering polymers like polyamid 6/66, ABS, PC, PBT and PET, etc, near Baroda with an installed capacity of 1,600 tpa. Under the guidance of its collaborators, namely, Alusuisse Italia Spa, a member of the multinational LONZA, Switzerland, the company plans to service the small speciality plastic processors in the field of engineering plastics and plans to provide varied types of composites of international quality. It is importing the equipment required to be used in the process from a leading and prestigious manufacturer, namely, Werner and Pfleiderer GmbH, Germany. To part finance its project the company is entering the capital market with a public issue on August 25.

Ajwa Fun World

Ajwa Fun World and Resort is entering the capital market on August 31 with a public issue of 35,00,000 equity shares of Rs 10 each. The issue, which will be lead managed by Bank of Baroda, is to part finance an amusement park (the first of its kind in Gujarat) with 18 rides 14 kms away from Baroda, near Ajwa Garden. The park has commenced operations in April this year with 10 rides like 'Park Express', 'Dragon Coaster', etc, in addition to other entertaining components like fast food corner, coffee, ice cream parlour and other refreshment facilities. The company now plans to develop a resort with 33 AC/non-AC cottages with restaurant and conference hall and other allied components such as health club, children's park, swimming pool, etc. Further it will also have facilities like EPBAX and satellite entertainment with modern devices. The project is expected to cost Rs 7.25 crore (of which Rs 3.56 crore will go towards the amusement park and the balance for the resort project) and is to be financed through equity capital of Rs 5 crore, term loans of Rs 1.75 crore from Bank of Baroda and unsecured loans of Rs 50 lakh. The project is expected to be completed by October this year.

Aban Loyd Chiles

Aban Loyd Chiles which declared encouraging results for the year ended March 1994, notching a total income of Rs 60.9 crore (up 19 per cent over the previous year) and a profit after tax of Rs 14.1 crore (up 108 per cent) has maintained its leadership in oil drilling in offshore locations, owning and operating three rigs. In response to the government's deregulation policy, the company now proposes to enter the oil refining business by setting up a three million tonne refinery. Financing plans for the expansion project, which is being set up near Tuticorin, Tamil Nadu, are being worked out.

Efcon Securities

Efcon Securities, which is engaged in the business of corporate management, merchant banking, international finance and other specialised areas of non-banking finance companies, has received the prestigious World Bank registration from Washington as Financial Consultant for World Bank-aided projects and is now expecting similar registration with Asian Development Bank. Following this the company will be entering into the highly specialised areas of bilateral as well as multilateral fund negotiation on behalf of government/semi-government companies, undertakings and other public sector enterprises. In addition to being active in its present line of business and enlarging its activity base in the areas of euro issue advice, foreign currency loan syndication, venture capital and corporate consultancy for financial reengineering, the company also plans to enter into fund-based areas like leasing, hire purchase, equipment finance and industrial finance by the end of the year.

CURRENT STATISTICS

***EPW* Research Foundation**

Even as the deadlock in parliament over the government's action, or the lack of it, on the last stock market scam continues, the boom in stock prices in recent weeks has been reminiscent of the scam. At 4508 on this Friday, the BSE's Sensitive Index had in fact surpassed the highest closing level touched during the scam period. In just one month, the Sensitive Index has risen by 81.5 per cent and the National Index by 83.9 per cent. At the end of June, market capitalisation of companies listed on the BSE stood 135.6 per cent above the level of a year ago, with the P/E ratio of shares in the Sensitive Index having risen to 51.9 from 29 3 Interestingly, gross and net investment in the primary and secondary markets by foreign institutional investors in July was, however, the lowest by far for any month of 1994 so far

DUNLOP INDIA

Technological Edge

A CHABBRIA group company, Dunlop India saw a fall in its net sales and profitability (on an annualised basis) during 1992-93. Though net sales in 1992-93 (18-month period) rose from Rs 564.3 crore in 1991-92 (15-month period) to Rs 660.8 crore, there was a fall in sales on an annualised basis by 2.4 per cent while operating profit fell by 35.5 per cent. The company managed to post a net profit only due to the large non-operating income during the year as also because of lower depreciation and tax provisions.

The recessionary trends in the industry, particularly in the truck tyres segment, affected the company's performance. While production of automotive tyres increased from 18.7 lakh nos to 19.7 lakh nos, that of transmission belting fell from 5.7 lakh metres to 5.4 lakh metres. Sale of automotive tyres was also higher at 20.1 lakh nos as against 19.2 lakh in the previous year while that of transmission belting rose from 2.6 lakh metres to 3.3 lakh metres. The company's exports increased by 17 per cent on an annualised basis to Rs 69.2 crore. A significant feature of the year's exports was that unlike the previous years, when the company exported marine products, it has now commenced export of its own products. Though the company continues to export to the highly competitive markets of UK and US, it has reportedly made inroads into the markets of neighbouring countries and the Far East.

The company enjoys a significant edge in the domestic market and is a market leader in most of the industrial product ranges, mainly due to its various foreign technical collaborations which ensure the latest technology. The company has technical agreements with Sumitomo Rubber Industries of Japan for cross ply automotive tyres and tubes and passenger car radials and with Dunlop of UK for aircraft tyres and tubes. It also has agreements with BTR Belting of UK for steelcord conveyor belting and with Mitsubishi Belting of Japan for cut edge, variable speed timing and banded power transmission vee belts as also for industrial and automotive vee belts. These agreements also enable the company to meet international standards, especially to suit the export requirements of truck tyres particularly for the US market.

Energy conservation measures taken by the company during the year included replacement of the OTR 88" autoclave by a 100" BOM press, installation of the 88" BOM presses to produce rear tractor tyres in place of autoclave and the provision of dimineralised water for PVC presses. These measures have reportedly resulted in the reduction of coal consumption per ton of finished product from 1.725 mt in 1991-92 to 1.722 mt in 1992-93.

The company had plans to create a separate corporate entity to handle its sports goods business. The new company is to be headquartered in Bangalore and will concentrate on becoming an exclusive sports goods company modelled on international giants like Nike, Reebok and Ellese. In addition to the 'Dunlop' brand the company will also develop other brands in keeping with the market conditions and nature of products.

WALCHANDNAGAR INDUSTRIES

New Areas

Walchandnagar Industries, a diversified company manufacturing industrial machinery, plastics, diesel engines, pumps, castings and timepieces, performed poorly in 1992-93 (year ended September 1993). The company's net profit fell drastically by 39.3 per cent over the previous year despite a 3.5 per cent rise in net sales. A sharp rise in manufacturing expenses led to a fall in the company's operating profit. The company's industrial machinery division saw a marginal rise of 1.2 per cent in turnover from Rs 52.9 crore to Rs 53.5 crore while turnover from erection/job work/services spares rose from Rs 29.6 crore to Rs 32.9 crore. Though the Tiwac division's sale was stable at Rs 1.3 crore, that of the Cooper division (which manufactures diesel engines and castings) fell from Rs 4.9 crore to Rs 4.3 crore. The rise in manufacturing expenses can also be related to the rise in proportion of import content of raw material consumed from 10.7 per cent last year to 23.7 per cent and the company's cif value of imports increased by more than 70 per cent.

Meanwhile, energy conservation measures taken by the company include the replacement of the ward leonard drive system of the wd/200 horizontal boring machine with a thyristorised drive system and the replacement of the ward leonard system of the 250 kw drive of the planing machine by a 5 kw dc drive and a 20 kw head for conversion into plano-miller. Energy saver ballasts have also been installed in the hospital area, for light fittings. These measures have resulted in the average power factor improving to 0.987 kag, thus resulting in further reduction in energy loss and cost of production. Line losses in the distribution system in the colony area have also been reduced significantly as per the modification suggested by the National Productivity Council, Bombay. The company is also carrying out modifications of heat treatment furnaces and the electrical distribution system. Further, it also plans to replace welding generators by rectifiers with remote control and energy saving devices.

For 1993-94 the company expects to perform better through its entry into areas such as material handling equipment, material and equipment for chemical, petrochemical and fertiliser plants and higher order book position for sugar plants and boilers. It also plans to secure export orders for the supply of its products to various developing countries in the neighbourhood, west Asia and Africa.

VARUN SHIPPING

Fleet Expansion

Varun Shipping which saw a 39.5 per cent rise in income in 1992-93, managed a 19.2 per cent rise in operating profit despite the worldwide recession in the shipping sector. Net profit more than doubled despite a 77 per cent rise in depreciation provision and a 46.9 per cent rise in interest charges, mainly on account of a large non-operating income (Rs 13.7 crore). Tax liability was nil for the year on account of the unabsorbed depreciation of earlier years. During the year the company acquired two additional vessels, namely, M T JALA DOOT (a 37,243 dwt product tanker) and M V SURYA KRIPA (a 42,628 dwt bulk carrier). The former was purchased at a price of $ 20.2 million and the latter $ 17 million. The company has also acquired a third ship, a 42,605 dwt bulk carrier at a price of $ 17 million. The company's fleet now totals 12 vessels which include six tankers, two bulk carriers and four offshore supply vessels. With the acquisition of the last vessel, the company now has five vessels of above 29,000 dwt.

Despite the relaxation of controls and simplification of procedures in tandem with the liberalisation policy, a serious bottleneck which hampers the growth of Indian shipping is the inordinate delay in the amendment of the Indian Merchant Shipping Act. Foreign lending institutions insist on an amendment of the existing provisions relating to the foreclosure of the mortgage before they grant direct foreign currency loans to shipowners for the purchase of new ships.

The company is planning to expand its fleet further in order to take advantage of further profitable opportunities in the shipping business and for this reason it has increased its authorised capital from Rs 60 crore to Rs 120 crore. With the operation of the enlarged and diversified fleet the company hopes to improve its performance.

For the year ended March 1994 the company earned a net profit of Rs 13.3 crore on a total income of Rs 100 crore. Vayudoot, a 7,012 dwt tanker belonging to the company, became the first vessel flying the Indian flag to call at Durban, South Africa, after 45 years. The call was facilitated by the removal of trading and shipping restrictions by the government of India.

PUNJAB ALKALIES

Capacity Expansion

Promoted by the Punjab State Industrial Development Corporation (PSIDC), Punjab Alkalies and Chemicals (PAC) is engaged in the manufacture of caustic soda. The company saw a 26.3 per cent rise in net sales in 1992-93 and a 15.6 per cent increase in operating profit. However, a sharp rise in depreciation provision and a Rs 3.3 crore tax provision for the year (as against a nil tax provision last year) saw the company's net profit suffer by 15 per cent over the same period. During the year production of caustic soda improved to 45,017 mt from 42,896 mt last year. Liquid chlorine produced was also higher at 25,434 mt at against 23,635 mt produced last year. While sale of caustic soda lye, caustic soda flakes and liquid chlorine improved in volume terms from 31,124 mt, 10,439 mt and 23,084 mt, respectively, to 31,902 mt, 11,258 mt and 25,080 mt, sale realisation improved further from Rs 28.7 crore, Rs 11.3 crore and Rs 2.3 crore, respectively, to Rs 36.3 crore, Rs 13.4 crore and Rs 3.9 crore.

The company has successfully implemented the second phase of its capacity optimisation project and the same became operational in December 1992 leading to further augmentation of its capacity by 23 per cent. The company is meanwhile implementing a 100 mtpd membrane cell caustic project based on Hoechst-UHDE membrane cell technology at its present site at Naya Nangal, District Ropar in Punjab. The technology to be adopted, in addition to being the latest, has several advantages such as being energy saving and helping to cut down product costs in addition to being totally pollution free. The project is to be set up at a total cost of Rs 112 crore and is expected to be operational with effect from April 1995. It is to be financed through a rights issue of equity shares aggregating Rs 46.1 crore (including premium), term loans from institutions of Rs 54 crore, internal accruals of Rs 1.6 crore and any other mode aggregating Rs 10.3 crore. The company's recent rights issue consisted of 102.5 lakh equity shares of Rs 10 each which were offered at a premium of Rs 35 per share in the ratio of one equity share for every share held. Consequent to the rights issue the company's equity capital has increased from Rs 10.3 crore to Rs 20.6 crore.

Measures taken by the company to improve safety, control pollution and conserve energy include the implementation of a waste air dechlorination (sodium hypochlorite) unit at a cost of Rs 50 lakh, a project for the recovery of barium sulphate from brine sludge at a cost of Rs 80 lakh. The installation of the latter is expected to substantially reduce the quality of brine sludge to be disposed of and lead to generation of nearly 1,000 tpa of barium sulphate—an additional value added product for the company.

For the year ended March 1994 the company has further improved its performance notching a net profit of Rs 8.4 crore on a higher net sale of Rs 77.8 crore.

MANGALAM CEMENT

Lower Government Purchases

Mangalam Cement, a company chaired by B K Birla, saw a 10.2 per cent fall in net sales in 1992-93. Severe restraints exercised by the government on its purchases affected cement prices while a sharp hike in the costs of coal, railway freight and power put pressure on margins. With government consumption accounting for up to 40 per cent of the industry's sales, the low government demand led to a fall in the price per bag of cement by Rs 10-20. Cement production and despatches by the company during the year were higher as compared to the previous year and stood at 3,92,416 mt and 3,96,052 mt, respectively, as against 3,88,258 mt and 3,85,973 mt in the previous year. With the continued problem of poor quality and inadequate availability of coal, the company was able to get just about 62 per cent of its linkage thus being forced to avail of the same from the open market at exorbitantly high prices. The sharp increase in operating expenses led to a 56.4 per cent fall in the company's operating profit. Despite a fall in depreciation and tax provision the company's net profit plummeted by 40.5 per cent over the previous year primarily due to the sharp rise in interest charges. Poor profitability forced the company to cut the dividend rate from 28 per cent last year to 20 per cent in 1992-93 (albeit on a higher equity base).

The company's new plant at the existing site has an annual capacity of six lakh tonnes. Trial runs of the crusher and the kiln including the ESP were taken in the month of March 1993 and the mills and packing plant were expected to be commissioned in the third quarter of 1993-94.

With the country yet to reach the take-off stage of economic development, the low per capita cement consumption of 60 kg against China's 240 kg, Thailand's 369 kg and the world average of 210 kg, shows the scope for enormous growth in demand. With total demand in the country including exports estimated to increase to about 80 million tonnes by the end of the Eighth plan, the cement industry is expected to perform well especially as it is being considered among areas of strength identified in the said plan. Further, as compared to the world production of 1,250 million tonnes, India's production accounts for less than 5 per cent. Major problems of the industry include a severe liquidity crunch in the market, a substantial cut back in government purchases of cement and infrastructure imbalance with regular steep hikes in the administered price of fuel, power and freight. Further, the rise in freight rates pushes up the price of coal and steel with the former leading to a consequent rise in the cost of electricity and all three pushing up rail operating expenses. This again justifies hikes in rail tariff which in turn push up the prices of coal, steel and diesel. This leads to a vicious circle of cost-push inflation.

The company's equity capital has risen from Rs 7.1 crore to Rs 11.4 crore following the offer of 42,67,038 equity shares of Rs 10 each at a premium of Rs 50 per share on rights basis in October 1993 in the ratio of three shares for every five held. For the year ended March 1994 the company earned a net profit of Rs 3 crore on net sales of Rs 60.1 crore.

Indian Steel Industry: Problems and Prospects

Arun Ghosh

One can understand the idea of introducing competition—which has incidentally shown up TISCO as a poor second to SAIL in recent years. One can even understand the government's reluctance to find budgetary resources for public enterprises. But why should SAIL not be allowed freedom to find ways of raising the resources required by it?

THE Investment Information and Credit Rating Agency of India (ICRA) has shown commendable foresight and enterprise in commissioning competent studies by experts, for the guidance of investors, investment bankers and other financial institutions (including commercial banks) in regard to the prospects and viability of new investments/expansions/modernisation programmes in selected industries/sectors, especially in the present framework of international competition. Indeed, as against the purely passive role of government (including the Planning Commission), leaving "the market forces to decide", the ICRA, under the leadership of former State Bank chairman D N Ghosh, has taken the initiative to inform potential investors (and investment bankers) as to the long-term prospects of investment in different sectors.

The report under reference*—the first of a four volume report dealing with different aspects of the Indian steel industry—is the second of the series, the first one being on Cotton Yarn (in regard to which there should be no question in anybody's mind as to the tremendous potential for new investment in India). The report on the Indian steel industry is timely, and attempts, so to speak, to take the bull by the horn. The Indian government generally, and the Planning Commission in particular, has for long years been quite schizophrenic, and of late quite negative, about public investment in the steel industry.

While one should await the other three volumes, on "the choice available and assessment of different iron and steel making technologies", the "issues relating to project management, skill enhancement and technology absorption in the Indian steel industry", and "issue of pricing, input-marketing and product-market interaction, private capital in steel and projected dynamics of steel industry in the deregulated environment", it is both possible and necessary, even on the basis of the first part study, to go into the problematique of public investment in the Indian steel industry.

* ICRA Sector Focus Series 2: *The Indian Steel Industry—Investment Issues and Prospects—* **Part I: Market Demand and Cost Competitiveness by Ramprasad Sengupta, 1994.**

One should start with two basic factual points. First, despite the extremely low productivity—in terms of blast furnace and steel melting shop productivity—despite the obvious overmanning that exists in the integrated steel plants, Indian steel production costs today compare favourably with international costs. The ICRA report cites the *overall* costs, in US dollar terms per tonne of finished steel, in 1992, in selected countries (see Table 1).

Two important points are noteworthy. First, the TISCO has, for all three years cited above, had the lowest cost of production of steel in the world. Secondly, and more importantly, the turnaround in SAIL has been remarkable; from being the highest cost producer in the world in 1973, in 1992 it was (after TISCO) the lowest cost producer, with the cost figure for South Korea not being available.

Rising Costs

The above rosy picture needs to be tempered by the fact—again, as per the data given in the ICRA report—that between 1982-83 and 1992-93, while the cost of production of steel has been steadily declining in other countries (in terms of costs in domestic currency), costs have been increasing in India. Table 2 points to a steadily declining cost advantage in India—which was obviously much more than made good by the devaluation of the Indian rupee *vis-a-vis* other currencies—and points to the enormous possibilities of further improvements in the cost of production of Indian steel. But the table also points to a steady improvement in the *relative* position of SAIL *vis-a-vis* TISCO.

Perhaps, at this juncture, one needs to take recourse to some other data—possibly to be provided in a subsequent ICRA report—which are germane to any study of the Indian steel industry. First, there is no doubt that there is overmanning in the Indian steel industry: the number of persons employed (in the integrated steel plants) per tonne of steel produced is several times that in industrialised countries. But two important points need to be noted in this connection. First, as per a 1991 ILO report, the labour cost per tonne of steel in India—as a percentage of the total cost—was the fourth lowest (after South Korea, Brazil and Japan); and the use of labour-intensive techniques in material handling and diverse other service facilities in steel plants is entirely unrelated to the relative inefficiency of the technological costs of steel production in India. To take but one example, blast furnace productivity is to be measured in terms of hot metal output per cubic metre (of blast furnace capacity) per day. This parameter varies in India from 0.58 tonnes per cm/day to 1.5 tonnes per cm/day. It is this which has steadily gone up in other countries, the rate having gone up from a little above 1 tonne to 2.4 tonnes in Japan. In China—with its relatively small blast furnaces—the figure varies from some 1.8 tonnes to 3.4 tonnes, with an average of some 2.4 tonnes.

Again, one needs to note that the quality of input has an important effect on output. If you use low grade iron ore or high ash coking coal, the proportion of 'slag' would be that much more, and iron that much less. But India has about the best iron ore in the world; and of late some one-third to 40 per cent of India's coking coal requirement has been met through the import of good quality, low ash content coking coal. (China has excellent coking coal by comparison.)

Hence, the low blast furnace productivity—earlier partly explained by poor quality coking coal—cannot any longer be ascribed to this reason. Blast furnace productivity depends on a large number of factors, including (and importantly) *uniform* input feed into the blast furnace (which calls for a proper, and uniform, blend of domestic and imported coking coal), proper temperature control (within the furnace), properly regulated 'top gas pressure', and a number of other technological parameters *all of which are the responsibility of the management.* Overmanning of the steel plants as a reason for high costs is a canard which has been spread by inefficient top managements, including management at the political level, to wit central government ministers, with proneness to interfere with the functioning of public enterprises.

The same goes for the 'tap to tap' time in the steel melting shop, for which there is room for considerable improvement in India. If both blast furnace productivity and the productivity of the steel melting shops were to be significantly increased, there would be a remarkable lowering of the real cost of production of steel in India. The facilities mentioned do not require enormous sums for investment; but increase in both capital outlay and in maintenance expenditure would without doubt be necessary. However, the resultant better utilisation of capacity would reduce the capital servicing charges very significantly. How important this can be would be seen from the data on works cost *vis-a-vis* financial cost in the SAIL and the TISCO, again, as per the ICRA report (Table 3).

Financial cost includes interest and depreciation, and head office expenses, etc, but *not return on capital.* But the mere fact that costs other than works costs were Rs 1,734 per tonne (of saleable steel) for SAIL (or 15.5 per cent of total costs) and Rs 1,767 for TISCO (or as much as 17.2 per cent of total costs) indicates that better capacity utilisation, through higher blast furnace and SMS output, opens up the possibility of significantly lower costs because even the works cost would decline significantly, as output per worker improves.

Demand for Steel

Perhaps three further points made in the ICRA report should be mentioned here before getting on to the implications of the ICRA study. First, the ICRA projects two scenarios for the growth of domestic demand for steel in India. It is best to reproduce the ICRA figures here (Table 4). It may be added that for the past the elasticity of steel consumption in India has been found to be 0.946 with reference to the Index of Industrial Production; 1.068 with reference to Gross Fixed Capital Formation; and 1.287 with reference to GDP (ICRA report, p 13).

To put it in common parlance, if the GDP were to grow by, say, 5 per cent per annum, steel consumption would grow by 6.4 per cent per annum; similarly, if the index of industrial production were to grow by 7 per cent, steel consumption would grow by 6.6 per cent. And if gross fixed capital formation were to grow by 5 per cent—the same as the GDP, i e, without any increase in the marginal rate of saving/investment—steel demand would grow by 5.34 per cent per annum.

Our estimates should be on the conservative side—especially since there is a crunch on resource availability—and it would be wise to adopt the *low scenario* growth rate of steel indicated. That is, one should expect steel consumption to increase from 15 million tonnes in 1991-92 to 26 million tonnes by 2001-02; and to 35 million tonnes by 2006-07.

In 1991, the main steel plants in India produced 12 million tonnes of finished steel. Secondary producers (including mini steel plants) produced 3 million tonnes. These are part of the datum necessary in the present context.

The second finding of the ICRA report is quite significant. World demand for and output of steel is increasing quite slowly, but the share of developed industrialised countries and of eastern European countries in this output has been declining rapidly. Per contra, developing countries have increased both their production and exports significantly. The increased demand for steel in developing countries is likely to be *mainly* by way of construction steel, though with increased industrial production, demand for other varieties of steel is also likely to increase. The ICRA report says, "The steel industry has substantive growth potential in developing countries" (p 36). Further, "Given the historically low export base of India's steel industry, the country has a considerable potential of expanding export volumes" (p 37). Finally, "Considerations of environmental issues can... play a major role in generating a further relocation of steel making capacity away from the developed world" (p 38).

Let us take a quick look at the data on actual steel output in some areas/countries of the world. Again, let us take the data contained in the ICRA report, this time relating to crude steel or ingot steel (Table 5).

In the share of world exports of steel, that of industrialised countries has declined from 78.5 per cent of the total in 1981 to 72.7 per cent in 1991; that of developing countries increased from 7.4 per cent to 16.2 per cent (p 18 of ICRA report). India exported 1.5 million tonnes of steel in 1993-94.

So much for facts pertaining to the Indian steel industry in relation to the world steel scenario. Let us now turn to two aspects of government of India policy in regard to steel.

Technology: Wrong Choice?

For the past four years, India has increasingly turned away from steel production in the public sector; and indeed has of late clearly announced that there shall be no investment for steel making in a greenfield site in the public sector. Of course, considering the possibilities of increase in productivity in the existing steel plants, one would wholeheartedly endorse the policy of modernisation-cum-expansion of capacity and output in the existing plants. Obviously, the scope for such improvements is enormous.

But the second aspect of the government of India's policy needs some comment, even though the second part of the ICRA report on technology choices is not yet available. Again, from 1991 onwards—perhaps even prior to that—the steel ministry has been partial towards the setting up of mini-steel plants based on the electric arc furnace (EAF) route.

There are (apart from minor technological variations) two broad technologies for steel production today: (i) the blast furnace-basic oxygen furnace (BF-BOF) route; and (ii) the electric arc furnace route. (Both can adopt continuous casting—or concast—technology for billet making, or go directly from the concast to a hot strip mill, or whatever; but that is not basic to the two entirely different technologies.) Let us take a look at the existing world capacity for steel making, using the two technologies (Table 6).

First, a word in explanation: the open hearth (OH) system of steel making is an outmoded form, now being replaced gradually by the basic oxygen furnace (sometimes known as LD converter). Also, as stated earlier, the continuous casting technology can be used in any process, and purports to save on energy in that molten steel is not first cast into ingots which cool off and which have to be reheated for further processing. The issue here is whether the BF-BOF or the EAF technology is better. And of late, with increased size, energy efficiency (through heat transfer) and other parameters, the EAF technology has been gaining ground because: (a) the BF-BOF technology today calls for a minimum capacity of some 3 million tonnes per annum, while the EAF technology allows much smaller plants to be viable, with a single product being rolled, making for capital and energy efficiency.

But there is a catch. The EAF technology works most efficiently with natural gas as the source of energy (while the blast furnace uses coking coal as a raw material, the coke oven and BF gases being used to provide the energy required for later processes, thereby making the process essentially energy efficient). In other words, where there is cheap and abundant availability of natural gas, the EAF technology has distinct advantages. But, worldwide, the BF-BOF technology continues to reign supreme, as the most efficient way of steel making (except for selected locations and for special steel production required in small quantities).

The government of India policy has so far led to the creation of some 7.5 million tonnes of EAF capacity, with an output of only some 3 million tonnes per annum. And, in view of the world steel scenario, the emerging demand for steel in India, the possibilities of steel export, there is obvious need for augmenting steel making capacity through integrated steel plants using the BF-BOF technology.

The government, being reduced to the status of a pauper, with no financial resources (and always looking for a nod from 'aid' givers) has now announced that the steel sector is open to private enterprise. But, considering the enormous infrastructure needed for setting up an integrated steel plant, there has understandably been no wothwhile proposal, the efforts of the likes of Biju Patnaik notwithstanding.

IISCO Story

One can, of course, understand the priority attached by the government to modernisation/expansion of existing facilities. But in one glaring case, the government of India policy has not only been inexplicable, it bears testimony to ineptitude, and smacks of motives which are neither transparent nor above board. The issue today is: what is to be done with the Indian Iron and Steel Company, a 'sick' unit with a notional capacity of one million tonnes, but with actual production of finished steel fluctuating between 300,000 tonnes and 400,000 tonnes in recent years, with a locational advantage, facilities and scope for being made the cheapest integrated steel plant in the country—provided all past investments are treated as sunk costs.

The history of the IISCO does not concern us here, but it is well to remember the reasons for its long (and continued) sickness. In the mid-60s, the IISCO made a large, but impractical investment of moving its coal requirements from its captive mines at Chasnalla to Burnpur by an overhead ropeway system. The investment—made in order to make IISCO independent of the uncertainties of the railway transport system—was ill-advised, it was not only costly (increasing the real cost of coal transport) but also impractical; the 65-mile long overhead ropeway movement passed through private fields from which only the space (and the right) required for the transmission towers supporting the ropeway had been acquired. The coal filled trollies moving along the ropeway could be easily tilted by a long bamboo pole; and this soon became the procedure by which villagers along the route could obtain their coal supplies. This meant loss of valuable coal through daylight theft. The devaluation of the rupee in 1966 led to an unexpected increase in the cost of the Chasnalla project which was financed by a loan from the World Bank. The investment was clearly ill-advised and based on 'pique'—a 'to hell with you' attitude to the railways—because the IISCO was still totally dependent on the railways for supplies of iron ore from its captive mines at Chiria, and also for diverse other raw materials, as well as the transport of finished products.

The investment proved costly in other ways too. With the abolition of the Managing Agency system in April 1970—and bereft of support from Martin Burn—IISCO was suddenly strapped for cash. By 1971-72, IISCO's outstanding loans had become Rs 35 crore, and the interest burden was heavy. The price of steel was controlled, and government did not feel there was any justification for raising the steel price. Nor did the central government agree to any rescheduling of debt. In July 1972, the management of the IISCO was taken over through an Ordinance; and while the necessary legislation was to be enacted, the reason stated in parliament for the acquisition was that "investment of a large amount is necessary for the maintenance and development of the production of the undertakings of the company"... for which "acquisition by the central government of an effective control over the affairs of the company is necessary to enable it to make the investment". The government of India finally nationalised the IISCO by paying a compensation—to the shareholders—of Rs 12.6 crore. In 1988, the entire shareholding of IISCO—the paid-up capital raised to Rs 273 crore by then—was held by SAIL, though the IISCO continued to be a separate company with its own board of directors.

But the required investments (for the modernisation of IISCO) were never made; and the way the IISCO was handled, can only be described as cavalier. Incidentally, in 1971-72, prior to take over and subsequent nationalisation, the IISCO produced 910,000 tonnes of hot metal and 842,000 tonnes of saleable steel.

How the government of India has managed the affairs of the IISCO would be clear from the following brief facts. Between 1972 and 1982 (when the present writer visited IISCO in his capacity as the chairman of the BICP, with similar visits to all integrated steel plants preliminary to finalising the BICP (1982) report on the steel industry), the managing director of the IISCO had been changed seven times. There was neither any continuity of policy, nor indeed any policy. In 1982, the Burnpur plant operated with steel converters by way of Duplex with Bessemer converters—apparently, they still have them—which are reminiscent of 19th century technology. The sheet plant was a manually-operated one, with workers drawing out red hot sheets with tongs held in gloved hands. The coke ovens leaked profusely, and workers were operating the ovens from the top, manually adjusting the doors to minimise leakages. The overhead cranes looked as if the structures might collapse any moment—such was the vibration—and the entire Burnpur plant (as well as the Kulti Iron Works) reminded one of working conditions in Dickensian England.

And yet the dedication of the workers was such that in 1981-82 IISCO produced between 500,000 and 600,000 tonnes of finished steel—I do not off-hand remember the exact quantum—and in 1991-92 IISCO, with a production of 372,000 tonnes of finished steel, still showed a (small) cash surplus.

The BICP found, in 1982, that the location of the Burnpur plant of the IISCO was the best among all integrated steel plants in India. It was located at the junction of the Eastern and South-Eastern Railways: its captive iron ores mines at Chiria (on the S-E Railway) were not too far away and the quality of iron ore was excellent; its captive coal mines at Chasnalla were also not too far away (though subject to coal thefts from the ropeway system); it was close to the main market of Calcutta (with a concentration of engineering industries); and despite its obviously low productivity arising from thoroughly outmoded, inefficient plant and equipment, in certain areas of cost it compared favourably with the better and more modern integrated steel plants.

The BICP then felt—and this recommendation would hold good even today—that

Table 5: Shifts in Regional Structure of the World Steel Industry

(million tonnes)

	1981	1991

the IISCO deserved to be thoroughly modernised and its capacity expanded.

SAIL Sidelined

What is the present status of the IISCO? SAIL has prepared, from time to time, diverse plans for the modernisation/expansion of IISCO; but these plans were all rejected by the steel ministry. Though SAIL is the owner of IISCO, it is really run by remote control from Delhi; as a consequence, it is virtually not run at all. To cut a long story short, in June 1992, the ministry of steel appointed a committee of experts (COE) "for obtaining and evaluating offers for private participation in IISCO, negotiating with the parties and for recommending the party and the terms of its participation, prioritisation, if necessary, and suggesting other conditions including financial restructuring..." The terms of reference added that the "The objective of seeking private participation is implementation of the modernisation of the existing steel-making facilities in the Burnpur steel works of IISCO, which have a capacity of 0.37 million tonnes per annum of crude steel, to make it a viable unit and to expand the capacity to a minimum of 1.5 mt pa of crude steel." Times change; one has to compare the above policy statement with the one made in parliament at the time of acquisition and nationalisation of the IISCO.

Again, to cut a long story short, only three points need be made here. First, since nationalisation, the cumulative loss of IISCO over a period of 17 years (from 1975-76 to 1991-92) amounts to Rs 945 crore. (As indicated earlier, in 1991-92, the IISCO made a small cash profit, but the capital servicing charges—interest on government loans to meet past losses—converted the cash profit to a net balance sheet loss of Rs 8 crore.)

Secondly, the Parliamentary Standing Committee on Industry's Report on 'The Public Sector Iron and Steel Companies (Restructuring) and Miscellaneous Provisions (Amendment) Bill, 1993, submitted in April 1994, has this to say (on the IISCO):

> 15.1. The committee finds that the terms of reference set out for the Committee of Experts were limited enough to restrain that committee in recommending concrete proposals for modernisation of IISCO. In fact government should have asked the committee to suggest all alternatives instead of concentrating on scrutiny of bids in the global tender for private participation.
>
> 15.2. The committee finds that at no stage SAIL has expressed its inability to undertake the modernisation programme of IISCO and in fact SAIL has not been extended the required funds for the purpose during all these years despite its viable proposals submitted to the government time and again and this fact has been corroborated by the finance secretary...
>
> ...The committee is thus not convinced with the government's approach in rejecting the proposals made by SAIL...

There is a third aspect of the problem which needs to be highlighted. Trade unions—in fact, all of them jointly, irrespective of party affiliations, involving the INTUC, CITU, AITUC, HMS and BMS—and the Officers Association of the IISCO have claimed that the present worth of the assets of IISCO would be not less than Rs 12,000 crore, counting the assets in Burnpur, Kulti works, collieries, iron ore mines, not counting other assets like the IISCO House in the centre of Calcutta, housing the headquarters of IISCO (*vide*, Jibon Roy, *IISCO Modernisation: What? Why? How?* A SWFI publication).

Level Playing Field?

It is in the context of the overall world steel demand, the long-term advantage of India in steel making, the comparative costs of different technologies/methods of steel production in India, and the efficiency (or otherwise) of different types of steel producers in India, that a decision needs to be taken in regard to what should be done with a unit like the IISCO.

Over the past three years, SAIL has exhibited a remarkable turnaround; it has recorded increasing net profits and the last balance sheet shows—after appropriations to depreciation and to reserves—a net profit exceeding Rs 500 crore. SAIL has also exported nearly a million tonnes of steel in 1993-94.

It is puzzling as to why the government—if it is strapped for resources (because of its own counter-productive fiscal policies)—cannot or does not hand over total responsibility for IISCO to its rightful owner, SAIL. Indeed, reportedly, the government is now planning to refer the IISCO to the BIFR (the Bureau of Industrial and Financial Reconstruction, which has been rechristened by wags as the Bureau of Industrial Funeral Rites).

Is it merely an ideological aversion to the concept of public enterprise, or are there other, deeper reasons for trying to hand over the IISCO to some private party (which has neither the funds nor the organisation nor even the technological or managerial expertise to handle the problems of IISCO)?

Why and wherefore has this sudden aversion to public enterprise arisen between 1992 and 1994? One can understand the idea of introducing competition—which has, incidentally, shown up TISCO as a poor second to SAIL in recent years—one can even understand the government's reluctance to find budgetary resources for public enterprises. But why should not the proceeds of the sale of equity of public enterprises be made available to the public enterprises? One is not certain about the extent to which SAIL shares have already been disinvested, much against SAIL's will, at throw away prices in relation to the value of SAIL's assets or the prospects of its future profitability. Why should SAIL not be allowed freedom to find ways of raising the resources required by it?

And, with reference to the superiority of 'market driven' investments, enormous investments in the petrochemical sector—funded in the main by public financial institutions like the IDBI, UTI and similar agencies—are taking place, in the private sector, all with a nod from the north and south blocks of New Delhi; but these sources are not available to public sector steel plants, public sector power plants (like the NTPC). Two or three years back, Vijay Kelkar (then chairman of the BICP) wrote a long report for the Asian Development Bank; and he found that the engineering industries had long-term comparative advantage for India; the petrochemical industries did not enjoy the same comparative advantage.

One need not go into that issue for the moment; but one is surely entitled to ask two questions. First, if competition be the objective of the economic liberalisation programme, do we really have free competition? Do we have equal rates of import duty on synthetic fibres and steel? And, would the financial institutions not be barking up the wrong tree in financing heavily protected industries in an economy which is intent on liberalisation? Secondly, in the name of liberalisation, are we really creating a level playing field—a phrase much used by government spokesmen—for both public and private enterprises? Or are there opportunities of 'rent seeking' for those in power, in the process of privatisation?

The IISCO case certainly raises this issue in a somewhat vivid manner. There is always a taste of honey in any large-scale asset transfer.

Table 6: Crude Steel Production and Casting by Processes, 1991

New Telecom Policy

Rushing In Where Angels Fear to Tread

P Purkaysatha

Fragmenting the existing physical telecom network or building parallel networks in the name of competition is a disastrous policy prescription at this stage of the country's development. Given our immediate development targets and scarce national resources, a rational policy should have looked at the basic issues confronting us—how to provide cheaper telecom access, rural telephone services and modern data communication to industry. Instead we have an ideology-driven Telecom Policy that addresses the 'need' to privatise the telecom network rather provide for its expansion at optimal cost.

THE New Telecom Policy announced by the prime minister after a bitter controversy between the chairman of the Telecom Commission, N Vittal, and the union communications minister, Sukh Ram, is supposed to facilitate India's advance to a world class telecom service. Instead, the policy has all the hallmark of the current government—the lack of a clear-cut policy framework and *ad hoc* decision-making. No wonder the former chairman of the Telecom Commission, D K Sanghal, has called it "a set of confused steps created by a bunch of confused people". It is unfortunate that the Power Policy of the government which has drawn a barrage of criticism from experts for similar reasons has not taught any lesson to the government. In many respects, the Telecom Policy is even more muddled than the Power Policy.

The policy has really two sections—one, a set of desirable objectives and the other, the instrument to achieve the same. The goals set out are: telephone connection on demand, all villages to be covered, and a world class service at an affordable and reasonable price. All this is to be achieved in the next three years, i e, the end of the Eighth Plan period. With these objectives, the Eighth Plan targets have been substantially revised upwards, needing an additional investment of Rs 15,750 crore over the original planned investment of Rs 25,000 crore. And then the final *coupe de grace* of the policy—"Clearly this is beyond the capacity of government funding and internal generation of resources, private investments and associations of the private sector would be needed in a big way to bridge the resource gap." We have the now familiar TINA syndrome 'There Is No Alternative' but to invite multinationals and the private sector in the basic telecom services. This is the instrument finally to be adopted for achieving the revised targets.

The interesting part of the policy is not what it says but what it does not say. The policy nowhere identifies the basis of the upward revision of demand nor the mechanism through which the private sector or the foreign sector can participate in the basic telecom services. As we shall see later, private participation in basic telephone services is of recent origin globally and multiplicity of operators as the policy advocates is practically non-existent. The technical as well as the commercial problems involved with multiplicity of operators in a network are quite formidable. However, the government's policy paper does not even address such issues. We are now told that a committee will examine the modalities of how the policy can be executed. Any sane government would be expected to work out the modalities of the policy before choosing its policy options. Unfortunately, this government seems to believe otherwise.

Immediately after the announcement of the policy, it was stated in various fora that the existing network belonging to the Department of Telecom (DOT) would not be privatised. This was stated by Sukh Ram also in his meeting with the senior officials of the department. However, the current portends are that various parts of the network will be parcelled out to various private or multinational operators. Alternatively, parallel networks would be built by the private operators duplicating the existing DOT network.

Today (1993-94), the waiting list for telephones has reached about 25 lakh on an installed basis of about 80 lakh (New Telecom Policy figures). In the first two years of the Eighth Plan, 19.5 lakh new lines had been added and an additional 55.5 lakh lines would have been installed by 1997, as per the original Eighth Plan targets. This would have meant that not only the people on the current waiting list would all be provided for, but an additional 25.5 lakh as yet unregistered consumers would also have been taken care of. However, without any substantiation, the new policy projected that the number of unregistered consumers is likely to be much higher—of the order of 50.5 lakh in the next three years rather than 25.5 lakh. This would mean an average yearly registration of nearly 17 lakh as against the current yearly figure of about 9-10 lakh (1993-94 figures were only 8.5 lakh). And according to the new policy, for this rather dubious demand, a further investment of Rs 11,700 crore is required in the Eighth Plan itself.

From the accompanying Tables 1-3 a projection based on actual growth of total registered demand will show that if the Eighth Plan targets are met, the waiting list will be wiped off almost entirely. Therefore to provide a telephone on demand, no such drastic change in policy is called for. To circumvent this uncomfortable fact, the new policy talks of a pent up demand that will suddenly explode if more lines are available. No evidence has been advanced for such wild projections of pent up demand. However, the entire argument on shortfall of resources really hinges on this fictitious demand projection.

The target for expansion of the rural network has also been stepped up considerably. The original Plan target was another 1.5 lakh villages to be covered by Long Distance Public Telephones (LDPT) bringing up the total villages covered to 3.6 lakh by LDPT, that is an addition of another 2.1 lakh villages to be covered in the Eighth

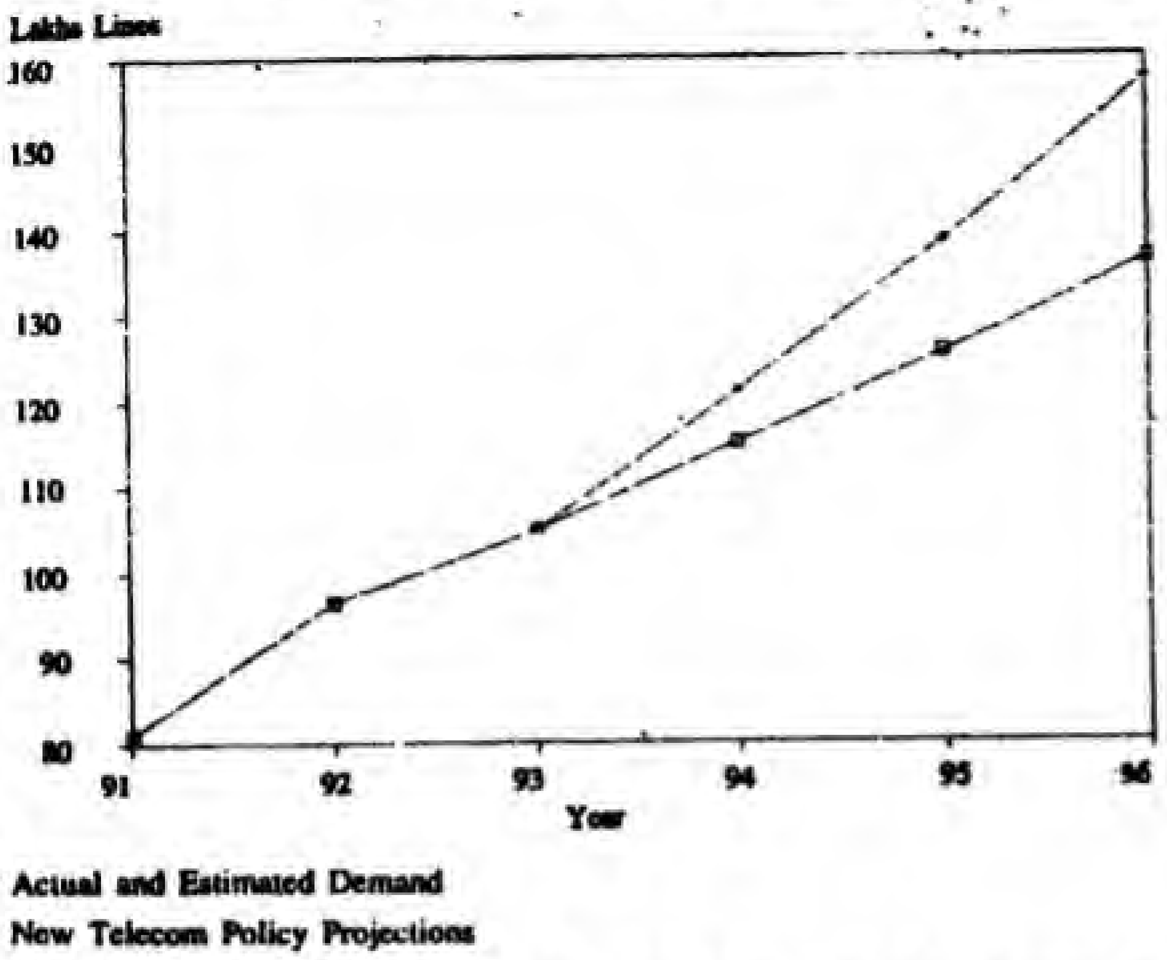
Note: The new registrants for 1994-95 to 1996-97 have been estimated by projecting registered demand on a time scale.

CHART: DEMAND PROJECTIONS FOR EIGHTH PLAN



Plan itself. The target here is certainly a worthy one. However, the problem of the rural network has not been one of coverage but the quality of coverage. A technically sound and cost-effective solution to the rural telephone network would probably demand a variety of technological options. In the absence of this, the rural connections would will have little value as borne out by a Department of Telecom sample study that showed 61.3 per cent of such rural connections would not to be working due to technical malfunctioning of the system. The new Telecom Policy unfortunately makes no attempt to address these problems but only advances the argument that all villages should be covered requiring an additional investment of Rs 4,000 crore.

The new Telecom Policy also suggests that there is already a shortfall of Rs 7,500 crore in the resources required for the Eighth Plan. However, again this remains a mere assertion as no shortfall in the targets of the Eighth Plan has yet taken place nor has any budgetary support been asked for from the government for the expansion of the telecom sector. Ironically, the DOT's tender for leasing drew a response of Rs 7,000 crore from the equipment manufacturers making nonsense of the government's claims of a shortfall of resources. Today, the cost of installing a line is Rs 47,000 while the annual revenue from the same is Rs 10,000. Obviously, raising capital from the market is no constraint for the telecom sector. It is because of this that the entire telecom expansion for the Eighth Plan is projected to be financed from internal resources and market borrowings—a target DOT has been able to maintain in the first two years of the Plan. Even if additional resources of Rs 15,750 crore—Rs 11,750 crore for direct lines and Rs 4,000 crore for the rural long distance lines—had to be raised for the expansion of the network as argued by the new policy, there is no evidence to suggest that DOT would have been unable to do the same.

It is interesting that in the Sixth Report of the Standing Committee on Communications (April 1994, Lok Sabha Secretariat), the Department of Telecom took a very different view of its resource position. The report states quite unequivocally that in the first three years of the Eighth Plan, the resources raised by DOT are of the order of Rs 17,000 crore and DOT would raise a total of Rs 34,000 to 35,000 crore for the Eighth Plan on its own. Taking into account the additional Rs 7,000 crore raised through the leasing tender noted above, the total resources that DOT is projected to raise in the Eighth Plan itself is of the order of Rs 40,000 to 45,000 crore. Therefore the argument that additional resources would be available only from private sector is shown to be false from the government's own records.

The question might still be raised why should one oppose the entry of private sector in the basic telephone services of the country. People are understandably frustrated by DOT's inertia, its indifference to the consumer and the snail's pace at which value added services required for today's global business are being provided. Coupled with this is the mess in radio paging and cellular tenders that are delaying these services even further. The answer really lies not in any love for DOT, but the nature of the telecom sector.

Traditionally, telecom has always been a monopoly the world over. This is because

of the need to lay physical lines and therefore the 'right of way' legislation that had to be created to facilitate this. The local loop required laying down cables in urban areas, cutting across roads, sewage, and water lines. In most countries it was a government monopoly, as communications was also considered a security issue related to the defence of the country. In US and Canada, it was a private monopoly—the famous Ma Bell or AT and T. Generally, even where private operators were allowed, this was restricted to one company in a given area, though more than one operator could theoretically operate in a given country. As local carriers had monopoly in their area, they did not allow any external carrier to come into their network. The result was a completely vertical monopoly with local as well as trunk services being concentrated in one single company. Till 80s, each country had virtually one carrier—either as a deliberate policy or as a result of market forces.

The 80s saw a shift in this sector. Primarily, the shift came due to two reasons. It was increasingly seen that the telecom network was the key to future information technologies and also to entertainment—video and cable channels. A monopoly over the physical network would cede unacceptable future control of these sectors to the companies owning the network. The second reason is the innovation in this area. This has resulted in a variety of technologies coming into existence making possible 'technological' competition. It is now possible to have a local loop either through wireless or even a cable network, apart from the telephone line. The telecom scenario has thus been undergoing rapid transformation, particularly in the last decade, when selective competition was introduced in the basic telecom services. It must be emphasised here that the selective competition was introduced only after a network had attained a certain size and traffic volume. Even then, contrary to the myth beihg freely propagated, the competition that can be or has been introduced in the system is limited. As can be seen from Table 4, only five amongst the 19 countries that have introduced privatisation allow competition in the local loop and only six allow competition in the trunk routes. And even here the carriers are restricted to two or at most three. This may be contrasted with the current policy of allowing 30 or more telecom local network operators.

This is where the new policy is likely to do the maximum damage. As per the new policy, a multiplicity of operators is envisaged even in the local loop. For a country short of resources, this is an extremely wasteful option. The technological efficiency of expanding the network is overwhelmingly in favour of one operator only for the local loop. Competition has been introduced in a few countries in the west for the trunk routes, and while it is not as wasteful in terms of duplication as competitive local loops, it is still a luxury for a developing country like ours. However, a decision on the level of competition that can be allowed on the trunk route can be taken after a careful consideration of the volume of traffic and the cost economics of the same. The value added services that can be configured on the existing network can and should be thrown open to competition for a rapid development from different sources and should be freed from the stranglehold of DOT. If the government is even half-way serious about liberalisation, this is the first step that needs to be taken.

Sukh Ram has proudly stated in a recent press conference that we are even ahead of Germany and France in introducing competition in telecom services. Most EEC countries are not introducing either privatisation or competition in the basic telecom services in the near future. This is in spite of their telephone density and traffic volumes being far higher than ours. Instead of making such claims, the minister would be better employed examining the reasons why France and Germany do not propose to introduce competition in the basic telecom services.

A rapid development of basic telecom services is a prerequisite for today's world. Unfortunately, ideological issues like privatisation are continuing to cloud the outlook of the policy-makers. The issue of introducing competition in the telecom network is different from that of privatisation. About 15 countries have privatised their telecom network—they have converted their erstwhile government departments to corporations that have sold shares to the public. This does not introduce competition. What the government is now proposing is that different parts of the telecom network will now be owned and operated by different owners, and more than one operator may exist in one given area. This concept of a telecom network with multiplicity of operators and owners is unknown globally, let alone on a telephone density of 0.9 per 100 as we have. As south Korea is generally considered to be role model of privatisation, it is worthwhile to note what it has done. South Korea is spending 13.45 per cent of its GDP on telcom while only 2 per cent of the telecom services are privatised. We, on the other hand, are spending only 2.5 per cent of our GDP on telecom while we introduce privatisation for the network. A world class economy cannot be built without public investments in basic infrastructure, a course we are extremely loath to take.

A rational policy framework would allow for competition where such competition will benefit the consumer as well as retain the technical efficiencies and economies of a unified network. If competition has to be introduced, it can be done by using a competitive technology like wireless—e g, fixed radio or cellular telephones. Even though it would be more expensive than the telephone cable for the local loop, it would not be a wasteful duplication. However, fragmenting the existing physical network or building parallel networks at this stage of development is a disastrous policy prescription. Given our immediate development targets and scarce national resources, a rational policy option should have looked at the basic issues confronting us—how to provide cheaper telecom access, how to provide rural telephone services and how to provide data communication to indian industry. Instead, we have an ideology driven policy that addresses the 'need' to privatise the telecom network rather than provide for its expansion at optimal cost. A cure quite distinct from the disease.

Maharashtra: Politics of Culture

'Rajarshree Shahu University (Pune)'

Gail Omvedt

The Bahujan Samaj Party's demand, raised at a seminar in Pune at the end of last month, to rename Poona University after Shahu Chhatrapati is a political one which takes its significance from the entire history of caste relations in Maharashtra, most particularly the troubled connections and contradictions between the social movement and the national movement.

ON July 27 in Pune, before an enthusiastic crowd of thousands, BSP leader Kanshi Ram gave a new slogan: Give Poona University the name of Rajarshree Shahu Chhatrapati, the Maharaja of Kolhapur, who as the heir of Shivaji and ruler of the largest princely state in the Marathi-speaking region, was the main supporter of the non-Brahman movement in the early 20th century. The demand climaxed a three-day seminar on the subject.

The thought of renaming another university—indeed of bringing such 'renaming' issues straight into their own territory—is very likely to evoke a massive response of weariness and antagonism among Pune progressives. Reactions have ranged from 'why can't they take up the basic economic issues?' to 'if you want to have a mass response, why not hold a seminar on the bhakti movement?' Resistance to the demand is indicated by the fact that not even sympathisers from Poona University itself dared to come to the seminar. In its turn, the BSP is going ahead planning nearly 1,500 symposiums and public meetings in the state (five in each assembly constituency), without much concern for the response of the Pune elite.

Clearly the demand is a political one, and it is on political grounds that it should be judged. But these political grounds take their significance from the entire history of caste relations in Maharashtra, most particularly the troubled connections and contradictions between the social movement and the national movement. And they have a context today in a situation in which once again the left has been sidelined in Maharashtrian politics and it is only the forces of 'Hindutva' (leavened by the anti-corruption campaigns of the RSS-admiring Khairnar and Anna Hazare) who are otherwise challenging the Congress. 'Rajarshi Shahu University' is in fact a demand designed to challenge both and to bring forward, at this point on the issue of 'identity', a different alternative.

WHO WAS SHAHU?

Phule's name has by now become established; Shahu's remains little known. Yet, he had a central importance of his own as the person who aided the non-brahman movement and Satyashodhak Samaj to take on a mass following in the 20th century, and it was not without reason that when I had done my dissertation on this decades ago, my then-guide, Thomas Metcalf (a scholar of the taluqdars of Oudh) remarked, "Actually I find your Maharaja even more remarkable than Phule. One can understand radicalism from a man himself coming from a low-caste peasant background—but for a ruling prince to take the positions that Shahu did was quite surprising."

Shahu's contributions in Kolhapur state itself, which he ruled until his death in 1922, centred on bringing forward all sections of the bahujan samaj. He was the inaugurater of the reservations policy in India, proclaiming in 1902 that 50 per cent of new state employees should be from castes "other than Brahmans, Prabhus, Shenvis, Parsis and other advanced classes"—and this was the issue which brought him into conflict with the brahman community which had gained a stranglehold over the state administration during British rule. He sponsored a series of hostels for students from nearly every community, including untouchables, Muslims and Jains; these were not limited to the students of that community, and Latthe, author of the most authentic memoirs on his rule, remarks about the irony that whereas the brahmans founded hostels with 'universal' names but in fact limited to one community, the non-brahman hostels, identified with particular communities, were in fact much more open. Though he maintained purdah standards in his own family, other backward caste girls were provided with educational facilities, and he promulgated one of the first laws legalising intercaste marriage and later himself took the concrete step of arranging a marriage between his family and the (Dhangar) Holkars of Indore. He fought untouchability in one of the most practical ways in his own period: sponsoring a tea-shop owned by a Mahar, he himself stopped there on his return from his frequent hunting expeditions, and not only took tea himself but also forced the Maratha sardars accompanying him to do so. The greatest tribute to Shahu was in fact paid by Ambedkar himself, not simply in words but in actions when he rejected all the approaches of brahman reformers and brahman nationalists to make his entry into the political life of Bombay presidency under the patronage of the Maharaja.

Shahu's efforts at economic development in Kolhapur contain the seeds of an alternative developmental model, which in many ways had its origins in Phule's writings on agricultural development. The background to this lay in his style of rule: as the British themselves testified, he was an Indian prince more accessible than any other (certainly more accessible than the alien British) to the people he ruled. Shahu not only loved hunting, he enjoyed wandering in the villages, talking to the peasants, looking at and learning from the efforts being made by local people themselves to provide drinking water, to start small enterprises. (A B Latthe, in his *Memoirs of His Highness Shri Shahu Chhatrapati, Maharaja of Kolhapur*, gives an example of Shahu's noticing in one village a small factory for manufacturing 'catechu', a forest product, and trying to replicate it.) On all his trips, whether in India or in England and Europe, he took a special interest in agriculture, animal husbandry and agriculture-related industries.

The developmental efforts Shahu made in his state, then, focused on these. He experimented with tea and coffee plantations in dry areas, with silkworms and local products such as the Indian aloe, an effort to give more income to peasants in the poorest regions. He sponsored sugarcane and its processing; even today Kolhapur remains a centre of some of the best jaggery in India (the traditional alternative to white sugar which has its own demand and even export market, but foolishly looked on with heavy disfavour by the Narasimha Rao government). He helped found a textile mill which became state-run after its original management failed. (Indeed, he had also been ready to support the swadeshi experiments of Tilak's followers before the fight with the brahmans became too intense.) He tried to push non-brahmans into industry also, founding an industrial school mainly oriented to the Jingar community.

Thus there was a dual emphasis to his economic policy. On one hand, he supported non-brahmans, dalits, Muslims and other minorities—the bahujans of his day, though the term was only beginning to be used—in breaking through traditional caste barriers not only in terms of gaining entry into employment, but also in industry and commerce, which he saw as the necessary base of any modernity. And secondly, there was a different emphasis in the developmental programmes themselves. In contrast both to the 'Nehru model' (with its emphasis on centralised heavy industry, state ownership and planning under a high-caste dominated state machinery) and Gandhism (with a decentralised and village-oriented approach, but one with heavy overlays of traditionalism and rejection of modern science and technology symbolised in the term 'Ram raj'), he supported a form of development that was centred on agriculture and support for small industries (in most cases linked to

processing of agriculture and forest products) but sought to make use of modern technology. It was this overall approach that participants in the BSP seminar were beginning to talk of as 'bahujanwadi economics'.

SHAHU AND PUNE

But this role in the non-brahman movement, and his accomplishments in Kolhapur state, still do not answer the question which many were raising: Why Poona University? It is here that the most interesting and politically charged historical background exists.

Shahu was in fact the founding president of the Deccan Education Society, the premier indigenous educational institution in the state, whose first college was the famous Ferguson College with many coming after that—an educational work that lay the foundations for the later university. Though the overwhelming majority of professors and students in these colleges were brahmans, Shahu continued his association and financial support even after the bitter disputes broke out, and even today his heir remains the president of the Society. Yet there was little real interchange, and the 100th anniversary souvenir of Ferguson College fails to carry even a photo of Shahu among the nearly 50 that adorn its pages.

These facts themselves give some idea of the gap that grew up and remained between brahmans and non-brahmans.

In fact, it was on the whole natural that the upper castes with a literary tradition should be the first to get western education. It was also natural that they should try to broaden their efforts, and in particular look to the rulers of the major princely state in their region, the one which symbolised the glories of Maratha history, for support. Thus the Poona Sarvajanik Sabha, predecessor of the National Congress, had welcomed Shahu's accession to rule. Further 'natural' developments should have seen an alliance between the social reformers and lower castes struggling for upliftment and the gradual extension of education and employment to the broader masses of people. Latthe has put it this way: "If [the reformers] had cast their eyes towards the non-brahmans who required reform for their very existence and were therefore wedded to liberal and democratic ideals of social life, if they but realised what potentialities lay within the Satyashodhak or Vedokta movements whose only *raison d'etre* was an aspiration towards a higher life, if they could but imagine what currents were struggling upwards to the surface of the sea of the non-brahman masses...they could have guided the social movements of their earlier Gurus like Ranade and Agarkar into a vigorous and successful national movement" (p255).

But they did not. The non-brahmans and dalits had to wrest their advances in education and employment and their recognition as human beings with capabilities in every field from a brahman elite which appeared to be unwilling to surrender even an inch. History took a very specific course, in which a defeat of the progressive brahmans preceded the more bitter and long-drawn fight between radicalised non-brahmans and the orthodox brahmans now coming forth as nationalists under the leadership of Lokmanya Tilak. Agarkar died; Ranade proved weak in relationship to Tilak both politically and in terms of maintaining his own principles. Reformist brahmans began to be denounced as 'anti-national' for trying to use British support for reforms such as stopping child marriage; some reformers were even beaten up, and the Social Conference was banned from holding its meetings in the National Congress grounds. By the end of the 19th century this triumph of what was later to become 'Hindutva' among t' 'nationalist' leaders was fairly complete, and the issue was posed in the way it should never have been: social reform first or political reform first?

To the non-brahmans, the meaning of this was clear. By resisting every effort to bring forward non-brahmans in employment, the elite seemed to be insisting on its right to monopolise knowledge and power. (Significantly, though Tilak himself was known as 'lokmanya' and described as the 'leader of Telis and Tambolis', when members of 'low' castes themselves began to enter the legislative council in the 1920s, Puneites mocked them with 'Telis and tambolis are sitting in the council'). And, by resisting Shahu's efforts to win Vedic rites from the priestly community in Kolhapur and stamping him and his lineage as 'shudra', they were clearly proclaiming the inferiority of all non-brahman sections.

The issue of giving Shahu's name to the university can thus be seen as a rectification of a historical wrong and a reforging of a progressive alliance against social conservatism.

FIGHT AGAINST HINDUTVA AND 'BRAHMANISM'

There are interesting similarities between Shahu's time and ours. Today also there is a growing Hindutva force, using slogans of nationalism and swadeshi to fight what is, in this case, a corrupt ruling party claiming the heritage of Indian nationalism. There is, even more than in Shahu's time, an aggressive rising political force of the 'bahujans' which sometimes seems to take extremist turns in its hatred for casteism.

But the progressive intellectuals have been trying to fight Hindutva with, on one hand, the slogans of secularism, and on the other, by invoking the 'bhakti-sufi' traditions of Hindu reform and Hindu-Muslim unity. The left also is trying to talk about reformist Hinduism, Vivekananda and the like. This has not done it much good—either in 'muktanad' or in the UP elections.

In the 19th century also, the Prathana Samaj and its leaders identified with the bhakti movement in Maharashtra. But it did them little good. Certainly it was not enough to combat the conservatives. The progressives' failure lay in their unwillingness to make an alliance with the numerically strong and much more radical Satyashodhak movement. The sentiment at the BSP seminar regarding the bhakti movement was clear—and striking. They are its sympathisers, but speakers argued that saints from all castes could only have come forward after Muslim rule had broken the political power of brahmanism. The attitude towards Muslim rule is strikingly different. The social conservatives try to use the bhakti movement and other religious reformers with an anti-Muslim bias; the entire tradition of the non-brahman movement, in contrast, has always included Muslims as a part of the bahujan samaj.

The history of the Deccan Education Society concludes with a remark that "One of the serious complaints against the system of education which has prevailed in this country for over a century is its entire un-Indian character. Students know more about Shakespeare and Milton than about Vyas or Valmiki. It has neglected India's tradition and culture" (K G Pandit, *The Deccan Education Society, 1885-1960*, p 114). But what the BSP has been posing is the question of exactly what and whose is this tradition and culture. They have no quarrel with the notion of recognising a cultural identity, but a very strong quarrel with the proponents of Hinduism as to what this identity is.

There is one final aspect of the BSP's version of 'bahujan' politics that comes forward clearly in the demand for taking Shahu's name. That is of course the recognition of the Maratha-Kunbi community as a major part of the bahujan samaj. While normally characterised as a 'dominant caste' now in political power, Kunbi-Marathas make up one-third of the Marathi-speaking population and by no means can be said to be in power as a caste; the few academic analyses that talk of 'Maratha power' (for instance, the thesis of Jayant Lele) do so by making a rather untenable separation between 'High Marathas' and common Marathas. It is in the broad concept of bahujan that the BSP differs strongly from its hitherto contender for the bahujan wave, the Prakash Ambedkar-led Bharatiya Republican Party/Bahujan Mahasangh. The Bahujan Mahasangh had included only non-Maratha 'OBCs' as bahujans. The BSP, in contrast, continues to have largely dalit leadership, though there is still a weak response to it from the highly politicised and factionalised Buddhist (ex-Mahar) community of Maharashtra and its main base in the state is said by Kanshi Ram to be among the Muslims. Now it is bidding for Kunbi-Maratha support. Putting together the 'dalit-non-brahman' alliance once again would appear to be tricky and contradictory to the arguments of most progressive intellectuals that it is precisely between the 'dominant castes' and dalits that the main contradictions lie. But it is consonant with the historical unity that Phule, Shahu, Periyar and Ambedkar himself had tried to build against brahmanism.

An Open Letter to Taslima Nasreen

Habibul Haque Khondker

There are many in Bangladesh who condemn religious bigotry and discrimination against minority and other oppressed groups. They may not be in the limelight but they are there.

WHEN I read your *Lajja* some time ago, before it generated all the controversy, frankly, I did not find it to be a great piece of literature nor did I find it offensive. Yet I read it because of your reputation which did spread far and wide even before the eruption of the recent controversies. In *Lajja* I liked the psychological twist of revenge from a Freudian angle; what I liked most in that book, however, was your ideological position. I was happy to see a courageous voice in favour of the minority Hindu community in Bangladesh. As a fellow Bangladeshi and one who is steeped in the ideals of humanism, democracy and secularism, I found in you a kindred soul. It is always heartening to see if a member of the 'majority' community speaks up in favour of the 'minority' community.

I recognise that the definitions of 'majority' and 'minority' are problematic. These are legislative terms in origin, as a sociologist, I do not see any justification in privileging a so-called majority position. I argue that the true test of democracy is the protection of the interests of the minority. Democracy ought to be the rule of the majority for the minority. For example, I argue that the ecology of society enjoys the status of a voiceless minority. Just because its position cannot be articulated by itself does not mean that the rights of the eco-system should be ignored. I do not want to get into the detailed implications of these arguments here. All I want to say is that the majority can be left alone, they will take care of themselves, the institution of state, as much as the constituents of the civil society (intellectuals are the foremost of these) must be specially sensitive to and caring for the needs of the minority. Let us take the extreme case of the physically handicapped in a society, they are not a big voting bloc, yet should the institutions of society forget them? All in all, your conscientious position on the 'minority' is laudable.

My family of orientation migrated from India to the erstwhile East Pakistan. Although I did not experience any discrimination personally from the 'majority' Hindu community in India, I learnt to appreciate the problems of minority and always felt a deep sense of gratitude for people who stand up for the minority, be it women in any society, African-Americans in America, Muslims in Bosnia, India or Israel, Hindus or other tribal groups in Bangladesh, Koreans in Japan or Jews in Russia. The list is almost never-ending. I assure you, you are not alone. There are many in Bangladesh who condemn religious bigotry and discrimination against minority and other oppressed groups. They may not be in the limelight of publicity but they are there. Ask my friend Swapan dada in Bagerhat: who helped his family after the brutal murder of his father in 1971? Ask Haridas who is now in Durgapur (West Bengal), who paid for his SSC examination fees? My mother did pay for his fees at a time when we had very little money to go by. We were poor but Haridas and his widowed mother were poorer. Siddique, a friend of mine from Bagerhat (Bangladesh), joined the peace committee (an ironic name for a group collaborating with the murderous Pakistani military authorities in East Pakistan in 1971) and hung around with the Razakars. Yet, I have a lot of respect for Siddique, for he did not turn down my request at a time when he could, if he wanted to. At my request, Siddique guided Tapan and Pradeep, two of my very good friends from my school days all the way to the Indian border safely. There are tens of thousands of such examples all over in Bangladesh. An author could highlight these examples of bravery and communal harmony and friendship in Bangladesh. However, you choose to project the seamy side of this inter-communal relationship. I think that is alright. As an author, you have every right to choose what you want to project and how. As a reader it is not my business to tell you what to write on. The fact that your authorial style is different and that you choose to write on subjects that very few authors dare to; you are at once admired, tolerated and hated by fellow Bangladeshis is something that reflects the ideological uncertainties that characterise Bangladesh today.

You are, indeed, in an unenviable situation. People have extreme views about you. In the internet (a computer network), I have read comments written in admiration of you by some who think that one day streets will be named after you, you are the Begum Rokeya of our time, etc, and there are the extremist critics who post obscenities and slay your personal life. When the dusts have settled and when we will look back, not in anger but with some sense of detachment, we will see that you have put Bangladesh in a positive light before the civilised world. And believe it or not that is the problem. If the western liberals are praising you, there must be something wrong. This is how many 'liberals' in our country feel. These are the same 'liberals' who sympathise with your atheist position but part company with you on your feminist views. I want to assure you that the controversies generated by your writings have provided us a window on the deep-seated cultural tensions that we find ourselves in Bangladesh today. We must ask: are we going to evolve into a truly pluralist, democratic society or are we heading for an authoritarian nightmare under the fashionable banner of post-modern conditions.

The main point of my letter is to debate with you on the role of religion. I have no quarrel with your social agenda. I find them laudable. I understand that in your *Statesman* interview you alluded to the revision of *sharia*, so I am not going to take issue with you on that subject. From your writings and various interviews I get a profile of your attitude towards religion as such and that is what I want to comment on. You are a well known and internationally famed author, yet I would treat you as if you were a colleague. A debate presupposes some degree of equality. I hope you will excuse my frankness, in that light. I think your understanding of religion is quite simplistic. I do not see any difference between your brand of atheism with its 18th century version. Materialist philosophers have always rejected religion. Remember, Maurice Halbwachs who said that the man who invented god must be the most intelligent man. Sexism aside, this is a view that came to dominate a good part of modern anthropology: God is created by society. One anthropologist put it: religion was not thought out, it was danced out. Another French philosopher asked: If God is good, why fear Him? Let us not get into a debate over the existence of god. Take the case of Marxism, a godless ideology. In the aftermath of the collapse of Soviet socialism, it is now clearer to me that the spiritual dimension cannot be taken so casually. Once the iron curtain was raised not only did we see economic deprivation but also a spiritual emptiness in many of the former Soviet bloc countries. I have come to the conclusion that the spiritual dimension should not be taken so lightly. I agree with your emphasis on humanism, but can it be a substitute for religion? It does not answer for us the 'ultimate' or 'telic' questions. Besides, humanism is not incompatible with religion. Think of Christian dictum: "Love thy neighbour as thyself". Many of the ideals enshrined in the values of liberalism and humanism are deeply entrenched in the Judaeo-Christian-Islamic traditions. Even Marxism can be seen as an outgrowth of this religious tradition.

I must agree with your identification of the negative functions of religion in society, a source of conflict, disharmony, bloodshed, etc. But this is only one side of religion. And there has been bloodshed over ethnicity, race and other such silly things. As society is becoming more and more bureaucratic, technocratic, and heartless, the dimension of meaning will become more and more important. Religion deals with the domain of meaning. You see, both Marx and Max Weber were concerned with the plight of the modern society—a spiritless time, a disenchanted iron-cage. By implication, they appreciated the need for the spirits and of enchantment. If today we abandon religion and spirituality, tomorrow we will relegate poetry, philosophy and love to the dustbin of history, for they are not compatible with the logic of material progress, technocratic society and rationality. If today we jettison the priests, who can say tomorrow it will not be poets?

Wildlife and Indigenous People

A K Jha

While the present condition of wildlife and their habitats impose heavy constraints on making provisions for ensuring the mutual sustainability of indigenous people, there is sufficient scope in the current legislation to re-establish the coexistence of people and natural resources.

THE issues concerning coexistence of wildlife and indigenous populations have always evoked diverse reactions. The considerations behind the need to have a sustained and mutually beneficial relationship between them have become more and more complex with time. With degradation advancing towards the interiors as a result of population explosion, the new focus is on finding ways to accommodate the indigenous people even within the sanctuaries and national parks that have remained in a relatively better position in terms of availability of natural resources.

The management of sanctuaries as well as national parks (protected areas (PA)) is done primarily under the statutory provisions of the Wildlife (Protection) Act 1972. In case, however, these PAs are formed of protected and/or reserved forests, the relevant provisions of Indian Forest Act 1972 apply to such areas too. The PAs constituted of 'forest land' (described as forest in government records) attract the provisions of the Forest (Conservation) Act 1980 also. Thus, depending on the legal status of land constituting the PA, one or more of the above-mentioned acts become applicable.

Considering that a number of statutory provisions pertaining to different acts may be simultaneously applicable on PAs in totality, one is tempted to conclude that the indigenous people of such areas are an over-controlled and over-legislated group of people and their basic rights are always under stress. Concerns are often expressed about exploitation of the people at the hands of regulatory bodies which, more often than not, have a strong bias in favour of forests and wildlife. One has to realise, however, that ensuring the sustainability of a finite resource against the onslaught of exploitative forces often operating from outside PAs is not an easy task and operating control mechanisms for indigenous people traditionally used to free goods and services from their vicinity is also an extremely unpopular job. Accordingly it is imperative that the acts influencing the management of these areas must be strong enough to avoid the possibility of their depletion under the influence of economic and political forces but it is equally true that these acts have to provide for the legal possibility of taking due care of the interests of the indigenous people on whose welfare the future of forests and wildlife ultimately depends.

An examination of the Wildlife (Protection) Act 1972 from this viewpoint reveals that the provisions for declaration of any area as a sanctuary (Section 18 to 26(a)) indicate specific procedure by which the collector enquires into indigenous people's rights and acquires or permits the continuance of the same in or over any land within the limits of the sanctuary. The acquisition proceedings specify the grant of compensation and/or alternatives too. Thus at the very outset redefinition of the relationship between people and wildlife as simultaneously existing mutually dependent entities in such areas becomes a legal possibility. Here the local people have to be convinced that a continued sustainable existence of resource-base is in the interest of those dependent on the same. It is here that understanding of the related issues as well as the ingenuity of the collector get a chance to be reflected in the settlement results.

Even after an area is declared as a sanctuary the chief wildlife warden, with the prior approval of the concerned state government, can permit the exploitation or removal of any wildlife (which includes vegetation also as per definition) in such area under Section 29. Here the chief wildlife warden, considering the potential role and input of the indigenous people in the improvement and better management of wildlife can definitely grant specific permissions to reinforce the mutual interdependence of people and wildlife so as to encourage sustainability. This possibility gets a support from government of India's recent stand regarding participatory management of forests. Such an approach is also in consonance with the National Forest Policy 1988 which specifically mentions that the requirements of the tribals will be the first charge on the forest produce.

So far as national parks are concerned there seems to be a definite desire on the part of the lawmakers to keep the same in the least disturbed situation and maintain them as sanctum sanctorums. No new 'rights' can be born in the existing national parks. Keeping an area of even less than 1 per cent of forest land in India in such a situation should not be seen as a tough stand as is quite often thought of. The Wildlife Act, however, still provides an opportunity to the chief wildlife warden to act in the interest of the indigenous people provided such an approach can be justified by defining it as being in favour of improvement and better management of wildlife in the existing national parks. The fact, however, remains that steps have to be taken with extreme care and caution and with long-term sustainability in mind.

Chapter III A in the 1991 amendment to the Wildlife (Protection) Act 1972 introduced with a view to protecting specified plants clearly indicates that members of scheduled tribes can freely pick, collect or possess such specified plants or part or derivatives thereof for bona fide personal use. This exemption is operative in regard to all forest land and even on other areas specified by government under Section 17A(a) but is subject to relevant restrictions in the PAs as imposed by the Collector/FSO during settlement proceedings. The hunting rights of the scheduled tribes of the Nicobar Islands in the union territory of Andaman and Nicobar Islands are exempted from the operation of relevant provisions of Wildlife (Protection) Act 1972. Similarly fishermen residing within 10 km of sanctuary or national park entering such an area on a boat not used for commercial fishing are exempted from seizure of their implements. The occupational interests of local fishermen staying near territorial waters are to be protected as per section 26-A/35 if such an area is to be declared as a sanctuary/national park.

It is, in fact, interesting to note that the 1991 amendment to the Wildlife (P) Act 1972 has introduced a new sub-section 24(2)(c) which empowers the collector to allow, in consultation with the chief wildlife warden, the continuation of any right of any person in or over any land within the limits of the sanctuary. Thus after 1991, continuance of individual's rights in the sanctuary becomes a legal possibility in clear contrast to the earlier situation in which claimed rights inside the sanctuary area could either be acquired or settled with due compensation but could not be allowed to continue in any case whatsoever. The same condition is applicable even for national parks. This is a major departure from the earlier stand and the spirit behind the act now is clearly tilted in favour of the local people.

A comprehensive look at the Wildlife (P) Act 1972 as applicable to the indigenous people reveals that it does contain specific possibilities for their welfare through coexistence with the natural resource around them. It is true that the present condition of wildlife and their habitats do impose heavy constraints when it comes to opting for generous alternatives in favour of the local people but it is equally true that the amended act provides scope for ensuring mutual sustainability of the indigenous people and wildlife while warding off the external pressures on this valuable resource. The role of officers as well as NGOs in this context becomes extremely important and crucial and accordingly, it is essential that people with appropriate objectivity and vision should shoulder this responsibility. Re-establishing coexistence is a challenge and defining new relationships in the present circumstances for ensuring sustainability is a greater challenge. Given the legal space provided by the Wildlife (P) Act 1972 the status of the two in coming times will ultimately indicate the level of will, wisdom and vision possessed by us.

Administering Land Reforms in Karnataka

S V Deshpande
Vijayakumar Torgal

An examination of the land distribution records and cases before the tribunal in Gulbarga district illustrates the fact that the implementation of land reforms suffers when the landed elite wield political power and there is no countervailing pressure from below.

LAND reforms in India is the most widely discussed, debated issue in terms of policy objectives, statutory formulations and implementation problems. However, many of the evaluative studies seem to concentrate on economic implications and consequences; the analysis with reference to other pertinent politico-administrative issues received peripheral attention. This concern is emphasised by Chinese scholar, Hung Chao Tai who opined "current research efforts on land reforms seem to concentrate predominantly on its economic implications and consequences. This over emphasis on economic analysis is often justified by the fact that economic development is one of the pressing issues of the developing countries reflects a relative intellectual neglect of the political aspects of land reforms."[1]

The studies on land reforms in Karnataka, do not emphasise adequately the socio-political and administrative dimensions. For instance, Narender Pani's evaluative framework presuppose more on the dynamics of legislation and implementation: how these exhibited built-in bias in favour of dominant socio-economic classes.[2] Another study mainly focused on studying economic behaviour of interested groups in the implementation process.[3] Recent studies deal with state processes *vis-a-vis* land reforms but fail to relate it to the micro-field evidences.[4]

Here we analyse land reforms in terms of evaluation of the administrative processes in the district of Karnataka. The tenancy and ceiling declaration case files as available in the taluk revenue offices formed the source material. These cases were filed before the land tribunal in the post 1974 phase. They are typical in the sense that try to capture distinguishing features of the nature of administrative processes.

Gulbarga district is selected for micro analysis. This district is characterised by lowest performance in the state both with reference to tenancy and ceiling cases. Table 1 points out the proportion of tenancy rejected applications. Some 82.20 per cent of tenancy applications were rejected by the tribunal. Thus only 18 per cent of tenancy applications were accepted by the tribunal. Table 2 shows the extent of ceiling declarations. The proportion of surplus land distributed to the total area covered under ceiling declarations amounts as little as 0.6 per cent (almost negligible).

Besides, the problem of implementation is also problem of litigation. Table 3 shows that more than 93 per cent of tenancy writ petitions were accepted by the high court. In case of ceiling this percentage amounts to 98.15 per cent. All writ petitions with regard to 'inam' (gift land) abolition were accepted by the high court. This clearly brings out the dismal performance in land reforms implementation in Gulbarga district.

Tenancy and Ceiling Declarations Cases

In one case,[5] the applicant claimed tenancy was disputed by the landowner. The landowner claimed that applicant was a hired labourer and not a tenant. In support, the landowner presented a letter said to have been written by the applicant's father to him. The applicant denied that his father had ever written such a letter to the landowner. The applicant said that neither he nor his father cultivated the land on a hired basis. The tribunal conducted a spot-enquiry. It examined witnesses of cultivators of the adjacent land and from other fellow cultivators and found that the tenant's claim was true. The case was decided in favour of the applicant. The landowner went to the high court with a writ petition claiming that the supposed tenant's name was not recorded in the record of rights. This is surprising given the fact that earlier tribunal conducted spot-enquiry which revealed the true tenant's status on the land. This indicates the possibility that the landowner might have tampered with the record of rights with help of the village accountant. The high court admitted the landowner petition and ordered the tribunal to conduct a fresh enquiry. The passing of fresh orders took almost two and half years which ultimately decided the tenant's claim was true.

In another case[6] the landlord used litigation as a means to delay the disposal of a case. The applicants were three harijans. They filed tenancy applications to the land tribunal saying, "The village patawari by means of corrupt practices had made wrong entries in the name of 'X'. The said 'X' had never been in possession of the portion of land held by the applicants." The tribunal conducted the spot-enquiry which revealed the true assertion of applicants. Thus the decision was made in favour of the applicants. Against this, the landowner filed a writ petition. The high court quashed the tribunal order and sought a fresh enquiry. Again the decision was made in favour of the tenant. The landowner filed a writ petition for the second time. The case could not be disposed by the high court and was transferred to the district land reforms

Table 2: Surplus Land Distribution in Gulbarga District

	Number	Extent (In Acres)
1 Number of declarations received	18608	1168299
2 Extent, determined as surplus	1734	46240
3 Extent taken into government	–	26570
4 Extent distributed among:		
i) Scheduled castes	2287	10406
ii) Scheduled tribes	286	1459
iii) To government departments	7	215
iv) Others	1568	6839
	4148	18919

Table 1: Proportion of Successful Tenancy Applications in the District

appellate authority where it was pending since 1979. In a third case a tenant contradicted his own statement perhaps on the basis of mutual compromise. The tenant applicant claimed that he was a tenant on a plot of land with an extent of 13 acres, and the tribunal passed an order upholding his claims. In the meanwhile, the owner's brothers went to the high court against the tribunal order where a fresh enquiry, was ordered. Surprisingly, in the fresh enquiry, the tenant made a contradictory statement saying that the land was given to him for cultivation in view of a mortgage contract. The owners had paid the money and he had now returned the lands back to the owner. The tribunal in its fresh enquiry rejected the earlier tribunal order.

A ceiling declaration case illustrates the attempt to subvert ceiling provisions by a fictitious claim that the family of the declarant was partitioned.[7] The enquiry as to the actual land held by the declarant was conducted by the revenue inspector with the help of village accountant. The enquiry estimated total holding 82 acres 35 guntas (40 guntas = 1 acre). The tribunal on the basis of this report, declared the surplus land as amounting to 18 A 03 G. The declarant filed a writ petition in the high court claiming that the land held was under joint family and it was partitioned among the brothers in 1968. The tribunal in its fresh hearing upheld the declarant claim.

In another case inordinate delay in disposal led to disappearance of the surplus land.[8] The declaration indicated the extent of land held was 86 A 35 guntas. The extent of surplus land estimated was 16-34. As per the final notice in March 1982 the additional special tahsildar declared that the declarant should surrender 11 acres 20 guntas. As against this order, the declarant filed a writ petition in the high court. The writ petition claimed that the client's son was a minor at the time of filing the declaration, has now become a major while passing the order in the year 1981. The order of the special tahsildar was stayed. Finally, the special tahsildar in his order in March 1986 declared that there was no surplus land to be surrendered.

In a third case[9] an attempt was made to subvert ceiling provision by a fictitious claim that part of the land held was tenanted.

The revenue inspector conducted local enquiry with the help of village accountant and ascertained that the total holding of the declarant was 71 acres 25 guntas. One of the survey numbers covering an area of 15.01 acres was under tenancy dispute. The supposed tenant filed tenancy application on the said land. The tribunal rejected the tenancy application. The said tenant filed the writ petition. The high court remanded the case for fresh enquiry. In the tribunal enquiry, the landowner surprisingly accepted the tenant claim that he was a tenant on the said land. Thus from the total area of 71.5 acres an area of 15.01 acres now covered under tenancy was deducted. Thus only 2.2 acres were declared as surplus. It was revealed to us that the landowner had come to an understanding with the said tenant in order to evade a surplus of 15.01 acres from the purview of the ceiling limit.

The overall account of tenancy and ceiling declaration case files indicate that attempts were made to frustrate the tenancy provisions by tampering the record of rights, using other tactics such as litigation and reaching secret compromises with the party concerned. In the case of ceiling legislation, landowners tried to subvert the law through effecting partitions, litigation and employing other manipulations such as claiming land under tenancy dispute.

Some Implications

Usually, the term administration is conceptually identified with the term implementation. This may lead to the fallacy of equating implementation failure solely with the administrative ineffectiveness. This kind of conceptual identification is reflected in most of official evaluations of land reforms. For instance, the Sixth Five-Year Plan (1984-85) states: "If the progress of land reforms has been less than satisfactory, it has not been due to flaws in policy but to indifferent implementation. Often the necessary determination is lacking to effectively undertake action particularly in matter of implementation of ceiling laws, consolidation of holding and in not vigorously pursuing concealed tenancies..."

This may be disputed. In some of the tenancy and ceiling declaration cases, we have seen landowners opting for litigation, compromises, partitions, transfers, etc. These are environmental and structural compulsions; the underlying reasons for failure are thus multi-casual or multi-dimensional. What is thus necessary is to take account of a host of other interrelated factors bearing on implementation supplemented with the evaluation of administrative functioning.

Secondly, the issue relates to the nature of state itself. Gunar Myrdal characterise Indian political regime as 'soft state'. What is meant here is that Indian state is more susceptible to societal constraints. In the case of land reforms, this implies that the state has little autonomy independent of landed interests. The influence of landed gentry is so formidable that the state has to succumb to the former. This is especially so in a district like Gulbarga in Karnataka, where the landed gentry is socio-politically very powerful.

It is very difficult for the administration to function as a neutral or impartial instrument in the implementation of policy. Thus a technocratic view point of administration (as an organisational and managerial concept) and Weberian 'rational-legal bureaucracy' is ineffective. In fact the nature of political process operating at various levels (micro and macro) does not allow administration to function as an objective instrument.

Ultimately, the issue boils down to two main interrelated aspects: political capacity of the landed elite and countering pressure from below. The implementation process is bound to suffer if the political capacity of the landed elite is great and there is no countervailing pressure from below. The district like Gulbarga characterised by backwardness, low literacy and depressing income status represents such a situation.

The following aspects needs to be taken into account in the overall evaluation of land reforms. In the first instance, land reforms administration should have in-built boundary control. This is with a view to minimising the environmental interference in the day-to-day administration. The overall rural environment has an inherent tendency to interfere in the administration of development programmes. To this end attempt should be to constitute peoples committees (representatives of cross-cultural

Table 3: Writ Petitions Filed, Quashed and Upheld

rural population) as check and balance mechanism.

Secondly, the large chunk of concealed tenancies should be detected. Besides, the order to know the exact extent of holding owned by the landowner, the record of rights should be streamlined. In addition, sound personnel recruitment procedures, proper integration of services, strict supervision and control system and easy information network available to the clientele must become part of administrative reforms. Finally, bureaucratic rigidity is dysfunctional. Dynamism and not total inflexibility is the solution. However care should be taken that dynamism does not hamper the organisational objectives of the administration. Thus the imperative is to look into some corrective mechanisms in the arena of politico-administrative functioning.

Muslims and Mass Media

Yoginder Sikand

Only a radical altering of the ownership structure of the Indian media in favour of marginalised and silenced social groups can firmly counter its communal, class and caste prejudices.

THE newly-formed Indian Association of Muslim Social Scientists held its first meeting at Bangalore on June 11 and 12. The topic on which over 200 leading Muslim scholars, lawyers, journalists and other professionals had assembled from various parts of India to deliberate was 'The Role of Muslim Social Scientists in Contemporary India'. During the course of the two-day conference several problems affecting the Indian Muslims were discussed threadbare and suggestions were put forward for constructive action that urgently needs to be taken in order to tackle them.

The participants at the seminar were divided into several groups based on the area of their specialisation. Perhaps the most fruitful discussions were held in the group composed of several notable Muslim mediapersons who dealt with matters related to Muslims and the mass media. The general tendency of the media to portray Muslims in a poor light, the severe lacunae of the Muslim-owned press and the ameliorative steps that must be taken in this regard all came in for intensive discussion. It was the general view of the discussants in the mass media panel that there exists a fairly widespread bias, both unwitting as well as deliberate, in a significant section of the mass media, not just in India but in the west as well. Abdur Rahim, head of the department of journalism at Hyderabad's Osmania University, asserted that Muslims may even be said to be the most closely scrutinised community in the press. Maqbool Ahmad Siraj, editor of 'Features and News Alliance', a Delhi-based news agency, added that besides the naked physical assaults on the Muslims they are also made victims of subtle and insidious intellectual assaults in the form of negative portrayal of their religion and themselves as a community in the media. By seeking to embroil Muslims in controversies over relatively minor issues, the communal press has, he contended, to a great extent prevented the crucial social problems of the community from getting the attention they so desperately need. Since there are very few Muslim media workers and among those that exist, even fewer with organic ties with their own community, countering anti-Muslim propaganda is really an uphill task. Moreover, he noted, as little sociological investigation has been undertaken to ascertain the actual social conditions of the Indian Muslims, misplaced stereotypes and baseless myths about them freely propagated in large sections of the press are difficult, almost impossible, to counter effectively. Most Muslim-owned papers, Siraj opined, have only further compounded this problem by concerning themselves either with purely religious issues or with matters of peripheral concern to the community, in the process neglecting pressing social problems.

Another issue which came in for discussion at the seminar was the severe shortcomings of the Muslim-owned media—largely the Urdu press. Most Urdu papers, it was revealed by a participant, have a very low circulation, especially in the erstwhile bastions of this language—Uttar Pradesh and Bihar. The bulk of the educated Muslims in these two states have switched over to Hindi instead. As a result, several Urdu papers have now had to launch parallel Hindi editions. This has further added to the problem of the languishing of the Urdu press. Financially, most of these papers are extremely insecure and cannot even pay for news and features services. Many of them, according to Siraj, directly lift off news from the slow-speed news bulletins on the radio and simply translate articles from the Hindi and English press. They thus come out with stories much after Hindi and English papers do. Consequently, Muslim readers increasingly prefer to read Hindi or English papers instead for they can thereby get access to the news on time.

According to S Ilyas, editor of the popular Urdu weekly, *Afkar-e-Milli*, the stiff financial constraints most Urdu papers face also mean that they cannot afford to pay their writers, which, in turn, translates into the poor quality articles that they have to publish. Neither can they afford to employ well-trained staff. It is also not possible for them, for the same reason, to send their writers to the field for detailed on-the-spot investigative reporting. "Pure desk-work and no leg-work", as Ilyas put it, characterises most Urdu papers. Another participant in the discussions, Ahmad Hasan Khan, editor of the Bengali weekly *Kalam*, noted that since Muslim-owned papers, especially the Urdu ones, have a very low circulation, businessmen do not find advertising in them a profitable venture. Hence, these papers are starved of the resources that they could have earned through advertisements. Even in cases where businessmen do advertise in Muslim-owned papers, this does not translate into improved quality of the papers. Khan revealed that in Tamil Nadu over a hundred Muslim-owned periodicals are being published and local businessmen do advertise in them. However, due to the large number of these publications (though most have a very low circulation), this investment in advertising is spread out very thinly, as a result of which no single paper gets funds enough to allow it to attempt to improve its standards substantially.

Participants in the discussions also put forward concrete proposals for countering anti-Muslim prejudices in the media and for enabling the real social problems of the community to receive adequate attention. It was felt that this deserves the top priority of community leaders given the fact that in the words of V T Rajshekar, editor of the Bangalore-based fortnightly *Dalit Voice*, who also participated in the discussions, in

this age of the information revolution, the mass media is now fast assuming the role of the First Estate. A general consensus seemed to prevail at the seminar that the press in India on the whole represents the interests of the urban 'upper' caste elite for it is owned and manned largely by them. Consequently, it is not just the Muslims but, in fact, all marginalised groups such as women, dalits, tribals, backward castes, peasants and workers, that the mass-media is biased against. In the final analysis, it was said, only a radical altering of the ownership structure of the Indian media in favour of marginalised and silenced social groups can firmly counter its communal, class and caste prejudices. One speaker made the startling revelation that of the 300 or so English dailies in India only one is Muslim-owned—Bombay's *Mid-Day*—though even this paper does not really represent the Muslim viewpoint. Not surprisingly, therefore, Muslim views and aspirations receive but scant coverage in the general press.

Besides altering of the ownership structure of the press, countering communal prejudices in the media, it was agreed, must be made part of a wider struggle of all marginalised groups to have their voices heard and their demands articulated in the media. The Muslim-owned press, it was said, must take up issues concerning other downtrodden sections as well. Similarly, the growing trend of the backward caste and dalit press highlighting Muslim problems must be further encouraged, the participants stressed.

The need for encouraging young Muslims to take up media-related careers was given particular emphasis by Ilyas, given the pathetic state of media consciousness among the Muslims in general. Community leaders, it was suggested, could be mobilised to encourage young Muslims in this regard. A Bangalore-based journalist Javed Khan, cited the instance of an imam of a mosque in Mysore who regularly raises this issue in his Friday sermons. He also revealed that a local Muslim social work organisation, the Fiqh Academy, had been regularly organising lectures for maulvis on the importance of the mass media. One participant observed that there are conservative sections in the Muslim community, especially among the ulema, who actually believe that the electronic media is a Satanic device. Hence, educating them about the vital importance of the media, including the electronic media, is an urgent task. Provision for scholarships for Muslims enrolled in journalism courses was also suggested as was the institution of awards for journalists highlighting Muslim social problems.

Since Urdu is fast dying out, Muslim journalists, the participants stressed, must now start writing in Hindi and other regional languages as well, since most people, irrespective of community, read papers in these languages. Ilyas noted that of late a number of Muslim-owned regional-language papers have been launched but they confine themselves, by and large, to religious matters, neglecting the vital social problems of the Muslims and other marginalised communities. In this regard the success-story of the Muslim-owned Malayalam daily, *Madhyamam*, with its circulation of over a lakh, was cited and its laudable efforts in articulating Muslim views and countering misinformation was highlighted. The discussants maintained that anti-Muslim biases in the press cannot be countered simply by starting a new paper, for most Muslim-owned papers have few non-Muslim readers. Moreover, as one participant noted, there is a general tendency for a Muslim-owned paper to be branded by others as specifically 'Muslim', and, thus, not to be read. Hence, Muslims must be encouraged to also write for papers run by others, in particular by other marginalised communities such as dalits and backward castes.

To improve the existing Muslim-owned papers the participants stressed the need for professional training and refresher courses for their staff. The sensationalism of sections of the Urdu tabloid press came in for sharp attack. It was felt that the tendency of some of these papers to mix facts with myths and wild rhetoric can only prove to be counter-productive as it weakens their own credibility as well as being harmful for the community as a whole. To counter their sensationalism, to make Muslim-owned papers more accountable to the community and to bring serious Muslim social issues to the fore, the need for Muslim social scientists and social activists to write in popular vernacular periodicals was stressed as was the necessity of encouraging Muslim businessmen to advertise in socially responsible Muslim papers. Ilyas felt that in south India Muslims could play a leading role in this regard since they are economically better-off than their northern counterparts and their relations with other communities fairly cordial, unlike in the north.

Among the other suggestions put forward by the participants was the setting up of news agencies that could disseminate appropriate information as well as operate as documentation centres and as media-monitoring institutions. One particularly important task that they could take up was the maintenance of a profile of India's top 60-odd journalists who shape public discourse and help set the agenda for Indian politics. Further, besides the press, other forms of communication, such as the oral and electronic media, it was agreed, need to be tapped to highlight Muslim problems. Finally, besides stressing the need to improve the content of the press, the problem of the proper distribution of suitable information was also highlighted. The need for this information to reach ordinary Muslims in the villages and the 'qasbas' at affordable prices was recognised as an issue that needs the attention it so obviously deserves.

Statement of the Chairman, Mr. Nani A. Palkhivala

58th Annual General Meeting

at the Birla Matushri Sabhagar, 19, Sir Vithaldas Thackersey Marg, Bombay – 400 020, on Wednesday, August 24, 1994, at 3.45. p.m.

We are living in an age of transition and transformation. The first half of the twentieth century witnessed the collapse of colonial hegemony; the second half, the downfall of communism.

Events are happening which none had foreseen. If hubris were not such a pronounced human trait, we would have lost all faith in our so-called "experts" by now.

In 1972 the Club of Rome published a frightening prediction of the years in which certain key raw materials would run out: gold in 1981, silver and mercury in 1985; tin in 1987; petroleum in 1992 and natural gas in 1994; lead and copper in 1993. The world population explosion has been no lower than was anticipated in 1972; but the natural resources are still plentiful and show no signs of petering out in this century.

In his book "The Death of Economics", Paul Ormerod says, "Economics is really like science before Newton. A few things will stand the test of time, but the rest is meaningless." He suggests that his colleagues pay more attention to cultural and historical factors and less to mathematical models.

India continues to be the Rudderless Democracy, governed by self-deluded, self-interested, self-important politicians. Thanks to Dr. Manmohan Singh, we have advanced economically. But not socially or politically. We continue to have the uncanny ability to slip on every available banana skin. The mandir-masjid miasma and the threat of disintegration still stalk the land. We have graftocracy instead of bureaucracy.

General Omar Bradley's words will bear repetition: "Ours is a world of nuclear giants and ethical infants. We know more about war than we know about peace, more about killing than we know about living. We have grasped the mystery of the atom and rejected the Sermon on the Mount."

The only hopeful sign is that the unawakened conscience of the citizens of "the soft State" is beginning to be aroused from the slumber of years. People are now conscious of the degradation to which they have been reduced. They are awakening to the eternal rule that it is the behaviour which society chooses not to punish that tells you about the prevailing ethical standards.

The cement industry

The cement industry, which depends heavily on all-round economic growth, has had little or no assistance from the Finance Minister's "otherwise welcome" Budget this year. Instead of the expected relief in the high excise duties, the industry has had to contend with additional excise duty on clinker.

The industry's capacity, as on March 31, 1994, was 69.28 million tonnes. This meant an additional capacity of 4.34 million tonnes in 1993-94. The industry achieved a production of 54.1 million tonnes – registering a seven per cent growth over the previous year. Capacity utilization was 85.5 per cent.

ACC's performance

Your Company's performance has been quite encouraging. Capacity utilization was 97 per cent, with cement production totalling 7.72 million tonnes, and despatches registering 7.75 million tonnes. Clinker production was 5.98 million tonnes. Increase in despatches, inclusive of trading activity, was 7.3 per cent.

Cement exports also showed a marked increase over the previous year at 1.3 million tonnes, and clinker at 1.5 million tonnes - compared to 0.82 million tonnes and 0.36 million tonnes, respectively in 1992-93. Your Company's exports for the year under review totalled 1.89 lakh tonnes (as against 1.38 lakh tonnes last year). This resulted in ACC bagging the CAPEXIL Top Export Award for 1992-93.

Despite recessionary trends, your Company has been making significant capital investments, particularly in its core sector business, cement. Production capacity is poised for an increase of over two million tonnes per annum, with the commissioning of the new production units at Gagal and Kymore. These new units possess the latest in equipment and technology, including higher energy-efficiency and pollution control measures.

Your Company has made strenuous efforts to restrict expenditure through several cost-saving devices. While coal prices were hiked twice in 1993 resulting in a 17 per cent escalation, and railway freight went up by 12 per cent, your Company restricted coal cost increases to less than three per cent, by rationalizing sources of coal supply. Further, the coal inventory was reduced by one lakh tonnes, without entailing any loss in production. Substantial reductions of over Rs. 60 crore were also achieved by reduction in inventory of coal, stores and spares, packing materials, slag, gypsum, etc.

Your Company's refractory business continued its impressive growth during the year, when most other producers were forced to cut down production due to the

severe recession in the primary refractory consuming industry, steel. Turnover increased to Rs. 70.36 crore, which was 15.3 per cent higher than the previous year. The Katni refractory plant is operating at near 100 per cent capacity and your Company has, therefore, decided to set up another unit at Sindri in Bihar to meet the growing demand for our refractory products.

Your Company will soon commence production of Perilex-ACC bricks for cement plants in India. Hitherto, Perilex bricks were being imported from Refratechnik, Germany. ACC is the first licensee of Refratechnik for these bricks anywhere in the world.

Production of brown tabular alumina (BTA) was started at the Kymore refractory plant. The refractory projects and application services group made new strides during the year and has already earned a position of leadership in this field by carrying out a number of important assignments.

Your Company's engineering subsidiary, Associated Tyre Machinery Company (ATMC), has posted a 19 per cent increase in sales over the previous year despite the recession in the tyre industry.

New businesses

Your Company has undertaken a joint venture project – Alcoa-ACC Industrial Chemicals Ltd. – with the Aluminum Company of America (Alcoa), the world's largest producer of alumina and alumina-based chemicals, for the production and sales of raw materials for the refractory and ceramics industries. The project at Falta in West Bengal will go on stream shortly. This is the first project to produce such sophisticated raw materials in India and it is also the first venture of Alcoa in India. The association with Alcoa envisages marketing, through Alcoa, of raw materials produced by ACC for refractory industries, in Europe and in other parts of the world.

Your Company's subsidiary, Webel Electro Ceramics Ltd (WECL), has signed a technical collaboration agreement with Siemens Matsushita Ltd (S+M), Germany. S+M is one of the largest soft ferrite manufacturers in the world. It is proposed to expand the plant capacity from 465 tpa to 2,250 tpa, with over 70 per cent of production committed to exports. It has also been agreed that S+M will market WECL products internationally, while Siemens India Ltd. will handle the domestic marketing.

Another diversified activity of your Company, viz the 10,000 tpa capacity synthetic ferric oxide (SFO) plant at Falta in West Bengal has also progressed satisfactorily. This Rs. 40-crore project, which incorporates know-how from International Steel Services Inc., USA, and IROX-NKK, Japan, is expected to go on stream by September this year.

The ultimate resource

Your Company continued to focus its attention on the most important of its key assets, the people who make up the ACC family. With the changing business scenario, the human factor has assumed even greater significance. In today's highly competitive if not aggressive environment, your Company has embarked on a planned and continuing strategy encompassing all facets of human resource management. This includes training and upgrading of skills at all levels of personnel. It will, doubtless, help us in maintaining the loyalty and dedication of the ultimate resource, the people, who make this Company what it is.

Period of adjustment

This period of transition is crucial to the future, not just of your Company but also of the cement business as a whole. It is the time of opportunity both for individuals and for organizations.

I believe the future will be as exciting and as threatening as the past, and that the unprecedented acts of individual leadership which have characterized our present era, will continue to change our lives. Learning to adapt and to assimilate during this period of adjustment is not going to be easy.

I am confident that under the stewardship of Dr. Subrata Ganguly and his team, backed by a loyal and dedicated workforce, your Company will succeed in creating an enabling environment for change. On your behalf, and on behalf of the management, I take this opportunity to express my appreciation and gratitude to each member of the ACC family for his contribution and dedication to keeping your Company in its pre-eminent position in the industry.

Bombay, July 25, 1994

THE ASSOCIATED CEMENT COMPANIES LTD.

ACC THE ASSOCIATED CEMENT COMPANIES LIMITED

times change,
our values don't

Vote Power and Lobby Power

S R Sen

It has become absolutely necessary to take a number of measures, including a change in the electoral system, to curb money and muscle power in elections and, equally important, the role of lobby power in influencing government decisions.

IN medieval Europe, Catholic theologians claimed that the voice of the church was the voice of god. After the renaissance and reformation and the emergence of nation states, some kings claimed primacy over the church, the theory of divine right of kingship was put forward and they claimed that the voice of the king was the voice of god. As a reaction, specially during the 18th century, the thesis was advanced that the voice of the people was the voice of god.

The possibility that the voice of the people may be the voice of the demagogue was not paid due attention. Aristotle's thesis that democracy was not a good form of government but only the least bad of three *bad* forms of government, tyranny, oligarchy and democracy, all led by self-serving people, was not heeded.

In direct democracy, the voice of the demagogue often came to be treated as the voice of the people. Since direct democracy was not practicable in a large state, representative democracy was recommended as the basis for government in a nation state. It was said that the risk of dominance of a demagogue would be less in representative democracy than in direct democracy. But Mussolini and Hitler demonstrated that representative democracy was no proof against demagoguery.

MONEY POWER

But modern democracy has come to be dominated not by the voice power of the demagogue alone but also by the money power of rich people commanding both voice power and muscle power, as has unfortunately been the experience in a number of countries including those of the Indian subcontinent. How the money power of rich people, the voice power of the media and PR people often as proxy for the demagogues and the muscle power of party cadres together influence the voting pattern of the people and the results of elections needs no elaboration. The voice of the representatives elected by the people to the legislature and government therefore rarely represents the true voice of the people.

Even then the system of direct election of legislators by adult suffrage is superior to any form of indirect election as it would be too costly for any individual to control it entirely. In indirect election there is much greater scope for buying and selling of votes and putting physical pressure on the small number of members of the electoral college than in direct election, as has been found in a number of countries. The corruption that resulted from the system of indirect election that was introduced by president Ayub Khan in Pakistan is a recent example.

If the three good forms of government listed by Aristotle, i e, benevolent monarchy, aristocracy and polity, are found to be unrealistic or liable to be quickly replaced by Aristotle's three bad forms of government, i e, self-serving tyranny, oligarchy and democracy, due to the frailty of human character, then it is certainly better to have democracy than the other two. At the same time it is also important to recognise clearly the deficiencies of representative democracy, especially the dangers that the combination of money power, voice power and muscle power tends to pose.

ELECTORAL SYSTEM

Of the alternative forms of direct election in representative democracy, namely, proportional representation, separate electorate, simple joint electorate and interdependent joint electorate, it is the last noted system which is subject to less perversion than the other three.

Election by a system of proportional representation may sound attractive prima facie but the experience has also shown that in proportional representation, communalism (e g, religion, casteism, tribalism, racialism, etc) tend to get more pronounced. Election campaigns based on religion, caste or tribal loyalty and/or hatred frequently become an important determining factor. From this standpoint, separate electorate is much worse. This deficiency also occurs in simple joint electorate, especially if a single community (e g, religious group or caste or tribe) has over 50 per cent majority in a constituency.

On the other hand, in the system of interdependent joint electorate, religion, caste or tribal loyalty/hatred based politicking would be much less, candidates would have necessarily to care for the votes of religious groups, castes or tribes, etc, other than their own and would be obliged to follow politics of mutual accommodation and compromise than the politics of extreme confrontation that is the bane of the present electoral system in India. The scope for forming vote banks and using such banks to get elected would be also much less in a system of interdependent joint electorate.

As has been explained in an earlier article on 'India's Political System' (*EPW*, January 2-9, 1993), it should not be difficult to operate this novel system of interdependent joint electorate on the basis of the census or administrative information about religious groups, castes, tribes, etc, in different districts. All that would be needed is to divide roughly the total electorate in every constituency into two categories in which the most populous community (religious group, or caste or tribe, etc) would be placed in the first category and all the others in the second category. Therefore ballot papers in different colours, say, white and blue, would be given to these two categories of voters and the electoral law should prescribe that in order to get elected, a candidate must secure both (i) maximum percentage of total votes polled, and (ii) 8 per cent or more of the votes polled in terms of each colour of ballot papers, white and blue.

This system would be simpler than the 'list' system of Switzerland and more practicable in a big heterogeneous country like India with a large illiterate population. This would also help curb the dangers of religious affinity, casteism or tribalism based campaigning in contrast with our present system of simple general electorate. It would help curb attempts at demogoguery, vote rigging, etc. Further, it should help encourage moderation and discourage extreme confrontation among political parties.

The need for introduction of such an interdependent joint electorate system has become very urgent with the recent introduction of Panchayati Raj in the country. Panchayati Raj has many merits. But there is a danger that with the introduction of the traditional electoral system, it may aggravate extreme confrontation, muscle power, money power based politics in the rural areas also. It is, therefore, important that the interdependent joint electorate system as proposed above is introduced first in elections to Panchayati Raj bodies. With the experience thus gained this system may be subsequently introduced for elections to the Lok Sabha and the Vidhan Sabhas.

CURBING MONEY AND MUSCLE POWER

But it is necessary to emphasise that this reform by itself would not be enough. It would be desirable to take a number of other measures to curb money power and muscle power in elections for the Lok Sabha and the Vidhan Sabhas as suggested in the above noted article:

(i) A clear distinction should be made between 'national' and other recognised political parties and the former (which have polled a minimum percentage of votes and got elected to the Lok Sabha a minimum number of candidates in each of at least three separate zones in the preceding general election) should be provided concessions, facilities and assistance in kind and/or cash much higher than the other recognised parties. This is essential to promote national parties and to prevent them from being unduly dependent on a few financiers.

(ii) The sharp increase in the number of 'non-serious' candidates has become a menace. Mere prescription of a higher security deposit will not be enough. All non-party candidates should be required to have at least 10 proposers, including a former or sitting MP or MLA.

(iii) Competitive use of money and muscle power and escalating costs have also become a serious menace. To curb this, it will be desirable to supplement the present financial limits for election related expenses by physical limits also, e g, low cost specifications regarding number, size, material and colour of handbills, posters, hoardings and wall paintings, newspapers, radio and TV advertisements, number of vehicles and election campaigners used (to keep down money power) and also to ban large electioneering meetings needing use of more than one microphone, all election related processions and use of unregistered and unapproved election campaigners. All campaigners should be checked by an agency appointed by the Election Commission for their suitability and issued identity badges to keep out known 'goonda' elements (to keep down muscle power). Since all the information that the voters really need is qualification, experience, party affiliation and objectives of the candidates, no costly, hi-tech and highly competitive publicity campaign is necessary.

(iv) The election of office-bearers at an open general meeting of a registered party must be held at least once every two years in the presence of an 'observer' nominated by the Election Commission.

(v) The accounts of the party must be audited by an auditor selected out of a panel approved by the Election Commission.

(vi) The party should not receive any donation or other payment above Rs 500 except by an A/c payee cheque.

(vii) Very stiff penalties should be imposed for malpractices notified by the Election Commission.

(viii) Every political party (as well as a candidate) seeking an election symbol must sign a pledge in writing that it (and he or she) accepts unreservedly the unity and integrity of India and abjures propaganda against any religious group or caste or tribe or language and other fissiparous or chauvinistic action that can adversely affect national unity and integrity.

It may be noted that most of these measures can be taken under the present powers of the Election Commission or parliament and do not require any amendment of the Constitution.

LOBBY POWER

What is even more important is to recognise clearly the undesirable role played by lobby power in our present political system.

Experience shows that what happens during the period between two elections is often important than what happens at the time of the elections. The elections are usually fought on the basis of no more than two or three general issues, and many other important issues are virtually ignored. The promises made during the election do not cover these other issues and give a lot of discretion to the elected representatives. Even the main issues highlighted during an election are soon forgotten. The electorate has no power between the elections to control their elected representatives.

During the period between two elections, therefore, lobby power of a few influential persons with members of the government becomes much more important than the voting power of the mass of the people at the time of the election. This lobby power usually takes the form of money power of rich people, businessmen or landlords who may use it in various ways to influence both the elected members of the government and the appointed senior bureaucrats. In practice this lobby power is much more effective than usually recognised by the votaries of our present system of election and government, especially as money power can help buy voice power and muscle power also.

There are various insidious and cunning ways of using money power to get results. A politician or official who would not take money personally would often accept without much trouble for his conscience, donation to designated organisations, offers of jobs and scholarships for his relations, transport and guest house facilities, presents in kind for himself and purchase of art or other objects made by some member of his family. Once he accepts any of these offers, he comes under the influence of the moneyed men offering such gratification and cannot easily say 'no' to their subsequent requests.

Experience shows that in reality it does not cost very much to make effective use of money power so far as the average politician or official is concerned. A former officer of the American CIA has gone on record to say that while he was given a certain amount of dollars to topple a former prime minister of Iran, Mossadegh, it did not cost him more than a third of that to do so. He was himself surprised at the very low price that he had to pay for crucial services of politicians and officials in a developing country like Iran.

After the Bangladesh war, prime minister Indira Gandhi was opposed to India taking any financial grant from the US government. But the US government pressed very hard that India should take at least a token aid which she reluctantly agreed to. A main reason that some US officials gave in private talk was that they wanted to ensure some sort of continued relations between the officials of US and India. Even now direct aid from US government to India is relatively small, but this gives valuable access to US officials to contact their Indian counterparts and establish useful personal relations.

If this is important for governments, it is even more important for businessmen. Therefore they usually offer donations to all important political parties so as to establish and maintain valuable personal contacts. Then they follow it up with much larger amounts of payment, indirect if not direct, when a politician or an official gets into an important decision-making position. As mentioned earlier, this need not take the form of direct payment of money but various other insidious forms in times between two elections.

Some studies have shown that money donated in election times may influence the election of more pliable legislators. But that does not ensure that these legislators will necessarily subserve the interests of the donors later. Further, unlike the key politicians, the key officials are not dependent on elections but are often in a position to promote or delay certain key decisions. It is, therefore, not so much the money and effort spent for campaigning during election but the money and effort spent for lobbying in between elections which is more important.

In earlier days, leaders like Pandit Nehru were not dependent on donation from rich people for their political power. Also, good pay, pride of job, moral pressure from 'peers' helped keep the officers of the old senior services relatively unaffected by money power exercised by businessmen. Undoubtedly there were some blacksheep but they were easily identified by their colleagues and kept under vigilance due to the relatively small numbers.

But now many of the leaders in important political parties are easily accessible to businessmen on whose donations they depend for financing their costly elections and also maintaining the party. Very few of them are in a position to say 'no' to the requests made by their donor. And as the old proverb says: "If the king steals a cup of milk his officers steal a whole tank full". The falling value of the rupee has eroded the real value of the salary of most of the key officials and the growing consumerism has increased the demand on them from the members of their families. Only a small proportion of the officials may take bribe directly but most of them do not mind accepting some gratification or help in other ways. Especially the feeling that a large proportion of their colleagues are accepting unethical, if not illegal, gratification, the feeling of shame for such misconduct that obtained not only before world war II but even in the 50s, has now practically disappeared. A's father or husband can get so many goodies for his family, why should not B do it? So runs the theme.

Lobby power backed by indirect, if not direct, corruption has thus become now the order of the day. The harsh fact therefore is that the lobby power of the rich people is today much more effective and pervasive than the voting power of the common man.

How this insidious cancer can be corrected is not an easy question to answer. Before world war II nearly 98 per cent of the senior officers used to be honest and upright. During world war II and the inflation of the 40s and 50s, the proportion had decreased substantially so that corrupt officers were no longer an exception to be looked down upon by their colleagues. Today in the 90s, an officer who is not corrupt is considered an odd ball.

The fact that with rising cost of election, the politicians have now become the prime source of corruption has added fuel to the fire. If any corrective action has to be taken then it should first aim at reforming the electoral system on the lines mentioned earlier. The power of 'recall' as advocated by Jaiprakash Narain could also help.

Transparency in Government

The government must also be made much more transparent. Investigative journalism into the conduct of politicians and officials alike should be encouraged (subject of course to the safeguard of a good defamation law and financial assistance to the defamed minister or officer to get a law court to punish an untruthful defamer). The Official Secrets Act should be suitably amended. Above all, the growing consumerism should be curbed and younger people should be taught to despise all ostentation and oppose all lobbying. Above all, the present system of detailed controls need to be greatly simplified, if not scrapped, and kept under regular parliamentary review. Pandit Nehru's concept of limiting control over only the commanding heights was not basically wrong. But his successors and followers, who found the system of control a source of undue power and pelf not only made it increasingly complex and inefficient but also became a plaything for the exercisers of lobby power. The voting power of the masses is now much less important.

The only redeeming feature is that many of the lobbyists are today competing among themselves. But if this competition becomes less with an increase in collusion between oligopolists and oligarchs, the future for the country will be very bleak indeed.

While competition among lobbyists should be encouraged, it would be also desirable that they should be registered as in US, required to maintain accounts and diary notes about ministers/officials met in prescribed forms and subjected to strict surveillance by the Vigilance Commission and special scrutiny by the income tax department. It may be further useful to prescribe that their discussions with ministers and designated officials should be taped for subsequent scrutiny by the Vigilance Commission, if necessary. In cases where such record of discussion cannot be kept, the minimum that should be done is for the minister or the designated officer concerned to make a note in the file of the names of the non-official persons who had talks with him about the case under consideration.

A system of surprise annual check of the activities of a small sample of lobbyists may also be usefully introduced. A similar sample check of cases of undue delays and queue jumping may be a useful supplement.

For cases involving grant by government of large benefits (exceeding a prescribed limit) to private parties, it would be desirable to require the deciding minister or senior officer concerned to give public hearing (open to the press) to the registered lobbyists of the contending parties, following procedures somewhat analogous to those of a civil court, before taking a final decision.

Such measures may be objected to as being unduly burdensome for the administration. But the situation has today become so serious that mere moral preaching may not be enough. Some deterrent measures have now become unavoidable, at least for the next few years, until the lobbying and corruption come down to the level of, say, the early 50s.

Federal Financial Flows

Growing Imbalance

I S Gulati

Uneasy Federation: The Political Economy of Central Budgetary Transfers in South Asia by Hiroshi Sato; Institute of Developing Economics, Tokyo, 1994.

In every country of South Asia, institutions concerned with budgetary transfers all reflect sharp political divisions in the midst of both inter-regional imbalances and ethnic strife. [At the same time] these institutions represent the most substantial element within the state integration process.

IT is this assessment of "the centre-local relationship" that informs the author's study of what he refers to as "financial adjustment institutions" in south Asia, especially India and Pakistan, even though these two have "large differences" in regard to "the mix and scale of central budgetary transfers".

The author is a political scientist from Japan "working on contemporary South Asian history". He has covered "the institutional development of centre-local financial transfers [in South Asia] from colonial times up to the initial years of the 1990s". The approach Sato adopts is that "central governments do not rely solely on sets of abstract equity norms in adjusting their fiscal relations with their counterparts on the local level". Rather, "special social and/or political factors" create conditions "which make it inevitable that at least a part of the sources that may be pre-empted by the central government will be transferred to local governments". In the disposition of the budgetary transfers, again, political considerations play their part, determining as they do the central government's policy.

In the author's assessment of central budgetary transfers in India—the data relied upon for the analysis pertain to the period 1972-84—the flows are, as indicated already by Indian experts on the subject, "becoming increasingly retrogressive to state incomes, due to policy measures". In this context, Sato also highlights that "discretionary transfers, which account for one-third of all budgetary transfers, now tend to flow into the wealthier states in the form of loans to bolster their investment activities". Basically, of course, "it is the ability to attach strict conditionalities that makes this form a convenient means for imposing restrictions determined by the central government". In the context of Bangladesh's development grants to the 'upzilas', the author notes that the so-called decentralisation through this sort of transfers "is really a disguised form of centralisation in terms of the function performed by these transfers in strengthening the political base of the ruling regime".

The author's analysis of the state level fiscal structure leads him to identify four types of such structures as they have evolved over the recent past: "(1) states like Kerala, West Bengal and Andhra Pradesh with large social spending shares; (2) states like Punjab and Haryana with large infrastructural spending shares and large overall spending levels; (3) states like Maharashtra, Gujarat and Karnataka which emphasise agriculture, but are fiscally strong; and (4) states like Orissa, Bihar, Madhya Pradesh, Rajasthan and Uttar Pradesh, mainly in the 'Hindi belt', which also put relative emphasis on agriculture but are fiscally weak with low absolute levels of expenditure." Given the "dependent, often strained, fiscal relations" of the states with the central government, the structural disparities have got aggravated over time by the sort of policy pursued by the central government towards state finances which, according to the author, "can be said to be 'limiting' with respect to rises in social spending shares and to be 'supportive' with respect to investment activities carried on by the wealthier states". Naturally, therefore, the policy "lacks impact for increasing shares of social spending, resulting in low level SDP states being unable to escape the quagmire of low level development expenditure"

While the author is concerned that the share of total central transfers accounted for by discretionary transfers may rise even further "unless conscious efforts are made to prevent that from happening", he perceptively notes that the imbalance between central and local finances is "most telling" in South Asian countries "when we look at authority over the procurement and distribution of capital receipts", given the situation in which "state/provincial governments are normally not permitted to participate directly in the market for capital funds and thus are supplied with capital loans by the central governments, resulting in dependence by the former on the latter and the appearance of internal debt trap patterns".

The restrictions on state/provincial borrowing extend to foreign borrowing as well. In fact, loans of foreign aid funds for local projects do not go directly to the state/provincial governments. They have to pass through the centre and fall "within the same framework of centre-local relations". But there is a difference between India and Pakistan. While in India, foreign aid funding is pooled and the centre "lends to the states under uniform conditions", Pakistan, on the other hand, lends such funds under the same conditions as are applied by each foreign government or agency.

However, with foreign aid funds bypassing local governments and "going directly to public enterprises"—in India this is found to be the case in electric power, housing and urban development—the activities of these enterprises, the author observes, "can either supplement or erode the fiscal activities of central and local governments".

Although, as the author notes at the very outset, budgetary transfers to local bodies, as distinct from state/provincial governments, is very small in Pakistan as well as India and public finance is "dominated by the central and state/provincial government levels", it is a matter that should not go unnoticed. Sato refers in this context to the recent attempts in India at amending the Constitution "to correct this defect by defining the panchayat system more clearly within the law of the land" and calls for "reforms that give the lowest administrative strata a constitutional place within institutions governing central budgetary transfers, while at the same time assuring fiscal expenditures at these levels based on a predetermined percentage of the GDP or yearly total public outlays".

The author would be sorely disappointed to learn that while the constitutional amendments effected in India do provide a new framework for the local bodies, urban and rural, to function as effective units of self-government and as agencies for local development, the state-level legislations generally go the opposite way in trying to be as restrictive, if not negative, as possible. Hardly has any state legislation shown readiness to commit "a predetermined percentage" of the state government's revenues to the local bodies or give them sufficient freedom to raise their own resources. So the "virtual fiscal starvation at the lowest strata" which he fears might well continue for some time longer despite the newly created facade.

Overall, Hiroshi Sato has done an excellent job of bringing to bear on a topic ordinarily left to experts in federal finance his expertise and insights as a political scientist well versed in historical developments in south Asia. The book is particularly timely in India because the Tenth Finance Commission is in the process of finalising its review of financial relations and making its recommendations as to the extent and manner of central budgetary transfers to the states under the new liberalised economic regime in place since June-July 1991 with the emphasis on reducing sharply the government's fiscal deficit. Hopefully, the commission's recommendations will cover what portion of the central budgetary transfers should go to the local bodies and in what manner and in so doing it will heed the warning of the author that the fiscal starvation of local bodies "stands in the way of efficient [fiscal] management".

A Credo for Post-Columbian World

Vinay Lal

The Blinded Eye: 500 Years of Christopher Columbus by Ziauddin Sardar, Ashis Nandy, Merryl Wyn Davies, and Claude Alvares; The Apex Press, New York, The Other India Press, Goa, 1993; pp 92, Rs 45.

FIVE hundred years have elapsed since Christopher Columbus landed at the island of Gunahani in the Caribbean, an event more popularly rendered as his 'discovery' of America, and these years have not been pretty. In a work that is described as the "world's first post-Columbian manifesto", four distinguished writers, thinkers, and cultural critics, whose voices, among others, constitute the social conscience of our generation, state in plain language that the consequences of the voyages undertaken by Columbus, and subsequently by numerous other navigators, pirates, conquistadores, and colonisers, have been calamitous not only for the colonised but for the entire world. These voyages, write the authors of *The Blinded Eye*, "led to the imposition of a world-view and the installation of a global order through which millions of people, and thousands of other living species, simply lost their rights to exist" (p 2). This argument is, in itself, not novel, which is scarcely to say that it does not stand quite far apart from the dominant view which locates 1492 as the beginning of the 'modern' era and all that which is thus 'good' in life, and even from the somewhat more sensitive view which admits to the horrors perpetrated—knowingly or otherwise—by Europeans but is blinded from recognising that Europe itself became brutalised in the course of its domination over the world. As Ashis Nandy has often reminded us, victory can be more hazardous than defeat, a more onerous burden to bear; in the words of Romain Rolland, "Victory is always more catastrophic for the vanquishers than for the vanquished."[1]

If there appears to be a charge from which the authors of *The Blinded Eye* may have to be defended, it is that they have, in a reversal of roles, rendered Europe into the 'other', not unlike the manner in which Europe banished the rest of the world to the domain of the 'other', and thereby also illustrated the near impossibility of creating an autonomous realm of criticism not already contaminated by European epistemologies. It is only a brave and bold European who will be able to read unflinchingly the massive indictment of his civilisation delivered in *The Blinded Eye*. In the 500 years since the voyages commenced, write Sardar et al, "the generally unhappy features of the European native, his disturbed thinking, his distorted perception and his spiritually barren cultural objectives have been replicated and duplicated mindlessly in all those places and within all those people on whom he sought to impose himself" (p 2). But it is only an untutored and careless reader, one afflicted with "endemic blindness", who will fail to recognise that the authors of *The Blinded Eye* are guided by no mean desire to calumniate the west (much less Columbus), but rather by the concern that the spiritual heirs of the perpetrators of the holocausts unleashed upon the world remain in our midst today. It is the "Columbus within" from which we have the most to fear today, and if there is any emancipation in the world, it is as much for 'them' as it is for 'us'. The utopia of Nandy and his friends, if there is one, lies not in the past, as it does for nationalists and traditionalists for whom there is always the golden age of antiquity, but in the future.

The subject of this work, let it be clear from the outset, is not Christopher Columbus. That Genoan seaman, working for the Spanish monarchy, as though by way of providing an omen for the appropriative strategies of white multiculturalism today, is only an icon, albeit a momentous one, of the unprincipled adventurism of the west, and of the anthropology of a monstrous otherness by means of which the west shaped its understanding of the rest of the world. A great deal has been made of Columbus as an inaugurator of the modern era, of his scientific prowess, and of the visionary impulses that led him on to new and daring quests, but the authors of *The Blinded Eye* put these gross misconceptions to rest. Consider, for example, the widely accepted notion that Columbus was ahead of his time in thinking of the world as round; as Cole Porter was to put it in one of his lyrics,

> They all laughed at Christopher Columbus
> when he said the world was round.

The authors of *The Blinded Eye* note that Columbus did not have to convince anyone that the world was round, as "no self-respecting medieval scholar believed anything else." Medieval European scholarship knew the world as round; the *Mappa Mundi* or World Map of Hereford, which dates to about 1280, is "decidedly circular" (p 10). But it was not only medieval scholars who had, by the 15th century, rejected the 'flat earth' theory, for as one scholar has shown convincingly in a recent work, even people lacking in education believed in nothing but a round earth. The earth was, as it were, "flattened" in the 19th century by American polemicists and scholars, who alarmed at the attack upon Darwin's *Origin of Species* by creationists and theologians, set to establishing that religion had always been an impediment to science.[2] The views of a few believers in the flat-earth theory were construed as being typical of the 'dark ages', and against this backdrop of superstition, medievalism, and presumed hostility to science, Columbus was made to appear as an enlightened man standing at the frontiers of knowledge. Our authors note that Columbus, despite his years of nautical experience, was merely a believer in a small earth, with some preposterous ideas about the size of the oceans and the land mass, and he thus laboured under the illusion that the shortest way to India from Europe was by way of proceeding westward.

Columbus was even less a herald of the modern. Unlike Francis Bacon, for whom the experiment provided the only grounds for truth, Columbus was prone to trust, in the manner of the schoolmen whom Bacon denounced so vehemently, the authority of texts a great deal more than his eyes; and as Todorov has shown so eloquently, Columbus was to construe everything that happened as that which had already been foretold by the prophets.[3] The point need not be belaboured; Columbus was essentially a neo-Platonist, and what is most striking and ironical is that the advent of modernity shoud owe something to a man who could not belong to the modern world. It was "old ideas [making] new departures" when Columbus, carrying with him a "mental geography that included an anthropology of barbarism", set sail for the Indies (pp 18, 20).

Western Christendom, of whose "cultural and ideological personality" Columbus was as good a specimen as any, had, one might say, specialised in the production of images of otherness. The Israelites, as even a cursory reading of the Old Testament suggests, "unambiguously saw the earth as hostile", and they "had an almost murderous conception of it". The hostile attitude to nature, as well as to other cultures, whose gods were perforce to be destroyed, "was incorporated in Judaic monotheism" and "passed on to Christianity as well" (pp 19-20). As for that other great fount of western civilisation, classical Greece, it was predicated on "the separateness of the Greeks from other peoples"; all those who could not speak Greek were reduced to being barbarians. The Greeks also furnished a large

part of what was to become the "medieval iconography of otherness": they introduced the pygmies; the kynokepohaloi or dog-headed people whom Columbus thought he would encounter in India; the Akepheloi, the people with no head and with their eyes on their chest; and the cyclops, the people with only one eye. The Greek world was inhabited with numerous centaurs, minotaurs, satyrs, and hybrid races, all representations of people whom the Greeks saw as essentially different from them. As the authors of *The Blinded Eye* go on to argue, Roman literature is likewise replete with images of barbarous otherness, which eventually found their way into the medieval imagination (pp 19-27). With the shift from the original teaching of Christianity, which focused on the divinity that dwells within, to the emphasis on the historical figure of Jesus himself, Christian history had become "a steadily lengthening chronicle of mass neurosis" (p 28). The drive, initiated by Augustine for "orthodox uniformity", which the authors of *The Blinded Eye* mark as a "major social and political problematique of the west", the "actual idea from which it goes manic and demented", was to render western Christendom into "the most successful totalitarian society known to man" (p 28). Ironically, it was the Christianity of the Inquisition, which visited untold horrors among millions of people, that was to wage a relentless war against the 'barbarous Muslims' as well, and that too at a time when "Muslim Spain was the only multicultural society of European history" (p 31). Let us not forget that Dante, the poet of Christendom, consigned the prophet Muhammad to the Inferno.

The Blinded Eye goes on to delineate the manner in which the "anthropology of barbarism" was brought into the service of European colonialism and imperialism. In the last decade of the 15th century, Europeans set into motion three critical features that were henceforth to constitute the epistemological apparatus of colonialism. Before Columbus even set sail, Spain and Portugal had already decided to carve up the world between themselves: the sole right to possession had been staked. An obliging Pope was to confirm this arrangement in 1493. In the year that Columbus set forth into the unknown, the Jews were expelled from Spain, and European civilisation had once again shown that it was to be characterised by exclusivity. The circle of those who were to be included with the realm of the human, or at least the fully human, could only shrink, not expand. And, finally, having sailed and stumbled upon the Caribbean islands, the Europeans at once assumed the unilateral prerogative to name.[4] The islands were rechristened; lands deemed to be "empty" and "barren" were, in fulfilment of the divine command, peopled with the children of Christ. God had ordained that "waste" was inoffensive to his designs, and as the indigenous people stood in the way of productivity (pp 73-76), their destruction was wrought as much with ingenuous arguments and invocations to biblical teachings as with superior technologies. The stage had been set for the appropriation of the world.

The Americas (and later other parts of the world, such as Australia) no doubt furnished many people celebrated as pioneers, and pioneers they were in inventing new modes of pillage and in rendering the native population extinct. Europe had been speculating about barbarians and strange races for some time; the encounter with the native American was to render this writing into an 'actuality'. Thus the numerous marvels of the east found in early maps, such as the dog-headed people of India, were transposed to the Americas, as in Mercator's world map of 1538 (p 39). The best minds of Europe were now to be devoted to deliberating upon such questions as whether the Amerindians were natural slaves. How could they, a people without faith, living outside the law, be otherwise? Although at least one prominent jurist, Francisco de Vitoria, was inclined against categorising Amerindians as natural slaves, he had no difficulties with slavery as such, and was emphatically of the view that Africans were better as "slaves among Christians than free in their own lands" (p 50). That great chronicler of the atrocities perpetrated upon the Amerindians by the Spaniards, Bartoleme de Las Casas, whose name is routinely and unthinkingly cited as an indication of the west's purportedly unique capacity for self-criticism, and of the quest for 'truth' that has guided the west in its intellectual and political endeavours, nonetheless had a virulent hatred for the "Turks and Moors, the veritable barbarian outcasts of the nation".[5] Las Casas, not surprisingly, had a radical 'other' too, and indeed even his defence of the Amerindians appears quite something else when we consider that he desired the annexation of Indians to be effected by priests rather than soldiers. Similarly Thomas Jefferson, perhaps the most enlightened of the American 'founding fathers' (though it is easier to catalogue what they destroyed than what they founded), could not think of the American Indians as anything but children, and "transcendent necessity" drove him and his followers to incorporating them into their world-view.[6] The view of Jefferson was still somewhat benign, for most of his fellow Europeans, more inclined to think of American Indians (and the residents of Polynesia, Melanesia, and other places) as 'barbarous savages' rather than 'noble savages', had already invented cannibalism. No greater sanction was needed to subjugate or eliminate indigenous populations. Once a few images of something that purported to be cannibalism had been generated, they were endlessly circulated, and iteration would now perform the work of colonialism.

Much of the terrain covered in *The Blinded Eye* will be familiar to critics of colonialism and others who are in the habit of serious reading, but it is the particular inflection which the authors furnish to their reading that gives their work a political edge beyond the ordinary. On the subject of cannibalism, for instance, the critical question is scarcely whether the case for cannibalism has been proved or not; rather, the European obsession with cannibalism serves as "a pointer to the power of the European mind to overwrite the world" (p 49). As they argue, "the invention of the other was a vital tool for European self-consciousness", and when the "unitary framework that united European self-consciousness was under stress", the need to redefine what was European led to the perpetration of greater horrors without (p 42). Carrying the story onward into the era of British and French imperialism, one could certainly state that the English began to gain some understanding of themselves as English only after they had acquired their colonies overseas; and although the authors of *The Blinded Eye* do not say so, it is also certainly arguable that a great deal of British colonial discourse has as its real subject the Englishness of the English. Europe has never been able to do without its others; and though that may well be true of some or all other civilisations as well, nowhere was this other so unfailingly, thoroughly, and violently marked as irremediably, radically different. It would be a mistake, moreover, to presume that otherness was more marked when clearly inflected with race; "no design the English attempted to impose on India or north America or Africa was not first attempted on their own countrymen and later, with greater violence, on the Irish and Welsh as well" (p 2). One has only to read Marx's account of the Highland Clearances to understand what violence the English were capable of against the Scots.

This narrative of the European production of otherness is necessarily cryptic, liable to be contested at every turn, and the forays into the "anthropology of barbarism" are bold; some readers may get the impression, which would be wholly erroneous, that violence and colonialism were a monopoly of the west. In the preceding 500 years, however, colonialism has largely been a matter of the imposition of the west upon the rest of the world. From the point of view of the victim, there may not be much to choose between different forms of violence, but it is the contention of the authors of *The Blinded Eye* that the violence of European conquest, colonialism, and subsequently fascism is altogether of a different kind than

the violence associated with 'traditional' societies. In their words, the "violence born of anger or hatred", often tinged with "moral fervour, however distasteful", or the ritualised violence which did not completely render the victim into an other, "were both gradually substituted by dispassionate, amoral 'banal' violence based on mechanical, fully secular cost calculations" (p 80). The world-view of the master has had no room for the slave except as someone who was not fully human, and often no better than a thing, but the slave's cognition never rendered the master into someone other than a human, though no doubt a debased one.

As I have argued, Davies, Alvares, Sardar, and Nandy look to the future, and accordingly they turn their attention, in the concluding pages, to the "Columbus within". If Europe's imposition of itself on the 'new world', Asia, and Africa first came in the form of colonialism and imperialism, now it is in the name of 'development'. Every non-western regime "operating within the European concept of the nation-state" has committed itself to a "gargantuan exercise in social engineering" (p 82), and numberless crimes continue to take place in order to prod supposedly slumbering peoples into becoming active participants in the project of modernity, in the massacre of their own civilised selves. In the earlier stage of the domination of European knowledge systems, the past of Europe was conceived as the present of non-European societies; in the script that is being written now, the future of the non-European world is only Europe's present. In this nightmarish scenario, the destiny of the non-European world is to live in the quagmire of backwardness, and in envious and emasculated emulation of a world that will never be within its grasp.

Columbus is now firmly installed within each of us, and his dislogding will require more than the affirmation of 'universal rights' and what is called identity politics. Proclamations from podiums will not carry us very far. From the vantage point of today, as we look back on the manner in which the west has been able to retain the management of dissent, so that dissent has to appear in those forms which the west has construed as being legitimate, it becomes frighteningly clear that the "real achievement of the blinded gaze of *oculus mundi* is that even today all negotiation with western civilisation must be carried out through the west's conventions. To secure amendment or concession, real people have to act either as if they were the other invented by Europe or as if they have become part of the west" (p 87). As with the American Indians, so once again the choice being offered the rest of the world is either enslavement or conversion. But perhaps one need not despair altogether, for if at one time only the west had its theory of the other, today the other too is developing its theories of the west (p 85). That may lead the west to a different understanding of itself; it may also lead to the resuscitation of those submerged and dissenting traditions of the west which, marginalised by the homogenising drive of colonialism, today are to be found largely in the non-west. We should read *The Blinded Eye* as a clarion call for emancipation from the blindness with which the west is afflicted and for the recovery of "our plural pasts, and through them our plural futures" (p 90). as the authors put it in their final words, that is the "only means to reclaim the debates silenced by Columbus' success. And to survive".

Codified Hindu Law

Myth and Reality

Madhu Kishwar

There is almost no principle introduced by the Hindu personal code which did not already exist somewhere in India as accepted law. On the other hand, there were several existing, much more liberal principles which were decimated by the Hindu Code. In their determination to put an end to the growth of custom, the reformers were putting an end to the essence of Hindu law; but they persisted in calling their codification 'Hindu'.

I

IN the first decades of Indian independence, the codification and reform of the Hindu personal law was hailed as the symbol of the new government's supposed commitment to the principles of gender equality and non-discrimination enshrined in the constitution. The history of this legislation and its consequences over the years are in many ways a good example of the gap between governmental promise and performance, and the course taken by state-initiated social reform—a process that began with the establishment of British rule in large parts of India.

The attempt to codify Hindu law was begun in the late 18th century because the colonial rulers wanted to bring under their judicial purview aspects of the social and political life of diverse communities which all erstwhile rulers had never encroached upon. The establishment of British rule marked an unprecedented break from the past. Prior to that no rulers had sought to intervene in what were considered as the internal matters of the 'jat' or 'biradari' organisations of various communities, no matter how far-reaching the changes introduced at the top. For instance, during Mughal rule, the Islamic law explicitly recognised the traditional community-based institutions for resolving disputes. The Mughal court reserved to itself exclusive jurisdiction only in matters they considered crimes against the rulers, as well as in fiscal administration. Most family kinship disputes were not brought before Muslim officials. Rules for dispute resolution differed considerably from one caste to another and from region to region.[1]

The Englishmen who came as traders in the 17th century were befuddled at the vast diversity and complexity of Indian society. Having come from a society where some aspects of family and community affairs came under the jurisdiction of canon law, they looked for similar sources of authority in India. Thus began a new kind of study of ancient 'shastras' to help the British develop a set of rules for governing contemporary Indian society

During Warren Hasting's tenure, disputes regarding inheritance, the laws regarding marriage, caste and religious usages or institutions were to be settled for Hindus according to the laws of the 'shaster'. Why these subjects and not others? To quote Duncan Derrett: "Hastings and his colleagues were ... predisposed to see the division of topics of law in terms of the contemporary English division..."

They assumed that just as the European marriage laws were based on Biblical tenets, so must the personal laws of various communities draw their legitimacy from some fundamental religious tenets:

> All matters of marriage and divorce, and all questions of testaments and distribution of goods, ... all matters of religious worship and discipline, excommunication and so forth were within the exclusive jurisdiction of the Bishops' courts, and the law was ecclesiastical law .. When the Anglo-Indian judges sent ... for 'opinions' ('vyavastha') on Hindu law from the pandits, and acted upon these certificates without bothering to see whether they agreed with others given by the same persons in the like circumstances, they were imitating the practice of the King's bench or the Common Pleas. This was of a piece with the error perpetuated by Sir William jones, that brahmins were 'priests'. Very few brahmins were priests and there were priests who were not brahmins: and similarly pandits were not bishop's officials, or anything of the kind.[2]

There was no single or uniform body of canon law or Hindu pope to legitimise a uniform code for all the diverse communities of India, no Shankracharya whose writ ran all over the country. But that did not prevent the British from searching. An even bigger mistake of the British was that at this point they took no steps to collect evidence of local or caste custom. This led to wide discrepancies between the opinions or reports of pandits in different courts. Often same pandits gave different opinions on similar matters. In order to arrive at a definitive grasp of the Indian legal system, the East India Company began to train pandits for its own service and began to patronise 'shastric' education. This included setting up of a Sanskrit College at Banaras and at Calcutta. However, since the effort began in eastern India, the shastric learning promoted by the company had a visible eastern bias. These pandits could report the law mostly based on the school of Benares and Mithila or the Bengali school. Southern schools of law were conspicuous by their absence.

In 1772 Hastings hired a group of 11 pandits for the purpose of creating a digest of Hindu law. This was made to order text in which the pandits followed the authority of their paymasters The use of these Sanskrit pandits to interpret the customary laws for the benefit of courts inevitably brought in a heavy Anglo-brahmanical bias. This work was translated into Persian and from Persian into English. In March 1775 Hastings sent this work to London with a preface on its cultural background. In 1776 it was printed in London under the title : *A Code of Gentoo Laws, or, Ordinations of the Pundits.*[3] This could be called the first serious, though far from accurate, attempt at codification of Hindu law by the judges at all levels. The topics included debt, inheritance, civil procedure, deposits, sale of a stranger's property, partnership, gift, slavery, master and servant, rent and hire, shares in cultivation of lands, fines for damaging crops, defamation, assault, theft, violence, adultery, duties of women, etc.

This codification could not put an end to conflicting opinions. The British began to increasingly mistrust the pandits feeling that the latter were misleading the court or that they favoured the interests of their own caste. They were also getting increasingly impatient with having to deal with a vast range of customs which had no shastric authority to back them. The resulting confusions and corruption led William Jones

to work on a more 'definitive' code of Hindu law comparable with Justinian's *Corpus Juris* for the use of European judges in India. He was determined that "the British should administer to [the Indian people] the best shastric law that could be discovered" and was determined to free the British from their "dependence on the pandits". To quote William Jones: "I can no longer bear to be at the mercy of our pandits, who deal out Hindu law as they please, and make it at reasonable rates, when they cannot find it ready made."[4]

The code, prepared by Jones with the help of pandits, had a strong bias in favour of the Bengal school. He then went on to translate *Manu Smriti* which became one of the most favoured texts of the British. It influenced oriental studies in the west far more profoundly than it had ever influenced the administration of law in pre-British India. Despite repeated failures, the British would not give up their search for an authentic text of Hindu law written by a Hindu shastri. After Jones, Colebrook tried his hand at a similar compilation.[5] In a few years time Colebrook's translations of the Mitakshara and the Dayabhaga[6] became the two most frequently quoted and relied upon sources in court judgments. In the mean time several Sanskrit scholars had attempted to write legal treatises to meet with the British demand. Nevertheless the work of European authors on shastric law came to be trusted and used in preference even to the genuine Sanskrit shastric works.

Thus grew the myth that Hindus were governed by shastric injunctions. These new law codes, backed by the authority of British courts, began to make alterations in custom, even when the British law provided for protection of the latter. Since then custom has been forced to struggle against the Anglo-shastric law brought into existence at the behest of the British, which was assumed to be the personal law of Hindus. The literal and obstinate adherence to shastric rules, misunderstanding their original purport, resulted in making the Anglo-Hindu law far more rigid than the shastras. In their attempt to make the shastras more definitive, the British forced it towards greater uniformity.

This ossified Anglo-Hindu law is what the Indian parliament set out to reform in the first decade of Indian independence. The Congress Party was then dominated by lawyers trained in British law or people like Nehru and Ambedkar who had studied law in England. They were not just English educated but also educated in English law and had consequently imbibed all the colonial biases regarding the functioning of Indian society as well as the changes that were supposedly needed to 'modernise' it. This is a major reason that the reformed Hindu law is in conformity with 'reforms' initiated during British rule.

The Hindu code bill began to be drafted in the 1940s. After a long and chequered history, including various attempts to scuttle it, a Hindu code bill was presented to the legislature in 1947, and referred to a select committee headed by the then law minister, B R Ambedkar, in 1948. It faced tremendous opposition both inside and outside parliament. For example, among the written statements submitted to the Hindu law committee in 1945 a large majority were opposed to the notion of codification and a substantial number of those who supported it offered only qualified support. The Congress itself was sharply divided on the issue. In the face of this opposition from within and without, the government finally decided to split the bill into four parts and pass it piecemeal. In this process, the legislation underwent substantial change. By the time the last of the four acts was passed in the mid-50s, they were very different not only from the original draft code but also from the code as it had emerged from the select committee headed by Ambedkar.

Yet, even these highly watered down pieces of legislation were hailed as nothing less than revolutionary by their proponents in parliament, using rather exaggerated rhetoric. This rhetoric remained basically unchanged over the years that the Hindu code was debated in parliament, and seemed to have little relationship to the actual laws being debated. The rhetoric seems to have had more to do with the rhetorician's self view—a paradoxical blend of pomposity and self-contempt—derived from acceptance of the British ruler's view of Indian society. Thus, in 1948, B V Keskar, constituent assembly member from UP, remarked on Ambedkar's Hindu code bill: "... I do not think there has been any bill so radical and so revolutionary which is trying to change the very foundations of Hindu society, a society which has remained fossilised for the last thousand years."[7]

And, in 1956, when the Hindu Succession Act was passed in so altered a form that even its most ardent supporters felt compelled to see it as something of a fraud on women, the hyperbolical rhetoric nevertheless continued. To quote S S More:

> ...our past which created and perpetuated the caste system... which allowed the sudras to remain in abject slavery, is still hanging over us; but we are striving to snap the bonds of the past and march as steadily and firmly as possible towards a new horizon, towards a new heaven, where the socialistic order shall prevail.[8]

This rhetoric functioned in two ways. First, it projected a myth that Indian women were absolutely equal under the new laws. By a curious sort of myopia, or rather double vision, it became possible simultaneously to give less than equal rights to women, even in newly enacted laws, and yet to claim that equal rights had been given. Thus, Mulla's *Principles of Hindu Law*, the standard scholarly text on the subject, states in the preface: "The outstanding feature of the changes made in the law is that all disparity in the rights of men and women and disabilities based on...sex are eliminated in matters of marriage, succession and adoption."[9] And again later: "Male and female heirs are now treated as equal without any distinction."[10]

This in a book which documents at length the glaring disparities that persist, especially in matters of succession and adoption. At the popular level too, the notion came to prevail that the reformed law was not only an ideal piece of legislation but had also, like a magic wand, actually removed all injustices. Thus, on May 10, 1956, the *Hindustan Times* carried an advertisement for G P Sippy's film *Shrimati 420*, which proclaimed:

> Red Letter Day in the History of Social Reform! Parliament Passes Hindu Succession Bill and Removes Age-Old Injustice to Women! Here is a picture to uphold these ideas which blazes a new trail in revolutionary social dramas!

This is not to suggest that the euphoria served no purpose or was merely so much hot air. It did help to establish the notion of women's equality as a desirable ideal to which the Indian polity was to be committed. It is noteworthy that all the members of parliament opposing this reform in Hindu law, whether they were from the Congress or from other parties such as the Hindu Mahasabha, never failed to preface and end their speeches with an emphatic disclaimer of any intention to oppose justice for women. This establishment of some minimum consensus on the need to protect women's interests was in itself a worthwhile achievement, on which law minister Pataskar commented when the most controversial act, the Hindu Succession Act, was finally being debated in 1956: "I am happy that in spite of some very passionate speeches... the majority of the members of this house...are in favour of doing justice to women...whatever the other differences."[11]

However, the gap between rhetoric and reality was too large to remain unnoticed. Not only the opponents but even some of the proponents of the acts repeatedly pointed out that they fell far short of equality. When law minister Biswas, in 1954, claimed that "the delay" was "fully justified" because over the years the "bitter opposition" to the bill had died down,[12] Hukum Singh pointed out: "It is not the public opinion that has changed but...the government that has changed its attitude...This is not the original bill...The Hindu code has practically been given up by this government."[13]

Why then the insistence on codifying and unifying Hindu law? There seems to be a fascination, among the social reformers in particular and the English educated elite in general, with uniformity as a vehicle of national unity. In the vein of British distaste for polytheism and glorification of monotheism as somehow intrinsically morally superior, the reformers express disgust with the diversity of Hindu law as practised in different regions, and with its complexities. The reformers perceive themselves as modernising woodcutters wielding the axe against the mystifying jungle of Hindu law. The destructive metaphor of cutting down trees rooted in the earth is a revealing one. B V Keskar's opinion was widely shared among the zealous reformers:

> ...the present day Hindu law is a maze; it is a jungle like the tarai or sunderbans in which all sorts of practices and traditions come up...the time has come when this maze of traditions and counter-traditions should be put an end to and we must rationalise and consolidate the law.[14]

Time and again, the reformers put forward the argument that uniformity is necessary, without explaining why, simply assuming that uniformity is an unquestioned good. One such typical statement by S C Shah: "We have had Hindu law varying from place to place, province to province, having all kinds of local customs and family customs...it is a very great thing that we will, for the first time, have a uniform code at least for the Hindu community."[15]

All who questioned that uniformity was a great thing were labelled and dismissed by the 'progressives' led by Nehru as reactionaries. However, a careful study of the opposition shows a wide spectrum—ranging from mindless idealisation of the customary Hindu law, including its discriminatory aspects, to more thoughtful advocacy of retaining diversity, recognising that community-based law had greater implementability, and allowed people more options. Some argued that diversity was not itself an evil, and, more important, that Hindu law had not been imposed by the state or other authority from above but had grown from popular consensus and that this character should be preserved. Kameshwar Singh, a Congress MP from Bihar, tried presenting this viewpoint but to no avail: "The diversity perceptible in different parts of the country goes a great way in establishing the fact that popular acceptance and not imposition from any central political authority has been the sanction behind the personal law of the Hindus..., we should not take the seeming diversity as an evil which must be instantaneously removed."[16]

At one level, then, the question was also one of how far the state should take it upon itself to interfere in people's personal and community lives. Ambedkar was among those most enamoured of the state's right to run people's lives. He declared that there was no sphere in which the state could not interfere: "People talk about customs in the country. Well, why have customs grown?...I think the answer is...that so far as this country is concerned, there never was such a thing as parliament..."[17]

Disregarding an interjection regarding the co-existence and legal validity of common law with the parliament in England, he went on:

> What other way was left open to regulate their life except to make their own custom, because there was no parliament...? But when we have got a parliament, the function of which is to make law, the question that we have to ... consider is whether we are going to allow the people as such who are outside the parliament to have a parallel authority to make their customary laws...?[18]

This perception of the state as an instrument of social reform to be imposed on people without creating a social consensus derives essentially from the norms of functioning inherent in colonialist state machinery and ideology. The English educated elite among the Indians had faithfully imbibed the colonial state's ideology, projecting itself as the most progressive instrument of social reform, failing to realise that many of these enactments (such as the Sharada Act) remained paper tigers of which people were not even aware. The contempt for Indian society, labelled backward, uncivilised and degenerate, was all pervasive. Notice the words used by Ambedkar: "...some communities like the Hindu community needed the reform so badly— it was a slum clearance."[19]

Having argued that customary law amounted to "anarchy" and that it had evolved only because India lacked a parliament, he also put forward the self-contradictory argument he had picked up from the orientalists that Indian society was static:

> ...this society is an inert society. The Hindu society has always believed that law making is the function either of god or the 'smriti' and that Hindu society has no right to change the law. That being so, the law in Hindu society has remained what it was for generations... Society has never accepted its own power and its own responsibility in moulding its social, economic and legal life. It is for the first time that we are persuading Hindu society to take this step.[20]

The derivation of this terminology from that of the British rulers is apparent. It was a commonplace of 19th century British thought to label Indian society stagnant and resistant to change. The diversity of Indian society and culture bewildered the British rulers and made the task of centralised governance difficult, accustomed as they were to the relatively far more homogeneous societies of Europe. Hence their desire to homogenise Indian society, its norms and practices, and to wipe out all those diversities that they could not comprehend. This attitude was inherited by the English-educated rulers of independent India along with the machinery of colonial government that had fully internalised it.

Arrogating to themselves the status of 'first time' reformers only betrayed the ignorance of the Nehru camp. The evolution of law in precolonial India provides ample evidence of change and reform. To take the most obvious example, the institution of the dayabhaga system by 'jimutavahana' which is considered as the more liberal and reformed school over the more orthodox 'mitakshara'. However, the latter was not static either. Four major schools evolved within mitakshara. There is almost no principle introduced by the Hindu code which did not already exist somewhere in India as accepted law. There were, however, several existing much more liberal principles which were decimated by the Hindu code, and have not been restored even today. (I will provide examples of some of these later in this paper.) In their stated determination to put an end to the growth of custom, the reformers were in fact putting an end to the essence of Hindu law, yet they persisted in calling their codification 'Hindu'.

II

The smritis are collections of precepts written by rishis—that is, sages of antiquity. All of the smritikars stress the importance of custom and usage. But the very same authorities who insist that these smritikars were the founding fathers of Indian jurisprudence themselves admit that ethical and moral obligations were regarded by these exponents of dharma as of more importance than legal obligations. Justice Desai in his authoritative introduction to Mulla's treatise on Hindu law says that "...much of the traditional law of ancient India would be termed as 'morality' because that law was not 'a direct or circuitous command of a monarch or sovereign to persons in a state of subjection to its author'".[21]

Dharmashastras were not strictly religious treatises either. Dharma itself means the aggregate of duties and obligations, religious, moral, social and legal. This code of dharmic conduct was expected from each of the social roles a person performs. But there is no attempt to insist on a universal code for all of humanity. It is meant to be situation and time specific as well as person and place specific rather than an immutable set of laws. And the authority to change or start

new customs too lies with not just the biradari but also with the 'kula' or family. Narada states: "Custom is powerful and overrides the sacred law".[22] *Manu Smriti* itself, which was sought to be provided with the halo of final authority, stresses: "A king... must inquire into the law of castes (jati), of districts (ganapada), of guilds (shreni), and of families (kula), and settle the peculiar law of each" and goes on to add: "Thus have the holy sages, well knowing that law is grounded on immemorial custom, embraced as the root of all piety good usages long established."[23]

Even some of those smritis which deal exhaustively with various topics of law and are generally referred to as codes were not codes in the strict sense. The surviving known smritis were compiled at different times and in different parts of the country and consequently differed considerably from each other. But characteristically, none of the smritikars pick up cudgels with or deny the authority of other smritikars in an attempt to prove that theirs is the most authoritative version of a single code of conduct. Instead, they assume that the various codes should coexist, not challenging each other:

> The smriti was not autonomic law which is the result of a true form of legislation or is promulgated by the state in its own person. It was not imposed by any superior authority...The general effective motive, according to these smritikars, was observance of dharma and the sanctions recognised by the people themselves...one view of the genesis of legal institutes [codes] was that the king and the law were created by the people.[24]

Most of the leading smritikars make explicit statements to that effect. For example, Medhatithi and Vijnaneshvara, as also the *Mahabharata* and the *Arthashastra* of Kautilya, maintain the view that law as enjoined in the vedas and the smritis was of popular origin and the sanction behind that law was not the will of any supreme temporal power.[25]

The smriti of Yajnavalkya gives a list of 20 sages as law givers. The mitakshara explains that the enumeration is only illustrative and dharmasutras of others are not excluded. There is no attempt to assign a hierarchical order to the authority of their authors.

Brihaspati (one of the 20 important smritikars) ruled that a decision must not be made solely by having recourse to the letter of written codes since if no decision was made according to the reason of the law or according to immemorial usage, there might be a failure of justice. Acting on these principles the rishis abrogated practices which had come to be condemned by the people and ordained and prescribed rules on practices and customs which had come to be recognised and followed by the people.[26] An oft-repeated maxim was that reason and justice are to be given more regard than mere texts.

The dharmasutras of Gautama, Baudhayanaa, Apastamba, Harita and Vasishtha are accepted to be the most ancient of those extant and deal with duties of human beings in various relations. However, they do not pretend to be anything more than compositions of ordinary mortals and the writers do not hesitate to make clear that often they are merely "compilers of traditions, handed down to them and clung to that position even when introducing changes and reforms."[27] Composed in different parts of the country at different times, they were not bodies of law struggling with each other for supremacy. Each author accepts the validity of other schools of law. For instance, Apastamba's work, which is believed to embody the customs of certain regions of southern India, is one of the most respected sutras. While emphasising the view that the vedas were the source ('pramana') and nucleus of all knowledge, Apastamba takes care, at the end of his work, to impress his pupils with the statement: "Some declare that the remaining duties (which have not been taught here) must be learnt from women and men of all castes" and goes on to add: "The knowledge which...women possess is the completion of all study."[28]

The *Gautama Dharmasutra* which is believed to be the oldest of the extant works on law lays down the injunction that the king is duty-bound to preserve the time-honoured institutions and usages of different communities—cultivators, traders, herdsmen, moneylenders and artisans. The king is not expected to impose his laws on others, only to preserve and implement. The adherence to the doctrine of accepted usage and the enjoined duty of the interpreter of law is to see that customs, practices and family usages prevailed over any outside writ. This distinguished Hindu law from those of societies which adhered the idea that the word of god came to them in the form of a sacred text.

There is no concrete evidence of which caste and community's customs were being documented by particular smritikars If at all they had any practical application, it was local and specific to certain groups. The rishis who compiled the smritis did not exercise temporal power nor do they owe their authority to any sovereign power. Therefore, what they enjoined was not intended to be imposed from above on any community. The authority their codes enjoyed depended on the reverence they were able to elicit and the willingness of groups and individuals to submit issues to judgment under its provisions. This reverence could not be imposed by force as modern judges do by threatening to punish on a charge of "contempt of court" people who criticise them or ignore their judgments. Most important of all, a dharmic code, in their view, was one which was "agreeable to good conscience".

Gandhi is one of the few modern social reformers to have understood this simple principle. By this means he could propose a radical agenda of social reform for all communities seeking sanction from no extrinsic authority—textual, religious or temporal—and initiate a far-reaching campaign for social reform, declaring:

> Every word of the printed works passing muster as 'shastras' is not, in my opinion, a revelation... The interpretation of accepted texts has undergone evolution and is capable of indefinite evolution, even as the human intellect and heart are... Nothing in the shastras which is manifestly contrary to universal truths and morals can stand... Nothing in the shastras which is capable of being reasoned can stand if it is in conflict with reason.[29]

He then goes on to add: "My belief in the Hindu scriptures does not require me to accept every word and every verse as divinely inspired...I decline to be bound by any interpretation, however learned it may be, if it is repugnant to reason or moral sense."[30]

He could present himself as a modern-day sage calling upon people to overthrow customs that did not conform to principles of equality and justice or went against "good conscience" because he had inherited a tradition whereby the power to change its own customary law rested with each community.

This continues to be in some essential ways a living tradition in India. Each caste and sub-caste and occupational grouping continues to assert its right to regulate the inner affairs of its respective community and does not pay much attention to either ancient textual authorities or modern parliament-enacted laws. When a person or a group in India seek to defend a particular practice or resist following something being proposed, the common statement one hears across the country: "*hamare yahan to aisa hi hota hai*" or "*hamari biradari mein to yeh nahin chalta hai*" ("This is how it happens in our community" or "In our biradari we don't do it that way".)

In direct contravention of the genius of the indigenous law, the British rulers, through the privy council, laid down that only such customs would be recognised in law as were ancient, observed without interruption, uniform, obligatory, and not 'immoral" or "opposed to public policy". The legislators in independent India unquestioningly incorporated this formulation into the Hindu code, thereby not only enabling both themselves and judges arbitrarily to overturn any custom by labelling it 'immoral' but also

stultifying custom itself. As Ambedkar succinctly put it: "What are we doing? We are shutting down the growth of new customs. We are not destroying existing customs."[11]

The Indian legislature thus completed the process, begun by the privy council, of trying to homogenise and stultify customary practice by imposing on it norms of their own devising. Although the British claimed that they only interpreted Hindu (or Muslim) law and did not interfere with it, in fact by the very process of setting up their law courts for judicial interpretation (which acquired the force of law through the notion of binding precedent) the British altered the law—in some ways beyond recognition and irretrievably. Let us take a couple of examples—many more could be cited. According to Vijnaneswara, in the mitakshara, 'stridhan' (women's wealth) is explicitly defined as including wealth acquired by inheritance and partition. But the privy council in 1912 discarded this, deciding that neither wealth inherited from a male nor wealth inherited from a female becomes a woman's stridhan, and that, therefore, on her death, it does not pass to her heirs but reverts to the heirs of the person from whom she inherited it. The Maharashtra school was in certain respects the most liberal of the different schools of Hindu law in giving recognition to the rights of women. The founder of this school, Nilakantha Bhalta, does not merely present traditional solutions but suggests that he evaluates them keeping in view the current needs of society. Even though in the early years the law courts took this school seriously, it slowly was eclipsed in favour of more conservative schools. The same happened with other more liberal schools. For instance, in 1908, the Bombay high court rejected the *Balamabhatti* of the Maharashtra school which was favourable to women. This work was written by a woman named Lakshmidevi, who expressed very liberal views and gave well-reasoned interpretations in furtherance of the rights of women. At one time considerable importance was attached to the opinions of this author by the Bombay high court but in later decisions the same court ruled that this text "cannot be accepted without due caution and examination".[12] Another very telling interpretation relates to the definition of "legal necessity", for which a 'karta', or manager of joint family property, can alienate it, to include "payment of government revenue".[13]

These court judgments, over time, became more authoritative than the shastras from whom they supposedly derived their authority. Even though in the beginning these judgments affected only the disputed parties, they slowly came to be seen as binding on the entire community because British jurisprudence gave the weight of law to judicial precedents. This too added an unprecedented rigidity to Hindu law. The numerous high court, supreme court and privy council decisions gave rise to a mass of case law which came to supersede not only customary usages but the shastric texts on which they claimed to base their pronouncements.

Perhaps even more important than their remaking of the law through misinterpretation was the British attempt at destruction of people's own institutions of arbitration and settlement. A distant law court, functioning in a foreign language, and observing bewildering procedures imported from a foreign country, was to administer laws which had formerly been understood and decided at the community level. When, for instance, it is said that the Bombay school of mitakshara law recognised more female heirs than did the other three schools, this meant that people in that area by traditional practice recognised and honoured the claims of those heirs. Once the British courts took over, however, it meant that they translated—and often mistranslated—certain texts, arbitrarily rejected some, including those that favoured women, and decided disputes in a way that took power completely out of people's hands, leaving them at the mercy of English educated lawyers.

It was repeatedly pointed out, in the course of the debates on the Hindu code, both in and outside parliament, that codification might well lead to making life more difficult for people, unless machinery was set up to implement the law easily and swiftly. Language was the first obstacle. For instance, Venkatraya Sarma pointed out: "The codification of Hindu law in English will give to it a permanent alien character..."[14]

The second obstacle was the expense and delay involved in litigation. This was most evident in the case of divorce, which the reformers claimed to be introducing for the first time to Hindu society, even though they were repeatedly told that formal divorce existed amongst large sections of the population, and *de facto* divorce even among the upper castes, who claimed in theory that marriage among them was indissoluble. Despite being reminded repeatedly over the years that legal divorce would be inaccessible to most people unless institutions were established and implemented for this purpose, the government took no steps to do so. In 1945 the Madras Provincial Backward Classes League, in a statement ardently supporting the Hindu code, had said:

> Divorce ...is also welcome—but the procedure for obtaining divorce should be simplified and made within the easy reach of the poor backward classes who constitute nearly 65 per cent of the Hindu population in this province. We are poor and cannot afford...expensive measures of going to the court for obtaining a divorce. I suggest, therefore, that some government officers should be entrusted with this power in each district for instance, district registrar of assurances, sub-registrar or panchayat officers.[15]

Thereafter, too, each time the divorce provisions were discussed in parliament, this point was raised. In 1951, for example, Babu Ramnarayan Singh of Bihar said: "In...90 per cent of the society, we know that divorce is a daily routine, ... Two, four or five of them sit together, both the contending parties come and they break some stalk of grass; and their mutual relations are broken—this constituted the 'divorce'. Not a penny was to be incurred on this nor any botheration...Now all of them will have to go to the district judge for divorce, what a lot of expenditure and botheration will this procedure mean?"[16]

He then went on to remark that the effect of passing such laws without creating an implementation machinery would be that people would ignore them and continue to rely on their own institutions: "We have panchayats and panchs; and [since] in our country customs and usages are pliable, they will continue to hold good and people would accept them automatically...What the country thinks, and what she needs, government never worry about it ...the government go on spending money lavishly...go on passing baseless and futile laws against the will of the public."[17]

C D Pande of Uttar Pradesh gave a graphic account of the reality of government functioning—how it worked to harass rather than to help people, and therefore how its arrogating to itself more powers could only mean more harassment unless people had the wisdom to keep a healthy distance from this tyrannical machinery:

> They do not have enough money even to...try ordinary cases, which are pending for several months together... in this country unfortunately whenever a citizen comes into contact with government machinery, he is subjected to vexations at every step...An ordinary citizen finds it difficult even to get a ration card. Do you think it will be easy to get a divorce certificate in a court of law for a person who is ignorant and poor? You have not got the machinery to deal with the cases...People manage their own affairs in an automatic manner...You wish to take upon yourself a responsibility for which you are not prepared.[18]

A brief examination of the four acts will illustrate some of the points outlined above. For reasons of space I am only focusing on some of the salient absurdities and drawbacks introduced though much more can be added if one were to examine the changes introduced in detail.

Hindu Marriage Act

The Hindu Marriage Act, by the time it was passed in 1955, had undergone considerable change. Its original provision for civil marriage had been removed and separately passed under the Special Marriage Act, 1954. Its major innovations related to the abolition of the requirement that husband and wife be of the same caste as a necessary precondition for a valid marriage, the enforcement of monogamy, and uniform provisions for dissolution of marriage for all castes.

The first two were more or less generally accepted as desirable in theory if not in practice, by the time the bill came to be passed. The main objection to enforcement of monogamy sprang from resentment at Muslims being allowed polygamy—a point we shall deal with later—although customary law regarding 'karewa' marriages, polyandry, polygamy with a view to having a son in case the first wife was unable to provide one, were also canvassed. The major part of the debate came to revolve around the provisions for dissolution of marriage. The legislators had borrowed lock, stock and barrel the British notions of dissolution which had developed very slowly and hesitatingly through the 19th century in England. In a desire to adhere to the Biblical dictum "What God hath joined together, let not man put asunder", English law had, as it were, constructed a series of steps on the way to complete dissolution, and had also provided for backtracking—hence the provisions for void and voidable marriage, restitution of conjugal rights, judicial separation. Legal language used by British jurisprudence refers to divorce or separation granted by a court as 'relief', which is to be granted only to an "aggrieved" spouse. The logic appears to be that marriage is a punishment from which the "erring" spouse deserves no 'relief'. Hence the establishment of the legal principle that a spouse cannot "take advantage of his/her own wrong" to seek relief and the even more absurd principle that if both parties concurred in wanting a divorce this amounted to "collusion" and the divorce should be refused.

In contrast, the customary Indian practice of dissolution of marriage went through no such stages. *De facto* separation—living separately without formal dissolution—was practised routinely. Some texts also provided for dissolution if a spouse disappeared or was categorised as a 'degenerate'. In the large number of communities where divorce and remarriage were practised, the split was a one-time affair, not requiring the couple to go through formal stages. The negotiations were conducted by the community decision-making body in a relatively flexible manner. Undoubtedly, among certain upper caste communities which condemned women to live under numerous restrictions such as purdah and disinheritance, customary law did not provide women adequate protection against the capriciousness of men and allowed for imbalances such as only men being allowed the right to unilateral divorce and even polygamy. However, in a large number of non-Sanskritised communities, women too enjoyed the right to leave their marriage without incurring any social stigma. For instance, even today in Rajasthan there are several communities among whom a woman can freely walk in and out of marriage with no other restrictions except that the man she has chosen as her next husband must reimburse the prior husband the amount the latter paid as bride price and marriage expenditure. Some systems like the 'marumakkattayam' in Kerala even practised what amounted to divorce on grounds of incompatibility at the instance of either partner. As K Kuttikrishna Menon, government pleader from Madras pointed out:

> The local legislature has passed the Madras Marumakkattayam Act (XXII of 1933) containing provisions regarding marriage and divorce which are far more liberal than those met with in any other part of the civilised world.... Divorce may be effected by a registered instrument of dissolution executed by the parties...or by an order of a civil court on a petition presented by a husband or a wife...the petition need not allege any grounds...the mere desire of either party...is considered sufficient....The complete freedom...has not disturbed the domestic tranquillity of the people in any way...[39]

Such forms of divorce finally, after much debate, were excepted under section 29(2) which reads: "Nothing contained in this act shall be deemed to affect any right recognised by custom or conferred by any special enactment to obtain the dissolution of a Hindu marriage, whether solemnised before or after the commencement of this act." Giving these forms of divorce the right to co-exist with the contrary requirements of the Hindu Marriage and Divorce Act, amounts to declaring that the new law has no teeth at all. It is not surprising, therefore, that barring a small section of the urban educated elite in India, very few people go to court to get their marriages dissolved. Often the women are abandoned by their husbands and thus divorced *de facto* without any formal procedures, or the matter is settled through the mediation of biradari elders.

The norms set up by the Hindu Marriage Act were derived from (a) British law and Victorian notions of the essential indissolubility of marriage, and (b) the hegemonic culture of dominant groups living on the north-western plains of India which was far more repressive than the culture of many other regions and even of lower status communities in this same region.

The Hindu Marriage Act imposed the notion of adversarial divorce and the notion that it should be made as difficult as possible, which were imported from 19th century Britain. The lawmakers failed to draw on indigenous systems of divorce in framing the law. This was partly because of a contempt for indigenous systems, especially those of the south, which was shared by both the supporters and the opponents of the bill. For example, S P Mookerjee of West Bengal, speaking against the bill, expressed typically cavalier disregard of the alternative systems available in the south: "Somebody said...that south India was specially progressive and many of the laws which we are considering are already in existence there today. I say good luck to south India. Let south India proceed from progress to progress, from divorce to divorce...why force it on others who do not want it?"[40]

Several members of parliament pointed out that the framers of the Hindu Marriage Act were mistaken in thinking that British notions and practices were more advanced than Indian ones. To quote S C Misra: "...there are certain people... who think that they have brought forward a very progressive measure...it is certainly not more progressive than what you...see around you...It is just like the foreigners who came to India and said: 'You Hindus are in darkness. We are bringing you out into enlightenment.'"[41]

In an incisive and well-reasoned speech, a supporter of the bill, Jaisoorya of Medak, pointed out:

> The hon minister's ministry evidently did not know where to look for divorce clauses. They possibly thought there is nothing in our ancient system. I say there is Kathyayana Narada and several others... The ministry had to fall back upon...a very very antidiluvian, barbaric divorce law called the Indian Divorce Act...of 1869 made by the ...old Victorian minded Britishers...in Europe the Europeans considered British social laws as extremely reactionary. But, we for generations have been influenced by British jurisprudence...If you cannot find in our ancient laws, by our own thinking, reasonable provisions for divorce, then you might as well copy from other countries...Scandinavia, for instance, is far more advanced than Britain.[42]

He went on to point out that while the act, following British law, lays down that a marriage can be dissolved only if a spouse is not heard of for seven years, Narada and Kautilya had allowed dissolution after three

years of disappearance, and Kautilya had allowed for divorce by mutual consent "whenever there is mutual hatred between husband and wife."[43] He advocated rational divorce provisions which should form the nucleus of a uniform Civil Marriage Act: "Our laws are always lagging behind... All these ancient and archaic ideas of judicial separation, nullity, restitution of conjugal rights...take years."[44]

He also pointed out that "cruelty, endangering life and limb" was an inadequate formulation as it left out of account mental cruelty, humiliation, and even lesser forms of violence like slaps. His and other members' impassioned pleas, however, fell on deaf ears, and the act was passed with not only all the archaic provisions of British law but the inevitable concomitant bag and baggage of British court decisions which are cited even today as precedents. Over the years, some legal changes have been made as, for example, incorporation of divorce by mutual consent and the concept of mental cruelty. Others have been squeezed in by judicial decisions coexisting uneasily with the archaic provisions. For instance, the partner against whom a restitution order has been passed can fail to comply with it, yet sue for divorce on that ground. Other changes that have come about in British law, such as divorce on grounds of irretrievable breakdown of marriage, have not yet been accepted in India, and the adversarial concept of divorce continues to be dominant.

If, on the one hand, some opponents of the bill pleaded against making divorce more expensive and difficult for the poorer classes, some supporters of the bill actually argued that this was a positive feature of the bill, as it would enforce marital virtue on communities given to easy and 'immoral' divorce and remarriage. The tone of contempt and moral opprobrium thus exhibited seems derived from British missionary discourse. To quote a woman member, Kamala Chaudhri:

> .. in 80 per cent of our community I have seen that a panchayat is called and separation is effected within a minute's time...in certain communities even the panchayat does not assemble...Males and females are quite free and leaving each other they can remarry whomsoever they like....the greatest benefit that we would have of this Bill is that our backward communities which have no cultural background will become cultured and their moral standard will be raised.[45]

This bias was not an individual aberration; it is incorporated into the notion of 'customary divorce' that the act, in its final form, allowed as a concession to those communities who insisted on their right to retain their own forms of divorce. A "custom", as defined in the act, must not be "immoral" or "opposed to public policy". Decisions from British times are still treated as precedents. Thus, a caste custom which permits a woman to leave her husband and remarry without his consent was adjudged void for immorality, just as a custom which permits a dissolution of the marriage tie by either spouse on payment of a sum of money fixed by the caste was adjudged void as being opposed to public policy.[46] There is even a ruling that a prenuptial contract between a husband and wife which enables the wife to live separate from her husband if he leaves the wife's natal village, is void because it is against public policy.[47] On the other hand the mere fact of a husband marrying a second wife or mere infidelity on the part of the husband or the fact that the wife is a minor was not considered sufficient ground to disentitle him from claiming the restitution of conjugal rights.[48] Thus, the saving of custom in the matter of divorce merely evaded the problem by passing the buck to individual judicial opinion, thus allowing for law to be made by judges in those instances where the legislature decided to let the custom coexist uneasily with reformed law.

The mindlessness of the tendency to uniformity is to be seen in matters other than divorce in the Hindu Marriage Act. Sushama Sen, a supporter of the bill, replying to a query from a Kerala member, V P Nayar, as to why 'saptapadi' should be considered necessary for a valid marriage when many other forms of marriage were perhaps more widely prevalent (for example, in marumakkattayam marriages, which were contracts not sacraments, the ceremony consisted of a simple exchange of clothes), declared: "I am glad to find that only saptapadi can form a complete marriage. This will be in conformity with the modern progressive society."[49]

How and why saptapadi is more 'modern' and 'progressive' than an exchange of clothing remains unexplained, but the statement is typical of the reformer's style of argument which relied on arbitrarily labelling positive their own measures, and labelling as negative any practice different from the ones with which they were familiar.

The process of creating greater uniformity resulted in annoying a number of communities who expressed the desire to be exempted (Sikhs, coorgs, virashaivas, among others); it also resulted in taking away superior rights that women had in certain communities without seriously affecting the customary practices among those communities which made women live insecure lives. This process had already begun under the British. For example, the Hindu Women's Right to Property Act (HWRPA), 1937, ostensibly passed to enhance women's rights, established the Hindu widow's limited estate in her husband's property (in opposition to the original mitakshara law, as noted earlier). It thereby also took away from Jain widows the absolute interest in property inherited from their husbands, including full power of alienation in respect to such property which they actually enjoyed till then under Jain customary law. Thus the reformed law worked to their detriment.

At the same time it did not destroy or override the customary practices of those communities which allowed widows precarious economic rights. For instance, among jats of Haryana and Punjab, the tradition of karewa form of marriage with a view to keeping the widow from inheriting her husband's share of the property continues unaffected despite HWRPA of 1937 or the Hindu Succession Act of 1956. Under the karewa system the widow is to be accepted as wife by one of the younger brothers of the deceased husband; if this arrangement is not possible, she is to be accepted by the husband's elder brother or his agnatic first cousin. Very often the candidate chosen is a mere child and the widow is expected to bring him up. Equally often, the brother chosen may already have a living wife, thus resulting in a bigamous marriage. In most cases, the widows concerned are unwilling but get coerced because claiming their share from a joint family property is not feasible.

The government does not merely look the other way when the law against bigamy or child marriage is openly flouted but in some cases even facilitates it. For instance, 'war widows' are supposed to receive a large sum as compensation as well as numerous additional benefits such as grant of land, army group insurance benefits, special pension and assistance for each dependent child, apart from the usual pension. The ministry of defence reinforces levirate marriages in places like Haryana and Punjab by the simple device of withdrawing these benefits if the widow remarries outside the family. This amounts to making a mockery of the Hindu Succession Act by supporting a discriminatory custom which lays down that a widow's right to husband's property is conditional rather than absolute as laid down by the reformed law.[50]

A glaring example of such backward movement as a result of the Hindu code was what happened to marumakkattayam women who lost their right, among other things, to adopt any number of daughters, and, most important, their full and inalienable right by birth in inheritance of all forms of parental and ancestral property. A Karunakara Menon, a supporter of the code, was one of those who argued for incorporation of marumakkattayam principles into the uniform Hindu law or, failing that, for exemption of marumakkattayam communities:

> We should not be dragged down from the position that we are in at present...The provisions have been conceived from a patriarchal point of view ..Why should grandson or great grandson be an heir preferred to sister or her children? People in Malabar will never agree.[51]

Unfortunately, people, especially women, of Malabar, do not seem to have voiced their disagreement forcibly enough. This could have been partly because, as M V Vellodi argued, these communities had not "sufficiently realised the implications of the contemplated changes."[52] Originally, the marumakkattayam, 'nambudri' and aliyasanthanam' systems had been exempted from the purview of the Hindu code, but the select committee headed by Ambedkar, against his judgment, removed the exemption. Ambedkar accused the committee of having in its "enthusiasm transgressed...the bounds of reasonableness."[53] But despite this statement, he and the government did not choose to make the issue a centre of debate, but allowed the select committee's decision to prevail.

It was symptomatic of the cavalier attitude of the legislature towards the south in general, and the overwhelming north Indian bias in their approach to the law, that there was no member on the select committee of 1948 who understood marumakkattayam law. This was pointed out by V P Nayar.[54] Some members from the south like Vallatharas of Pudukkotai did express their resentment: "...the northern members have not yet got sufficient appreciation of the south just like the Americans are not able to have sufficient appreciation of India..."[55]

Other communities which did not have vocal representatives in parliament got even shorter shrift. For example, the khasi community, amongst whom the youngest daughter inherits the parental home, was mentioned in passing by a member from Assam, Rohini Kumar Chaudhuri,[56] but no one seriously considered studying their system or incorporating it into the uniform law.

This mindset arose from the fact that parliament was dominated in terms of numbers and political influence by members from the northern plains, who tended to assume that Hindu culture and Indian culture were synonymous with the culture of certain hegemonic castes in their own regions. This assumption, which is dominant even today, had unfortunate effects because the culture of the north-western plains was in many ways the most socially oppressive. These were the regions where the devaluation of women was most severe, manifested not only in such phenomena as institutionalised seclusion through various forms of purdah, but also in exaggerated son preference, low sex ratio, high mortality rates of women and girls, low literacy and employment rates, and, most important, in the context we are discussing, the perception of daughters as an unproductive liability to be got rid of through marriage and sent as far as possible from the natal village. Norms and taboos arising from this culture (for example, that daughters only take from, and never give to, the natal family) were posited as true for all of India, even though in fact they were not prevalent in very many other regions, including most of south India. The most these other regions and communities could hope for was exemption—as tribals or on grounds of custom—and even this was achieved only in a few cases after a long battle. Ambedkar had been basically opposed even to exemption of tribals. Even though most tribals in the northern plains were now a settled peasantry, yet their culture continued to be much less repressive in matters relating to marriage and divorce. But in matters relating to succession and property arrangements, variants of the mitakshara system as interpreted by the British had been imposed on them during land settlement operations, with the result that women had no independent rights in land but only a usufructory right, the equivalent of a Hindu widow's limited estate. This despite the fact that in almost all tribal communities women are the primary workers on land and run the agricultural economy with little help from men.[57]

Changes in Guardianship Act

A justification repeatedly offered for applying the roadroller of uniformity was that this would pave the way for a uniform civil code for all communities, and that passing the law for Hindus would strengthen the hands of government to pass it for other communities too. However, in actual fact, the passing of a supposedly secular law for Hindus (which was in fact a hybrid of some kinds of Hindu law and some kinds of British Christian law) had the opposite effect—a movement further away from a uniform civil law. There were several reasons for this, some of which will be examined towards the end of this paper. But, most blatantly, the legislature, when it codified laws and labelled them 'Hindu', actually thereby replaced earlier laws which had been applicable to all communities, that is, uniform civil laws which had been accepted without protest. A signal example of this process is the Hindu Minority and Guardianship Act, 1956.

The Guardians and Wards Act, 1890, was already in existence, and applied to guardians and wards of all communities. The Hindu Minority and Guardianship Act was passed "in addition to" the Guardians and Wards Act.[58] However, it was not explained why, instead of amending the Guardians and Wards Act, wherever necessary, a separate law had now to be passed for Hindus. There was nothing particularly 'Hindu' about the provisions of the Hindu Minority and Guardianship Act. In fact, the provisions were conceived from an authoritarian statist point of view, giving government powers to interfere with parents in a way unknown to the Hindu or any other Indian community. If any law was to pave the way for a uniform civil code, it would be something like the Guardians and Wards Act, and certainly not a separate act applied to Hindus and arbitrarily labelled 'Hindu' as if it was based on religious principles. As Thakur Das Bhargava argued:

> ...this is an absolutely unnecessary bill and it also goes against the principle of having a common civil code... this is a mischievous bill insofar as the provisions of the Guardians and Wards Act will not apply uniformly to all the nationals... Now a Hindu minor will be quite different from a Muslim minor and a Christian minor...it creates more distinctions than are there in the present law.[59]

In the prevalent practice, in all communities, a *de facto* guardian of a minor was recognised as such. This continued to hold good for other communities under the Guardians and Wards Act. However, the Hindu Minority and Guardianship Act introduced the artificial concept of a "natural guardian" which would also appear to be imported from England: "As in this country [England] so among the Hindus the father is the natural guardian of his children..."[60]

In the absence or unfitness of the father, the mother would be the natural guardian but no other person could be so termed. This narrow concept of natural affection clearly derives from a western social set-up and nuclear family. A member pointed out:

> Under the Hindu law, there is nothing like a natural guardian... As a matter of fact, you have taken away the naturalness of the guardianship. Every person is a good guardian to a minor under the Hindu law...Every *de facto* guardian is a good guardian.
>
> You have thought that India has developed to that extent that there is no relationship except that of the father and the mother. But there is also the grandfather, the maternal uncle...and...many others... who bring up the child after the father and mother are dead...[61]

What is here described is a family and community set-up in a culture shared by Hindus and non-Hindus, which may be termed an Indian culture. The legislature created an unnecessary sense of grievance by passing the Hindu Minority and Guardianship Act which, in any case, was unworkable. The act lays down that a person will be recognised as guardian only if appointed by a father or mother in their will, or if appointed by a court. The writing of a will is alien to Hindu law, so the provision has nothing 'Hindu' about it. It should have remained part of the Guardians and Wards

Act. However, it is also irrelevant to Indian conditions: a member had pointed out: "...in a country in which nearly 80 per cent of the people do not know what a will is, and many people are illiterate, do you want to say that in every case in which the father and the mother are not there, the minor's cases must go to court and get a guardian appointed?"[62]

The Hindu Minority and Guardianship Act also does not allow a guardian, even a parent, to alienate any part of a minor's property without the permission of the court, a patently unworkable proposition. The positive aspects of the act were that it gave the mother (in the father's absence) the right to appoint a guardian by will, and it took away the father's right to make a will depriving the mother of her guardianship right, after his death. However, it certainly was far from giving women equal rights. Several members proposed that custody of the child should be with the mother not just up to age five as the act lays down, but up to ages 12 to 14. Amendments to this effect were moved and summarily refused by law minister Pataskar as "besides the point" and likely to "lead to interminable quarrels between the parents."[61]

An example of how this new legislation created religious bias in law is the provision (opposed by several supporters of the bill) that a parent ceases to be a natural guardian if he or she converts to another religion. No such provision existed in Hindu law and, in the terms of the bill itself, the word 'natural' would suggest that guardianship was based on biological parenthood and not on the parent's religion. Significantly, this was the only provision approved of by the Hindu Mahasabha MPs who were otherwise opposed to the bill. It was described by government as part of the process of consolidating Hindus as Hindus. In the words of Ambedkar:

> The first change is that the power of the Hindu father as natural guardian of his minor son has been taken away if he renounces the world or ceases to be a Hindu. The original law was that the father was the natural guardian and no matter what change took place in his condition either by his religion or in any other way, he still continued to be the guardian of his minor son. The committee felt that as this was a code intended to consolidate the Hindu society and their laws, it was desirable to impose this condition, namely, that the father shall continue to be the natural guardian so long as he continues to be a Hindu."[64]

The Hindu Adoption and Maintenance Act, 1956, is also the product of the same kind of hybridising effort—a weird mixture of British adoption law with one kind of Hindu adoption, 'dattaka', with the result that the act retains such irrational anomalies as not allowing a person to adopt a son if he already has a natural or adopted son, not allowing adoption of a daughter if there is already a natural or adopted daughter, and thus restricting the number of adoptions possible by any one person to a maximum of two—one boy, one girl.

The main innovation the government claimed to be making was permitting a daughter to be adopted. However, by the law minister's own account, it was an English judge, relying on a doubtful translation by an Englishman (Colebrooke) of *Dattaka Chandrika*, who had ruled that adoption of girls was invalid. Prior to this, several courts had recognised the customary adoption of girls. In Bombay and Calcutta judges had ruled that adoption of a daughter by a dancing girl was invalid, because the judges regarded the custom of professional dancing as immoral. Two Madras decisions had, however, upheld such adoption, even simultaneous adoption of two girls, provided the adoption was not made for the purpose of prostituting the girls. Some of the leading schools of Hindu law laid no restrictions on adoption of daughters. Nanda Pandit in his *Dattaka Mimansa* has favoured adoption of a daughter and regards it as conducive to spiritual benefit to the adopter and his ancestors. In actual fact, among most communities, girls were routinely adopted under customary law. Often it was only a legal fiction. For instance, if the forbidden 'sagotra' marriage was to be made legal, a relative or friend of another 'gotra' would adopt the girl, thereby technically changing her gotra. Likewise in many parts of India, custom allowed women to adopt on their own. However, the reformed adoption law does not allow a married woman to adopt in her own right, or even jointly with her husband. Only the man can adopt, albeit with his wife's consent. When it was pointed out that this falls short of equality, the law minister Pataskar claimed that such equality would be going too far:

> I do not think there can be one adoption by the husband and another adoption by the wife. ...That is simply trying to subject this legislation to ridicule. The wife is not given the right. It is true .... I do not want to go, nor will it be desirable in the interest of the society to go so far. I want that it is primarily the husband's business to adopt...[65]

In making this statement, Pataskar overlooked the fact that under 'krithima' form of adoption, prevalent in and around Mithila, a wife or widow could adopt a son to herself, without the consent of her husband or anyone else.[66] Krithrima adoption was recognised as legally valid though no ceremonies or documents were required for it. Tek Chand pointed out: "Krithrima adoption of the strict Hindu law is a secular type of adoption whereas the 'datta homam' adoption of Hindu law is a sacerdotal form of adoption."[67]

Paradoxically, the Hindu Adoption and Maintenance Act recognises only datta homam or dattaka type of adoption. Without stating any reason, other customary forms of adoption such as krithrima and 'illatom' (adoption of son-in-law, prevalent in some parts of south India), and 'dwayaya-mushayan' (simultaneous adoption of one or more sons) were rendered invalid. These were not extinct textbook rules but were living practices when the law was sought to be codified. For instance, my colleague Giri Deshingkar recalls that his wife's uncle, who came from a village in north Karnataka, was adopted by his own mother-in-law, who was a widow. That made the husband and wife brother and sister, but it was considered a perfectly legitimate adoption. Ambedkar has offered an absurd explanation for legislating such adoptions to be invalid:

> ...all these customary adoptions are nothing but devices to keep property within the two families which enter into this bargain, and ... since we have passed the constitution and included in the Directive Principles one article saying that the state should take steps not to allow property being concentrated in the hands of one or a few, such devices...ought not to be tolerated.[68]

It should be noted that with the ruling out of customary adoption, property was likely to pass, for want of an heir, into the government exchequer. From such cavalier justification of state interference, his conclusion naturally followed: "Besides, there is no reason why parties who want to make a genuine adoption should not conform to the rules and regulations regarding the dattaka adoption which is permitted by the law."[69]

The dattaka form of adoption required a ceremony of giving by the natural parents or guardians of the child and taking by the adoptive parents. This meant that an orphan or foundling could not be adopted unless he or she had a legal guardian (as defined under the Hindu Minority and Guardianship Act) to perform the giving ceremony. It also meant that *de facto* adoption was not recognised. Even if a child was known to have been brought up from infancy by adoptive parents, the adoption could be challenged in court and held invalid if it was proved that a giving and taking ceremony had not taken place or that the person who gave the child was not a guardian legally entitled to do so. Dattaka adoptions led to endless litigation, as was pointed out by many MPs, and not refuted by government. Government, however, because of its anxiety to label the act 'Hindu', preferred to retain the give and take ceremony as a sign of 'Hinduness' rather than to follow other forms of customary adoption practised by Hindus which did not involve a religious ceremony.

Thakur Das Bhargava once again pointed out that all communities in India had been influenced by one another's laws and evolved similar customs in regions where

they lived in proximity to each other and that the Hindu Adoptions and Maintenance Act, like the Hindu Minority and Guardianship Act, was an unnecessary step in the opposite direction:

> Today, in the Punjab, Hindus, Muslims and Christians, all follow the law of appointment of heir....We are again making the mistake of making an exclusive law for Hindus. ..You should have waited a while longer and then made one law for all....You have taken some things from the Hindu religion and left out the rest. It would have been better if you had just said anyone can adopt anyone they like.[70]

To this, law minister Pataskar replied that the customary practice of appointment of an heir in Punjab was technically different from adoption as under the Hindu Adoption and Maintenance Act, hence the former would not be abrogated by the latter. However, he did not answer the salient question of the inconsistency within the act itself. Most of the inconsistencies arose from the framers' uncertainty as to whether the purpose of adoption was to have an heir or to bring up a child. So, for example, a man is not permitted to adopt a son if he has a living son or son's son or son's son's son. This apparently has to do with the desire to prevent disinheritance of biological male heirs in the male line. Dabhi argued that this defeated the idea of women's equality, as it allowed a man to disinherit his daughter or granddaughter in favour of an adopted son. He moved an amendment supported by Thakur Das Bhargava, an opponent of the bill, and Sushama Sen, a supporter of the bill, which Pataskar negatived. Another such inconsistency was allowing the adoptive parent to disinherit the adopted child by will. As Raghavachari of Penukonda pointed out, once such disinheritance was allowed, why restrict the number of children that can be adopted?

All the objections, both from supporters and opponents, could be summed up in N C Chatterjee's justifiable statement that: "....the hon minister has not the courage of his convictions. If he wants to secularise it, let him do it properly."[71]

New Maintenance Act

The maintenance provisions under this act are deplorably inadequate. The established right under Hindu law of a concubine to maintenance was arbitrarily eliminated on the pretext of its being an encouragement to immorality. The code of Yajnavalkya, on which the mitakshara system is based, had laid down that the maintenance granted should amount to one-third of the husband's income. But under the reformed law the amount of maintenance granted to a wife is left to the individual judge's discretion, though it cannot exceed one-third of the total income. Thus while the law lays down an upper limit, there is no mention of the minimum amount that must be her due. It is not at all clear what either of these alterations had to do with 'Hindu' law or with furthering women's equality. In fact, both move in the opposite directions.

Theoretically, the reformed Hindu maintenance law allows a woman to claim a maximum of one-third of the joint incomes of her husband and herself. That means that if, for example, she is earning Rs 500 and her husband Rs 1,000, she cannot claim anything because she already has one-third of the joint income which is Rs 1,500. But even for those women who are not earning, in practice it is extremely difficult to claim and get their right under Hindu law. The case is a civil one which means that the husband can employ all sorts of dilatory tactics to drag the case out for years. One of the biggest hurdles in the way of getting a fair maintenance is that the burden of establishing the husband's income and assets falls on the abandoned or divorced wife. Given that in India an overwhelming majority of people either work on land or own businesses in joint families or are self-employed, their real earnings are usually not part of any official record. That makes it almost impossible for a woman to prove her husband's income to the court's satisfaction. A woman may end up spending much more on court expenses than the pittance she is likely to get by way of maintenance through the court. Moreover, there is no way of ensuring that the husband will make regular payments. If he were to stop after paying alimony determined by the court for a couple of months, a separated or divorced wife has no redress mechanism available but to go to court again. She cannot, for instance, approach the police to demand that they ensure that the court order is complied with.

The near total failure of Hindu maintenance laws becomes evident if we consider the fact that most women prefer to plead under Section 125 of the Criminal Procedure Code which is not really the relevant procedure for maintenance of a divorced wife. Getting a maintenance allowance from the husband has been defined as the right of a divorced woman in reformed Hindu law whereas 125 CrPC exists to safeguard all destitute women, children and old parents. For instance, even a destitute father could claim maintenance from his children under this provision. Yet most divorced women have to sue for maintenance under this clause because it is a criminal case and they can get relief somewhat more quickly. However, under this provision, they can get a maximum of only Rs 500 per month which is much less than the statutory minimum wage in India and often ridiculously inadequate in relation to the amount many of them would be entitled to as maintenance after divorce. Also, the sum of Rs 500 is a fixed one and bears no relation to the income of the husband. Even if he is earning lakhs, she can claim a maximum of only Rs 500. Under the Hindu maintenance law, she may be able to claim more, but the procedures under the civil law are so cumbersome that it is hardly worth fighting for under those clauses.

Hindu Succession Act

The Hindu Succession Act, 1956, was by far the most controversial part of the four acts. It was also perceived as the key part of the code, as no other rights could be effectively claimed by women unless they had economic rights. Raghuramaiah pointed this out forcefully:

> ...divorce will not be really effective unless there is... an equal right of property...a woman who has no independent source of living would naturally be very chary about taking recourse to these divorce provisions...this bill will be of no consequence, and of no benefit to the women of India unless they are given an equal right to property...[72]

But did the Hindu Succession Act actually give women 'an equal right to property' or did it only profess to do so? The original provisions on succession in the Hindu code, framed by the B N Rau committee and piloted by Ambedkar, abolished the Mitakshara coparcenary with its concept of survivorship and the son's right by birth in joint family property, instead substituting the principle of inheritance by succession. These proposals met with a storm of opposition. The extent of opposition within the Congress itself can be gauged from the fact that in 1954, then law minister Biswas, on the floor of the house, expressed himself as not in favour of daughters inheriting property from their natal families. As supporters of the bill pointed out on several occasions, the reason for the virulence of the opposition to this provision was that it affected each individual male personally as he would have to share property with his sisters. Sita Ram Jajjoo, marwari from Madhya Bharat, identified the reason for resistance accurately: "Here we feel the pinch because it touches our pockets. We male members of this house are in a huge majority. I do not wish that the tyranny of the majority may be imposed on the minority, the female members of this house."[73]

However, the tyranny of the majority was in fact imposed, and by the time the bill was finally passed in 1956, it was unrecognisable. The major changes were: (1) Retention of the mitakshara coparcenary with only males as coparceners.

(2) Coparcener's right to will away his interest in the joint family property. This provision was unexpectedly introduced by an amendment by law minister Pataskar in the final stages of the clause-by-clause debate when the bill was to be passed, in 1956. It was widely perceived and pro-claimed, even in the contemporary press, to be a capitulation by government to what were by one MP termed the "fifth column" of the Hindu Mahasabha within the ranks of the Congress.
(3) Removal of exemption of marumakkattayam and aliyasanthanam communities; that is, virtual destruction of the only systems in which women were the equivalent of full coparceners.
(4) Alteration of the original provision that a daughter would get a share equivalent to half the share of a son in self-acquired property of the father who died intestate.

Ambedkar saw this alteration as a *fait accompli* in spite of him: "My enemies combined with my enthusiastic supporters and my enemies thought that they might damn the bill by making it appear worse than it was."[74]

Let us look at the implications of each of these provisions. The retention of the mitakshara coparcenary meant retaining, without codifying, a large part of earlier Hindu law which discriminated against women. One way out of this would have been to also make women coparceners. This was suggested as early as 1945. In the written statements submitted to the Hindu law committee, a number of individuals and groups, including nine women students' and youth and ryots' organisations (significantly, all from Andhra Pradesh—the first state to actually amend the Hindu Succession Act in 1984 to make women coparceners) had advocated a full share and a right to partition for daughters. G Krishnamurthi, subordinate judge, Chicacole, Andhra Pradesh, had suggested that daughters be made coparceners. In 1956, when the bill was being finally debated prior to enactment, K C Sharma moved an amendment that the daughter and her children should be deemed to be members of the Hindu coparcenary in the same way as a son or his children. This would have been the logical step to take since the framers of the bill claimed to be trying to incorporate al: the most progressive elements of the different schools of Hindu law, and such a system was actually in existence in Kerala. However, law minister Pataskar's reply, instead of attempting logic, merely amounted to an emotional rejection:

> I really find that my friend Pandit K C Sharma is very progressive in his outlook. ...I cannot imagine of a family which can go on smoothly by the addition of daughters, their heirs and so on...It is admitted that a daughter does go out of the family by marriage.[75]

This assumption that daughters must go out of the family on marriage and, thereby, cease to be full members of their natal family was at the root of all the inequities built into the Hindu Succession Act. One such inequity was the clause enabling state governments to pass laws to prevent fragmentation of land. Those who had acrimoniously argued for explicit exemption of agricultural land from inheritance by daughters demanded that the minister make an explicit statement that the new clause would amount in reality to the same thing as exemption. Bhagwat Jha Azad had asked:

> Is it your understanding that after this law is passed, states in which there is no such prior law can pass such laws, disregarding this law, and can make provisions that landed property shall not be given to daughters...If your interpretation is that under this law daughters will not be able to demand their share in land then I have no objection.[76]

The minister's silence to this question would seem to have amounted to consent.

The second disparity was the list of heirs being different for a male and a female, with a woman's in-laws taking precedence over her parents, while a man's in-laws figure nowhere at all in his list of heirs. The idea of a woman's property and the heirs to it being somehow intrinsically different from a man's derives from the 'stridhan' system, but in-laws did not precede parents as stridhan heirs. The bias in favour of in-laws is thus introduced here purely on the basis of the contemporary north Indian practice, repeated *ad nauseam* by certain members, that a woman's parents would not even drink water in her village, let alone agree to inherit her property. Despite being repeatedly told that there were no such taboos in south India, the north Indian members persisted in identifying the northern custom with 'Hindu' and 'Indian' tradition and ideals. They dismissed the southern practice of normal interaction with daughters as an "aberrant" custom or usage. The exchanges were often almost comical, except that the results of such wilful arrogance were tragic.

When, for example, Mukut Behari Lal Bhargava was arguing that no Hindu parent would want to inherit a daughter's property, L Krishnaswami Bharathi asked:

"Why not? Why not? What is the harm?
Bhargava: Perhaps my honourable friend comes not from India but from an outside country.
Bharathi: I come from south of India.
Bhargava: In India no father nor mother will ever think of receiving anything from the daughter.
Bharathi: That may be so in the Punjab.
Bhargava: It is so in the whole of northern India. I cannot speak with authority about south India...in our part of the country the father or mother will not even take water in the house of the daughter.
Bharathi: It is not so bad in our part of the country.
Bhargava: That may be a custom or usage prevalent in your part of the country, but in my part of the country, an overwhelming majority will be opposed to the idea... Therefore the entire fabric of the rules of devolution is based on anti-Hindu ideals."[77]

Interestingly, while a north Indian custom is here passed off as a Hindu ideal, no one quoted the numerous shastras which give precedence to parents of a woman as heirs to stridhan, as a much more well-founded Hindu ideal! Instead, as a concession, the order of heirs was altered only for members of formerly marumakkattayam and aliyasanthanam communities, but the rest of the south was brought under the new inheritance system where a woman's in-laws take precedence over her parents. This was the logical outcome of the provisions in the Hindu Succession Act which facilitated disinheritance of daughters. The property of daughters could not be passed on to surviving parents when the new law accepted the assumption that a daughter should not get inheritance rights in her parent's property.

Yet another inequity were the provisions denying a married daughter the right to residence in her parental home unless widowed or deserted and denying any daughter the right to demand her share in the house if occupied by male family members. There were long debates on whether a widow should have the right to residence if her husband had also left behind a house, and whether only a deserted wife should have the right to residence in the parental house or also one who had left her husband. The law minister's remarks on the last issue are revealing:

> I think those women who desert their husbands are not likely to be needy women for whom provision has to be made. ...I do not know whether we should provide for a woman who deserts her husband, because she might desert him for the purpose of marrying another, or she has other means of maintaining herself.[78]

No one mentioned denying the right of residence to a son who deserted his wife. Clearly, the operative assumption is that the right to residence is not really a 'right' the daughter should have as the son does but only a charitable concession to be made for a needy daughter. After much debate, the right was also granted to a woman who has separated from her husband.

Similar arguments based on the daughter being or not being needy were used by the law minister to justify allowing the father to will away his interest in the coparcenery property—a proposal which was one of the

most hotly disputed of all. Pataskar argued that one daughter may be well-married or single with a good job while another is poor and in need, so the father should be able to decide who needs property more. Such an argument would apply equally well to sons but was not used to deny them their right by birth in the coparcenary. The imagined distinctions between daughters derive from such distinctions made by certain schools of Hindu law where, for example, a daughter with a son was preferred to a sonless daughter, or a single daughter was preferred to a married daughter for inheritance purposes. It was the stated purpose of the Hindu Succession Act to do away with all such distinctions and place daughters on an equal footing with sons. Yet, the distinctions persisted.

From the very start of the codification process, many of those engaged in the debate had pointed out that the newly introduced provision of the will could be used as an instrument to deny daughters their rights. Some welcomed this and proposed that it be made easier; others warned of its dangers. For example, in the written statements submitted to the B N Rau committee, we have one high court judge of Madras complacently (and as it happened, accurately) foretelling how the law would remain a dead letter:

> ...it is possible for the Hindu citizen who does not agree with the proposals to get over them. He could make a will and avoid those rules of inheritance by women which may not be to his liking...I, therefore, do not think they are likely to have any serious consequences in general.[79]

In one of the written statements submitted to the Hindu law committee, a graduate from Moga went further to say: "Easy and unquestionable form of will in favour of the sons and against daughters should be suggested."[80] Several persons had suggested some check on the testamentary power in order to protect the maintenance right of women, and their inheritance rights. A written statement to the Hindu law committee pointed out: "The right of alienating property by 'will' ...is one not conferred or recognised by ancient law, or by the existing Hindu law. The idea of 'will' itself is foreign and a later importation...There must be a preliminary part dealing fully with testamentary succession and limiting the rights of a testator..."[81]

It was suggested that a man be permitted to will away only half of his property on the analogy of Muslim law which allows only one-third to be willed away. The bar association of Rawalpindi, however, pointed out that such a curb in itself would not work because he might "gift away the property to his sons" in his life-time.[82] These arguments were repeated and elaborated over the years in parliament, so it cannot be contended that the government was unaware of the implications of conferring the testamentary right with regard to ancestral property—a right absolutely unknown to Hindu law.

That the real pressure groups behind the change in property laws were not women's rights advocates but industrialists who saw economic advantage in rendering property more mobile in the hands of individual male owners is suggested by some very revealing articles in the contemporary issues of *The Eastern Economist*, over the years 1949 to 1955. This was the journal of the Federation of Indian Chambers of Commerce and Industry (FICCI), and thus may be said to represent the view of an important section of big business interests. The position taken by the journal in its editorials was that the most important benefit of the bill, although it was perhaps the least noticed aspect, was not women's rights at all, but rendering property more liquid by allowing men to alienate it. The journal was not in favour of women's inheritance rights. More than once it pointed out that the testamentary right could be used to set at nought women's rights. In the issue of March 18, 1949, the lead article 'The Economics of the Hindu Code' remarked:

> It is curious how little of the discussion centred around basic economic factors. There is indeed a feeling among a few that economics played no little part behind the scenes...the Hindu code minimises those factors which attach to an individual by virtue of his birth and enables him to shape his destinies by free contractual relations...the daughter will get a share equal to that of the son... the principle of equal shares to daughters...it is said, not unreasonably, would aggravate the evil of fragmentation of agricultural holdings...But this...can for the most part be avoided by wise use of the testamentary power and neither an urban family business nor a family agricultural holding need be prejudiced...In the ultimate analysis, the true hallmark of a sound property system would lie in its mobility, in the reduction of the hindrances to freedom of transfer...

While rationalist social reformers pride themselves on their conquest of the conservative opposition and women are elated by their hardwon rights, the economist may perhaps find some merit in the system of ownership of, and succession to, property which the code contains. *What has least been noticed may possibly prove to be of the largest economic worth*"[83] (emphasis mine).

Six years later, the argument had shifted, and the journal actually took the stand that while the mitakshara family system should be replaced by the dayabhaga, daughters should not be given inheritance rights immediately but that these could be left to be introduced gradually by the "more progressive states".[84] The testamentary right, then, was essentially a right given to fathers to obviate the rights of daughters.

In the final debate in 1956, this became a central issue. It was pointed out that a man could disinherit not only daughters but even traditional female heirs such as a widowed daughter-in-law. Earlier, these female heirs had a limited estate but this was ensured to them; now the so-called absolute estate would depend on the man's will. It was argued by many members that the clause meant undercutting the whole bill whose ostensible purpose was to provide equal inheritance rights to women. The provision that allowed daughters to sign away their rights in favour of their brother or others even in the insignificantly small share that would come to them in coparcenery property, made a mockery of the whole exercise. S S More expressed his disappointment:

> Are you giving anything substantial to the daughters? ...I will say: "No". ...Those who are opposed to this bill, those who want to see that their daughters should not get their dues should do nothing else but ...prepare standard will forms and give them for signature by everybody who has some property...this particular clause is very sinister. It takes away by the right hand what we are trying to give to the daughters by our left. ...this sort of keeping a loophole in the whole measure is not a good practice. Let us be honest. If we do not want to give to the daughters anyhting, then surely, let us say that... in view of the fact that the elections are in the offing, we are not prepared to go whole length.[85]

On the other hand, some members rejoiced openly in the inclusion of the clause. Raghuvir Sahay said it openly: "By giving this right, the greatest bitterness of the bill is removed. To take the sting out of the tail....When you give a Hindu the right to make a will I think all the faults of the bill are dispelled."[86] He added that he initially was opposed to the bill but gradually changed his stand, because it represented a middling position between two extremes. The inclusion of the right to will away coparcenary interest clearly played a part in inducing him to change his stand.

One ferocious opponent of the bill, B D Pande of Almora, who claimed that Hindu religion was founded on women's piety and generosity in refusing to take property and break the family, and that men and women were created unequal by god, announced on the floor of the house that he had already made his will and that his daughters had given in writing that they would not claim a share in his property. Thus it was clear even at that point that the right to make a will being introduced in the Hindu Succession Act would be used primarily to snatch away a daughter's rights. Several members wanted to put some sort of a restriction as exists in Muslim personal law on the right to a will in order to ensure a minimum measure of protection for women members of the family.

For instance, Kelappan moved an amendment that a Hindu should not be able to dispose of more than one-third of his property by will, and Jayashri moved that a Hindu not be able to leave by will more than half his property to anyone but his wife or children. The law minister refused to accept these amendments.

Thakur Das Bhargava proposed an amendment along the lines of English law, that if a man disinherited by will his widow, minor sons or unmarried daughters, they could have a claim to maintenance on his property. This amendment was supported by Renu Chakravarty and other ardent supporters of the bill, but Pataskar negatived it, saying the right to maintenance would be protected under the Hindu Adoption and Maintenance Act. That was a hoax. The provisions under the new maintenance law were even more inadequate than the deliberately incorporated loopholes in the succession act. Given the clarity with which all the movers of amendments argued their cases, pointing out that the will could be used to deprive women of even the limited rights they had under uncodified law, it can only be concluded that government deliberately chose to create this loophole. Kelappan argued:

> I cannot understand how this government can afford to be indifferent to a glaring injustice which this clause 32 seeks to perpetuate... In the interests of justice and the well-being of society, some restrictions have to be imposed on a person's right to will away his property, even if it is self-acquired.[87]

Even the contemporary press saw the amendment introduced by the law minister as "a concession to orthodox opinion"[88] and commented: "Much as they protested to the contrary, the retentionists of the traditional pattern of Hindu society had little reason to be disappointed with the outcome of their stout opposition to the bill, which has led to its toning down."[89]

The introduction of the right to will away one's interest in coparcenary property in effect meant giving men much more power over property than they had under traditional mitakshara law, not to talk of other schools which were more favourably inclined to women. Even under the mitakshara law the coparcenary system restricted the rights of individual men to alienate property, thereby safeguarding the rights of all members of the family including even infants and children in the womb, and also the rights (though unequal) of women and illegitimate children to maintenance from the joint family property. Although many powers were vested in the karta or male head of the family, who was supposed to administer the property in the interests of all members, decisions regarding disposal of family property were to be taken collectively. Although notionally each male had an equal share in the property, expenditure was not to be apportioned only to males but also to females. Expenditure on women members' needs, gifts and endowments for pious and charitable purposes, or on the special needs of some members, was to be undertaken from the common funds, and no coparcener was entitled to complain that more had been spent on another member than on himself. Some mitakshara schools even allowed a wife to act as a karta in her husband's absence.

The right to will is completely alien to Hindu law. Its introduction into a law labelled 'Hindu' was thus a singular irony. Pataskar, while defending the new clause, first attempted to give a sentimental tone to the debate:

> There are many hon members in this house who feel that if once this right to will is given coupled with the right to partition which the son enjoys, it may defeat the purpose of this legislation. But as I have been always saying, I have got at least better faith in human nature, and I think the father...will have equal regard for the son and the daughter... After all, it is much better to leave it to the judgment of the father and I think he is bound to exercise it in a fair and equitable way. Whom else, excepting the father, can you trust to achieve this purpose?[90]

Yet, this touching faith in the egalitarian propensities of fathers did not prevent him from clearly pointing out in the very same speech that the purpose of the new clause was to give these fathers the right to decide who should get property, a right they did not have earlier; and thereby also the right to disinherit the daughter completely. He argued that a man "...can under the new provision contained in clause 32 of this bill make a will in respect of his interest in the joint family property, and provide that she [the daughter] shall have no share in his interest. ...It is thus clear that those who want to be governed only by the existing rules of the mitakshara system even after the passing of this act have been given the choice to do so."[91]

One would have to look far to find another law minister who was willing to point out so blatantly in a parliamentary debate how a government-sponsored bill contains within itself the means for its own circumvention! The provision of the will has indeed become a standard method for disinheriting daughters. Apart from the father's will, it is a fairly common practice that fathers and brothers make the woman sign a will on the eve of her marriage that she forfeits her share of property in favour of her brothers.

If, indeed, the purpose was to give people a 'choice' to be governed either by the new act or by their earlier systems of law, then why was that choice denied in matters of succession to followers of the marumakkattayam, aliyasanthana and nambudari systems? The act decreed that at each death in such a family a partition would be deemed to have taken place, and the property devolve by succession, not survivorship. The right of birth in these systems was thus done away with. The original Hindu code had provided similarly as regards the mitakshara system as well, but following protests, had decided to safeguard its existence and continuation. The lack of sufficient protest from matrilineal communities allowed for the decimation of the matrilineal systems and the further spread and strengthening of the discriminatory aspects of mitakshara law.

A genuine 'choice' could have been more validly given to people by passing a uniform civil law with rational and genuinely egalitarian provisions, and allowing people to voluntarily opt for it. This proposal had also been repeatedly made over the years by many people, but had been studiously ignored by government. When written statements were collected in 1945, a number of respondents had suggested that the code be made optional, and had argued that this would be in keeping with the spirit of Hindu law which allowed for new schools of thought and law to take root and flourish. T G Aravamudan, advocate, Madras High Court had put forth the advantage of such an approach:

> Hindu law... is a complex of varying schools... There has been also room in Hindu society for a wide range of thoughts...and practices... from polyandry to polygamy, and from dayabhaga to aliyasanthana. A new school of Hindu law—albeit by way of a code enacted by a legislature—may not therefore be prevented from materialising... No Hindu group ever sought to force its pattern of thought and practice on another... The draft Hindu code should therefore be...a 'school' of Hindu law which one may adopt if one so desires, but which one may not impose on any other.[92]

It was argued that this would be more democratic and would place upon proponents of the code the responsibility of informing people of its provisions. V Narayanan, an advocate from Madras, had suggested: "...let the progressives...induce large sections of the community to disown their present laws...and...gradually elbow out the diversities of thought and conduct... characteristic of present-day Hinduism."[93]

The proposal to make the code optional was not a utopian one. Such measures as the Special Marriage Act already existed as examples of options available to citizens of all communities. If the government was genuinely desirous of setting up norms of equality and gender justice, it would have done better to frame a thoroughgoing egalitarian civil code rather than undertaking the shoddy piecemeal alteration of Hindu law in the name of reform. Such a civil code could then have been made available to any citizen who opted to be governed

by it. The government seems never to have seriously considered this proposal, and by the 1950s it had more or less ceased even to be proposed. When Ambedkar challenged the notion in 1951, no MP was able to offer an answer:

> Are women to have the right to make an option or not?... If the husband makes an option under this law, will it apply to his wife...? If the husband does not apply it to himself, will the wife be free to do so?... It would be utter confusion. ...Our law may be deformed in some way, but it should not altogether be unaesthetic: It must be good to look at.[94]

The sudden leap here from practicality to aesthetics suggests the basic nonseriousness with which the proposal was treated. In any case, the reformed Hindu law is hardly aesthetic given the dishonesty with which it was framed to defeat the very purpose for which it was initiated, viz, providing equal rights for women.

Away from a Common Civil Code

The idea of an optional code does indeed raise serious problems, such as who would be allowed this option: the family or a unit or each individual in the family? One possible way out was to allow women special rights to seek redress under the optional, egalitarian, civil law in case they felt dissatisfied with the deal offered to them under their respective customary laws. This step of positive discrimination would be in tune with the professed aim of the new legislation—that is, eliminating the discriminations against women incorporated in diverse customary laws. It would, in effect, amount to giving women in every family and community the veto power in deciding whether a family was to continue being governed by its customary law or move towards an egalitarian civil code. Thus a community would have to evolve their customary practices to be more in tune with the concept of gender equality, in order to continue commanding voluntary allegiance, rather than be able to force obedience.

In the first few years of Indian independence, the atmosphere was relatively more propitious than it is today for the acceptance of an optional civil code by certain sections of all communities, including Muslims. Had such an optional civil code been attractive enough in terms of benefiting those who opted for it and had the government set up a machinery to make the code easily implementable, more people would gradually have gravitated towards it. Those women who felt wronged by the inequities of their community's personal law would have been able to opt for the code, thereby building pressure for reform from within. In such a situation, no community would have occasion to feel that it was being singled out for forced reform of its laws or that other communities were being pampered by being spared such alteration.

The route followed by the government of forcing an altered uniform law on Hindus alone bred resentment and developed a persecution complex among the educated Hindus, which was based on an understandable logic. Questions such as the one raised by V G Deshpande were never answered:

> When I try to understand the meaning of the Hindu code bill, has it anything to do with the name 'Hindu'? Does it signify that it is based on Hindu traditions, Hindu ideas, personal law and values...Government is going to introduce certain mischievous principles which it dare not apply to the Muslims, Christians, Parsis or Jews.... The Hindu code bill is a big conspiracy to encroach upon the personal laws of the Hindus.... The Hindus are...the objects of special favour from our great Congress government! When we come to oppose it, we are called communalists and reactionaries... and those who support it are the secularists, non-communalists and the nationalistic legislators...why this personal law of the Hindus alone is being interfered with in this secular state?[95]

The logic is hard to fault. To pass a law labelled 'Hindu' seems hardly a secular move. Nor were the real motivations of the bill's proponents as genuinely secular as they claimed. They repeatedly spoke of the need to unify and consolidate the Hindu community. And in this aim, they found an ally in the Hindu mahasabha. In an unexpected speech congratulating the minister on passing the Hindu Succession Act, N C Chatterjee of the Hindu mahasabha, who had been opposing the legislation all along, laid his finger on what he saw as its achievements—unifying Hindus, and making property liquid in the hands of men, that is, giving them more arbitrary powers over family property:

> I ought to confess frankly that when I was a student of Hindu law...I was amazed at the wonderful diversity of the law, between the 'mayukha' and the dayabhaga, between the Mithila and the Dravidian school. There was almost a feeling of revulsion. I believe in Akhand Hindustan and.. I wanted to have...one uniform Hindu law...Sir B N Rau advocated the introduction of dayabhaga and complete elimination of coparcenary system. I was very happy...if you really want to develop trade and commerce, if you really want to build up a new India, if you really want to develop your industries and your business in the private sector, you cannot do it under the antiquated system of law.[96]

There is little love shown here for a key characteristic of Hindu culture, namely, its diversity. It is contemptuously dismissed as an 'antiquated system of law'. Instead, there is a vision of a new capitalist India in which men control trade and commerce, and of an 'Akhand Hindustan' in which only one kind of Hindu exists, a kind not 'repulsive' to the ideologues of the Hindu mahasabha wishing to reshape Hindu society to resemble the dominant west. The supporters of the bill often used similar logic, arguing against that diversity which was the strength of Hindu culture. In one telling exchange, when a supporter of the code, K Santhanam, was passionately arguing for "unity and integrity", an opponent pointed out the dangerous undertones of this argument:

Santhanam: "...the great constitution ...is based on the unification, on the integration and on the strengthening of India... Similarly, this bill is based on the principles of unification, integration and strengthening of the Hindu community. ...that Hindus should be dissected under various regional groups... is pronouncing the doom of Hindu society. Sir, the enemies of Hindu society cannot ask for anything better...

Rohini Kumar Chaudhuri: ...the hon member is speaking communalism. He is talking of unifying all the Hindus, probably against the Muslims and others."[97]

Although that may not have been the intention of the speaker, the intervener had perceived an important tendency which was to grow in the following decades, not just among Hindus but also among Muslims, and in which the enactment of the Hindu code did play an important part. This is not to suggest that all those who argued against the codification and reform of Hindu law were upholding the more egalitarian aspects of traditional customs. Nor were many of the opponents of the Hindu code bill inspired by respect for the rich diversity of India's cultures. Many were motivated by nothing better than the desire to preserve male power and privilege and felt threatened by the rhetoric of gender equality used by the reformers. Much of the resistance of Hindu Mahasabha and Jan Sangh legislators as well as the right-wing lobby headed by Congress stalwarts like Rajendra Prasad was founded in their fear that women's independence would lead to domestic disharmony and upset the social order.

Unfortunately, those holding obscurantist views on women's role in society came to be clubbed along with those who had enlightened reservations regarding the efficacy of the proposed reform effort. The latter included many members from the south who were used to traditional systems which provided far better protection to women than the modern reformers were willing to envisage.

In the debates on the Hindu code, we find many members appreciatively and with much learning elaborating the strengths inherent in the diversities of Hindu culture. Today, several of those same sections of political opinion (like the RSS-BJP) are much more

enamoured of 'unity'. Those who once advocated giving people an option or taking a referendum are today vociferously advocating the forcible imposition of a uniform civil code. One reason this important and deplorable change in perception has come about is that government's view of things has become more widely acceptable.

Limitations of Statist Reform

The government, in the name of modernising the society, was desirous of taking more and more power into its own hands. This was true of all spheres of life, and the attempt to intervene in and control people's lives is evident in the legal sphere as well. Those who saw themselves as progressives simplistically identified government control with an anticapitalist development, especially because the government used socialist rhetoric. In this attempt to use government as an instrument of social reform, not realising that usurpation of power is not synonymous with reform, the progressives were even willing to bypass the people. None of the reformers, for example, seriously disputed their opponents' contention that a large majority of those defined as Hindus, particularly in the rural areas, were completely unaware that their personal laws were being changed so drastically, or that such sweeping powers over their personal lives were being usurped by government; for example, that henceforth they would be required to make wills in order to appoint guardians for their children, or get themselves registered in order to act as guardians for their orphaned siblings, nephews or nieces. The reformers were not unduly disturbed by the ludicrousness of what they were proposing in such matters as these. This is because like the British rulers, they too were enamoured of playing god and tended to see the enactment of laws itself as a substitute for social reform.

To think that a change on paper is a change in fact has been a besetting malady of Indian social reformers right up to the present day. The solution to every problem, whether it is sati or dowry or police atrocities, is sought in yet another high-sounding law or amendment of the law, with little concern for understanding carefully the reality at the ground level. The real effect of the laws, however, is to give a sense of grievance to the group legislated upon, in this case, the Hindus, although the laws were full of loopholes and did not change anything substantially in Hindu practice. For instance, the right to have up to four wives has caused much heartburn to the anti-Muslim lobby among the Hindus. It is projected as one of the prime examples of 'pampering' the Muslim community. However, despite polygamy being outlawed under the Hindu Marriage Act, polygamous marriages are in fact as frequent among the Hindus (5.8 per cent) as among the Muslims (5.7 per cent).[38] Yet the Hindu community feels wronged because Muslim personal law had not been formally touched.

The Congress game of throwing illusory crumbs to a misguided Muslim leadership in the form of such enactments as the Muslim Women's (Protection of Rights on Divorce) Act, 1986, also has the effect of consolidating the Muslim community on the platform of resisting a uniform civil code or even any reform in Muslim personal law. (This too evolved through a similar process as the Hindu law under British rule and has little to do with koranic injunctions.) So definite has the polarisation become that even reform of the kind that has taken place in Islamic countries has not been possible in India, and women's protests from within the community are either silenced or silence themselves for fear of engendering a Hindu-Muslim conflict. Muslim belligerence on this issue only reinforces prevalent anti-Muslim prejudices and the Hindu desire for the government forcibly to impose uniformity. This trend was already visible even during the parliamentary debates during the 1950s. Strong anti-Muslim sentiment, barely held in check, was repeatedly expressed, despite the conciliatory attempts made by several Muslim members, like Naziruddin Ahmed, who, from stated motives of self-preservation, fully supported Hindu opposition to the bill. The following comment by U M Trivedi of Jan Sangh provides an example of anti-Muslim hysteria:

> ...if you desire to elevate the moral standard of the less orderly classes—well, who are the less orderly classes? They are those who can and do marry four wives—you only want to hit at the Hindu society...So, it is not going to govern a Mohammedan who walks about the streets saying talak, talak and divorces his wife.[39]

The issue (which is, in one sense, a non-issue, given the wide gap between legal precept and actual practice in both communities) has fuelled the process of Muslims being perceived by Hindus as a pampered minority, even while they continue to be deprived and discriminated against in several concrete ways. The Muslim community has lived up to the stereotype by seeing a common civil code as anathema. The Muslim leaders have not been able to come up with meaningful alternatives, nor even attempted to work out changes to give better protection to women under Muslim law, as has been done in some of the Islamic countries.

However, the codification of Hindu law did have some positive effects in terms of opinion making, and of opening a debate on women's rights. The debate enabled many people to come up with far-reaching ideas and proposals which were stimulative of discussion even if not incorporated into law. At various points during the years when the code was being debated both inside and outside the parliament, startlingly radical ideas were thrown up. Here is one example, from the written submissions to the B L Rau committee. Subramanya Ayyar, an advocate from Umayalpuram, proposed:

> ...as compared with man, women are at a considerable disadvantage... A man can lie down in open street but a woman needs the protection of a home. Similarly men can be with the minimum of clothing... But a woman has to be protected with clothing as a greater necessity. Again a man can beg anywhere and eat. But can a woman expose herself to the mercy of society in this way?... Hence... do you not think that woman should possess rights over residence, clothing and properties (the source of food) in preference to man?...Hence can you not suggest that all inheritance to properties should be woman's and not man's?...Among the Muhammadans at the time of the marriage certain portion of the properties are set apart as the exclusive property of the wife which will not be affected by debts or any other bad circumstances of the husband. ...sheer logic ...and common-sense shows that women should be owner of properties, house, etc, in preference to men,... there is nothing opposed to the fundamental principles of Hindu law that women should be owners of properties in preference to men...Please...press for these reforms even though it may mean explosion of established usage.[40]

The reform of Hindu law carried forward the tradition, already established during the national movement, of legitimising notions of women's equality in the polity and in society at large. It paved the way for further gradual reform, such as, for example, introduction of divorce by mutual consent into the Hindu Marriage Act.

Summing Up

Yet, the overall effect of the misleading rhetoric used, of codifying law only for Hindus without giving them any option, and of trying to stamp out diversity in the name of Hindu unity, was negative, insofar as:

(1) It gave Hindus the false notion that Hindu women now have equal legal rights, which is far from being the case;

(2) It created the myth that reformed Hindu law is 'secular', not 'religious' or 'personal', whereas Muslim personal law is 'religious', therefore, backward, and can be secularised only by Hinduising it;

(3) It left Hindus with a ridiculous sense of grievance. They have begun to believe that Hindu men are worse off than Muslim men because the former have been deprived of 'rights' that the latter enjoy.

Apart from causing a deep rift between the Hindus and the Muslims, some of the main problems with the acts as they were finally passed were the following:

(1) They were a curious "hybrid"[10] of Hindu law and British law, in many cases of the more irrational parts of both systems of law.

(2) In an attempt to placate the opponents of equal rights for women, the acts set up untenable and self-contradictory systems that were unworkable and could only be subverted in practice.

(3) They roadrollered out of existence a number of functioning local and regional legal systems, several of which provided better rights to women in certain respects, without setting up a functional alternative machinery to inform people of their rights under the new laws.

(4) They failed to live up to the lawmaker's stated intention of combining in the reformed code the most progressive elements of Hindu law. In fact, many of the ancient texts as well as contemporary customary practices provided better rights to women in different important respects than do these acts, which are primarily based on a combination of outdated British jurisprudence and British misinterpretation of Hindu law.

(5) Codification fossilised Hindu law and customs into a conservative mould. This need not have been the case if the reformers had seriously done what they professed they were attempting to do—viz, make the reformed law an aggregate of some of the most progressive features of various customary practices and shastric precepts. Instead they chose the very opposite route.

The reformed law turned out to be such a shabby unworkable piece of legislation because :

(1) The reformers' notion of progress was to emulate the rather conservative victorian English patterns of marriage and inheritance which were then far from egalitarian even when compared to the social norms prevailing in other western societies. Thus the Anglo-Hindu law which we were saddled with provides pitiful rights to women as compared, to say, inheritance and marriage law prevailing in the territory under Portuguese rule. The Goan Civil Code, passed during Portuguese rule is, for instance, far more egalitarian than the reformed Hindu law.

(2) Within India their reference point was the customary practices of some of the dominant communities in north-western India among whom women's rights have been seriously eroded, rather than a vast number of those which provided adequate protection to women, especially in the north and north-east. This is because the reformers inherited their zeal for reform from the rhetoric of British administrators whose perceptions had a similar regional and caste bias. Through the 19th century, they had assiduously built a stereotype of Indian womanhood derived from the life condition of those select castes and communities which practised strict purdah, forbade widow remarriage and imposed severe restrictions on women. Nair women from Kerala, meitei women of Manipur, meenas from Rajasthan or Jain women who did not fit into the oppressive stereotype, were presumed to be either non-existent or 'non-Indian'. The reforms carried out even in post-independence India envisage limited improvements, taking this limited stereotype as the universal reality all over the country. Thus in many ways the reformed law proved to be a step backward.

In the 1950s (as throughout the freedom movement period), a very large number of politicians, particularly in the ruling Congress party, were lawyers. Educated as they were in English law, they were simply ignorant of customary law. When this elite inherited the mantle of governance from the colonial rulers, they also inherited a good portion of the latter's contempt, based both on ignorance and arrogance, toward the Indian people. As a result most reform efforts undertaken by them have tended to follow the same pattern adopted by the British. Its characteristic features are : (1) an attempt to remodel Indian society to follow British norms; (2) Considering the British norms as progressive and, therefore, superior, even when in actual fact it may lead to introducing retrogressive changes and curtailment of existing rights of the colonised people; (3) Relying exclusively on statist measures such as passing laws and threatening punishment without as much as attempting to inform the people about the new laws being enacted for them, leave alone getting their approval. Thus the laws either become a source of tyranny or are ignored.

The few guarantees for women provided in the new laws could not really be implemented because the reformers did nothing to improve upon the British legal machinery which they inherited after independence. This machinery was designed for harassing and fleecing people rather than for protecting their rights. Instead of dismantling the topheavy judicial machinery and restoring or building the institutions of local and village self-rule, the rulers of independent India furthered and completed the process begun by the British. This is one reason why so many laws remain a dead letter. Unless villagers chose to spend the time and money to fight a lengthy battle at distantly placed courts in the urban centres, functioning through an alien language, the law was unlikely to intervene in their lives, especially in family matters. Bigamy, child marriage and dowry continue to exist long after they were declared illegal and made penal offences. The statist reformers can then attribute this vast gap between law and social practice as proof of people's 'backwardness'. Occasionally, they acknowledge the futility of the exercise they undertook. This is evident in their laying down that marriages solemnised in contravention of the law, for example, child marriages, would be valid.

Today, we are reaping the bitter harvest of the seeds sown by the misguided rhetoric and strategy employed by the codifiers of Hindu law. Unfortunately, the reformers of today are following the same track in their insistence on imposing a uniform civil code on all communities despite hostile, active resistance from the concerned communities. One of the reasons for this cussedness is that the progressive historians have projected the controversy around the reform in Hindu law through simplistic stereotypes which portray the pro-reform lobby led by Nehru and Ambedkar as the diehard champions of women's rights and all those who had any kind of reservations about the proposed reforms as conservative obscurantists not willing to concede equality to women. Through my analysis of the parliamentary debates I try to demonstrate that the task of moving a society towards more egalitarian and humane norms is a far more complex task than self-appointed modern reformers are willing to acknowledge. Reform, to be meaningful, has to be based on creating a new social consensus, a task seldom taken seriously by those who are enamoured with statist measures imposed from above.

The history of the Hindu law reform shows that when reformers claim to speak on behalf of huge segments of population, whose traditions and institutions they have no real knowledge of, they are more likely to do harm than good. Even the most well-intentioned reform can end up disastrously without an intimate knowledge of the community which is sought to be reformed.

This knowledge comes only when those seeking reform work closely with the communities involved and are compelled to listen to them in a way that those who control the state machinery are not. Whenever people become objects of reform, rather than active subjects, the effort is unlikely to produce worthwhile results, especially when the initiative comes from an elite which is either literally alien, as were the British, or has become alienated from the lives of people over whom it rules, as are the English-educated elite of India. Those who see themselves as reformers or revolutionaries tend to assume that all their interventions are *ipso facto* for the good of society even while they may actually be doing harm in the process. The claims of self-appointed reformers need to be examined carefully and tested through concrete proof of how their actions affect society in actual fact. Rhetorical claims about the beneficial

aspects of reform they are undertaking should not be taken as a substitute for real benefit.

Much of the current social, economic, political mess is precisely because of the governing elites' callous disregard and ignorance of the real conditions and aspirations of India's people. As one of those who belongs to India's current generation of self-appointed social reformers, I feel it is crucially important that we learn to take the people of this country more seriously, and continually subject our actions and interventions to thorough scrutiny.

Standard Chartered

(Incorporated in the United Kingdom with Limited Liability)

NOTES TO THE FINANCIAL STATEMENTS FOR THE YEAR ENDED MARCH 31, 1994

(In thousands of Indian Rupees)

1. SIGNIFICANT ACCOUNTING POLICIES

(a) General

The accompanying financial statements of Standard Chartered Bank—Indian Branches ('the Bank') are prepared under the historical cost convention (as modified by note 1(e) below) and conform to the statutory provisions and practices prevailing within the banking industry in the country.

(b) Transactions involving foreign exchange

(i) Monetary assets and liabilities in foreign currencies are translated at rates of exchange notified by the Foreign Exchange Dealers' Association of India ('FEDAI') at the year end except for foreign currency non-resident ('FCNR') account balances under the FCNR Account Scheme which are valued at the relevant rates notified by the Reserve Bank of India. The resulting profits/losses are included in the profit and loss account.

(ii) Income and expenditure items are translated at the exchange rates prevailing on the date of the transaction.

(iii) Outstanding forward exchange contracts and spot exchange contracts are revalued at rates of exchange notified by FEDAI prevailing at the year end and the resulting profits or losses are included in the profit and loss account.

(c) Investments

(i) Permanent investments
Permanent investments are carried at cost, adjusted for amortisation of premium and accretion of discount over the period to maturity.

(ii) Current investments
Investments in Government and other approved securities and other quoted investments are valued at the lower of cost or market value. Where market quotations are not available, the market value is estimated by management based on market yield expectations for investments of comparable risk and duration. Commercial paper is valued at carrying cost. Unquoted investments, including investments in subsidiary companies, are valued at cost less amounts written off, if any.

(d) Advances

Doubtful advances are identified by periodic appraisals of the portfolio by management, and appropriate provisions are made. The related interest on such doubtful advances is credited to an interest suspense account and not accrued to profits until received. Advances are stated after deduction of provisions and interest in suspense. All provisions against doubtful advances are made on a gross basis with tax relief being accounted for only in the year of write-off.

(e) Fixed assets and depreciation

(i) Fixed assets are stated at historical cost less accumulated depreciation, except premises which were revalued at March 31, 1993 and stated at market values as at that date, determined by a Government registered valuer. The surplus arising on revaluation is credited to a revaluation reserve.

(ii) Assets acquired from 1984 and onwards are depreciated on the straight-line method and all other assets are depreciated on the diminishing balance method. In respect of revalued assets depreciation is provided on the revalued amount and charged to the profit and loss account. Excess depreciation arising out of the revaluation has been transferred from the revaluation reserve to the profit and loss account. The Department of Company Affairs vide notification dated December 16, 1993 has amended rates prescribed in schedule XIV of the Companies Act, 1956. The Bank has applied such revised rates of depreciation to assets existing as at April 1, 1993 and assets acquired thereafter.

(f) Income recognition

Interest income is recognised on an accrual basis except in the case of non-performing advances where it is recognised on receipt.

(g) Staff benefits

The Bank has created separate recognised funds for pension and gratuity benefits to its employees. Provisions made for pension and gratuity benefits to its employees are based on actuarial valuation. However, retiring allowances paid voluntarily to pre-scheme retirants (i e employees retiring prior to January 1, 1978) are accounted for on a payment due basis.

Standard Chartered

(Incorporated in the United Kingdom with Limited Liability)

NOTES TO THE FINANCIAL STATEMENTS FOR THE YEAR ENDED MARCH 31, 1994

(h) Net profit/(loss)

The net profit/(loss) disclosed in the profit and loss account is after accounting for, *inter alia*, provision for income-tax, provision for doubtful advances and other necessary provisions.

2. INVESTMENTS AND CLAIMS

The developments during the current year in respect of the deficiencies identified by the Bank in the financial year ended March 31, 1993, in its assets arising from its earlier transactions in the securities markets are described below:

(i) The Central Bureau of Investigation continues to investigate the criminal complaint filed by the Bank in respect of the reported deficiencies. Civil action against several banks and financial institutions to recover amounts, some of which are also the subject matter of the criminal complaint, is also being pursued. At March 31, 1994, the assets in question amounted to Rs 12,702 million (1993: Rs 12,702 million) and are included net of cumulative provisions and write-offs of Rs 10,636 million (1993: Rs 10,636 million) as claims under 'Other Assets'.

(ii) The Bank is aware of claims against it amounting to Rs 2,204 million (1993: Rs 2,103 million), including claims of Rs 1,060 million (1993: Rs 1,632 million) which, if successful, would result in the Bank itself having claims on other parties. The claims against the Bank includes a claim for certain securities valued at Rs 216 million (1993: Rs Nil) made by the Custodian appointed under the Special Court (Trial of Offences Relating to Transactions in Securities) Act 1992 ('Special Court Act').

(iii) On January 17, 1994, the Special Court established under the Special Court Act pronounced a judgement on 'ready forward' transactions, terming them to be illegal and void. However, the judgement also stated that each 'ready forward' transaction's legality would have to be decided on the basis of facts attached to the respective transaction. The Bank's management believes that the judgement itself may not necessarily apply to its transactions. The Bank has received legal advice that the judgement may be reversed on appeal. Accordingly, the Bank has not provided for any potential liabilities based on the above judgement.

In respect of the above claims and counter claims, the Bank has obtained opinions of external legal counsel. Because of the legal and other complexities surrounding such claims, it is not possible to determine the extent of their recoverability. However, pending the eventual outcome, management considers that appropriate provisions and write-offs have been made.

Certain of the Bank's investments continue to be affected as follows:

(i) Bankers' Receipts ('BR') issued amounted to Rs 322 million (1993: Net BRs held Rs 136 million), net of assets on account of BRs held of Rs 481 million (1993: Rs 2,332 million) and Subsidiary General Ledger forms ('SGL') held amounted to Rs 2,248 million (1993: Rs 2,328 million) at March 31, 1994. Although these BRs and SGLs held, issued by nationalised banks and other institutions, have not been settled on their due dates, these have been acknowledged by the counter parties and are currently in the process of being settled.

(ii) Certain securities aggregating Rs 309 million (face value: Rs 380 million) (1993: Rs 240 million; face value: Rs 300 million) are still to be registered in the Bank's name by the issuers. The Bank is pursuing these matters to cause the registration of the securities pending resolution of disputes between the issuer and the counter party and disputes between the Bank and the Custodian.

The Bank in its past income-tax returns claimed as deductions the losses arising due to deficiencies in certain assets which are subject to consideration by the income-tax authorities. The income-tax authorities, in connection with the income-tax assessment proceedings, ordered a special audit of the Bank's financial statements and securities transactions for the two years ended March 31, 1991 and 1992. The tax authorities have not specified the manner in which this special audit report is to be used. As such, it is not possible to ascertain the outcome of such tax proceedings. Accordingly, no provision for the impact thereof has been made in these financial statements.

3. INQUIRY PROCEEDINGS

Following certain inquiry proceedings by regulators into the conduct of securities trading during the years 1991 and 1992 of some nationalised and foreign banks, the Bank, subsequent to March 31, 1994, has been required by the Reserve Bank of India to show cause as to why an amount of approximately Rs 343 million should not be levied against it for not maintaining adequate cash reserves with the Reserve Bank of India. The Bank's management believes that it has sufficient grounds to contest the show cause notice.

Further, certain proceedings relating to the operation of Vostro accounts are pending against the Bank. The outcome of such proceedings is uncertain.

Accordingly, no provision to reflect the impact, if any, of the aforesaid matter has been made in these financial statements.

Travelling	96,246	87,787

20. VOLUNTARY RETIREMENT SCHEME

Following a decision to rationalise its operations in India, the Bank, subsequent to March 31, 1994, introduced a Voluntary Retirement Scheme ('the Scheme') for certain of its employees. The Bank is currently in the process of determining the impact of the Scheme.

21. PRIOR YEAR COMPARATIVES

Prior year comparatives have been reclassified wherever necessary to conform to the current year's presentation.

Standard Chartered

(Incorporated in the United Kingdom with Limited Liability)

AUDITORS' REPORT ON THE FINANCIAL STATEMENTS UNDER SECTION 30 OF THE BANKING REGULATION ACT, 1949

We have audited the accompanying balance sheet of Standard Chartered Bank—Indian Branches ('the Bank') as at March 31, 1994 and the related profit and loss account for the year then ended. Our audit was conducted in accordance with generally accepted auditing standards and, accordingly, included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances. We have obtained all the information and explanations which, to the best of our knowledge and belief, were necessary for the purposes of our audit.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949 and the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 277 of the Companies Act, 1956, the financial statements are not required to be, and are not, drawn up in accordance with Schedule VI to the Companies Act, 1956. The financial statements are, therefore, drawn up in conformity with Forms A and B (revised) of the Third Schedule to the Banking Regulation Act, 1949.

As explained in Note 3 to the financial statements, the Bank has been required by its regulator to show cause as to why certain amounts aggregating Rs 343 million should not be levied against it. The Bank's management believes that it has sufficient grounds to contest the show cause notice. Also, certain other inquiry proceedings are pending against the Bank, the outcome of which is uncertain. Accordingly, no provision to reflect the impact, if any, of the aforesaid matters has been made in these financial statements.

In our opinion, subject to the effect of such adjustments, if any, as might have been required had the outcome of the matters referred to in the preceding paragraph been known, the accompanying financial statements give a true and fair view of the state of affairs of Standard Chartered Bank—Indian Branches as at March 31, 1994 and of its profit for the year then ended.

As explained in Note 2 to the financial statements, the Bank continues to pursue the recovery of the deficiencies identified in its assets arising from its transactions in the securities markets. Further, the Bank is aware of several claims against it, some of which, if successful, would result in the Bank itself having claims on other parties. Because of the legal and other complexities, the recoverability of the carrying amounts of such claims, and the ability to resist claims against the Bank, is dependent on the success of various pending civil and criminal actions. Pending the eventual outcome, the Bank h - nade appropriate provisions and write offs.

Further, as explained in Note 2 to the financial statements, the Bank in its past income-tax returns claimed as deductions, the losses arising due to deficiencies in certain assets which are subject to consideration by the income-tax authorities. It is not possible to ascertain the outcome of the income-tax assessment proceedings. Accordingly, no provision for the impact thereof has been made in the accompanying financial statements.

Furthermore in our opinion,

(a) the transactions of the Indian Branches which have come to our notice have been within the powers of the Standard Chartered Bank—Indian Branches;

(b) the balance sheet and the profit and loss account are in agreement with the books of account, and give the information required by the Companies Act, 1956 in the manner so required for banking companies; and

(c) the Bank has maintained proper books of account as required by law insofar as appears from our examination of those books.

Liberalisation and Small Industry

Need for New Growth Strategy in Kerala

K K Subrahmanian
P Mohanan Pillai

The growth of small industry besides resulting in employment-intensive industrialisation and wider dispersal of economic' activities ensures the maximum exploitation of latent resources, both human and material in the region. It is necessary, therefore, to design strategies and implement policies and programmes in the states for the growth of small industry in conformity with the ongoing economic reforms. A prerequisite for this exercise is a review of growth performance of the sector.

This article reports a survey of small industry in Kerala and compares it with the performance of the sector in other major states and with the all-India average.

THE process of liberalisation as part of the ongoing structural reforms in the management of the economy is getting entrenched in India. At the same time, there is the lurking fear in some quarters about negative tendencies that may set in especially with regard to equity on account of minimising the role of the government and indiscriminately relying upon the free play of market for investment allocations. For example, decisions on industrial location guided by market forces *per se* may have a tendency towards aggravating the spatial concentration of industrial activities and, thereby, increasing the disparity in development across regions in the country. The situation necessitates regional governments to take independent measures for increasing industrial investment in the respective regions.

Besides, the success of economic reforms at the centre depends on the style and speed of implementing market-friendly liberalisation measures of the states as well. State governments will, therefore, be required to have their own policy approaches towards debureaucratisation, fiscal discipline, decontrol, development of physical and social infrastructure, and other measures for creating a conducive climate for industrial location in the respective states. Thus viewed, strategies for industrial development of the states become the concomitance of macro-economic reforms of the centre. In fact, the increasing inter-state competition in recent years in offering fiscal concessions and other incentives for attracting large investments to specific regions can be seen as the manifestation of the state governments' increasing awareness of the importance of independent regional policies for regional industrialisation.

As stated in the *Economic Survey* of 1991-92, the ongoing economic reforms are introduced to "promote efficiency, reduce the bias in favour of excessive capital intensity and encourage employment-oriented pattern of industrialisation". A growth-strategy which is in conformity with the above objectives and is more complementary than competitive to wooing large investments from outside the state, lies in the promotion of modern small-scale industries (hereafter called small industry). The growth of small industry besides resulting in employment-intensive industrialisation and wider dispersal of economic activities ensures maximum exploitation of latent resources, both human and material, in the region. It is, therefore, desirable to design strategies and implement policies and programmes in the states for the growth of small industry in conformity with the ongoing economic reforms of the centre.[1] A prerequisite to such policy formulation is a review of the growth performance of the small industry in the respective states. The review along with a stock-taking of the current problems will uncover the potential as well as the constraints of each state relative to other states and help design strategies for inducing efficiency-based growth of the small industry.

The statistical data required for such review studies are scanty. However, an exploration into the area is now feasible[2] by examining the *Report of the Second Census of Small Scale Industrial Units* (covering units registered up to March 31, 1988) published by the Development Commissioner, Small Scale Industries (hereafter called census report). Although the census report does not directly give comparative statistics on growth performance of the small industry in different states as between 1972-73 (reference period of first census) and 1987-88 (reference period of second census) and relative to all-India, it is possible to generate from it the required data. In particular, such an exercise is timely and may prove useful in the case of Kerala, where for some time the commodity production has been in a crisis of stagnation[3] and efforts are now being made by the state government to speed up the rate of industrial growth.

The review has as its basic objective a comparison of the performance of small industry in Kerala relative to other major states and all-India average. The term smal industry denotes the small-scale units fallin within the purview of the Small Scal Industries Board (SSI Units) whether the are registered or not under the Factory Ac 1948. The units have an upper investmen limit.[4] The growth performance is measure in terms of changes between two time-point in regard to such indicators as number o units, value of production (output), net-valu added (income) and employment.

I
Growth Performance

We could begin with the evaluation of th growth performance of the small industry b recording the changes in selected indicator (Table 1) between 1972-73 (first census) an 1987-88 (second census). The small industr in Kerala did grow in number, but its growt record in net-value addition and employmen creation appeared awfully poor as compare to all-India. The point-to-point annua compound growth rate (ACGR) betwee 1972-73 and 1987-88 in Kerala was less tha one-half in value added, and one-third i employment generation at all-India Naturally, Kerala's share in all-India tota declined in 1987-88 as compared to 1972 73 in respect of almost all relevant growt indicators. Clearly, the tendency to depic Kerala's progress in the development of small scale industries by citing the number of unit registered without noting their dis proportionately poor contribution in term of income and employment should b discouraged; the data on proliferation o units would mystify the progress of smal industry in Kerala.

Average Size

The growth in number without com mensurate growth in other indicators lik investment, employment and value adde (income) meant that the average size of small scale units declined over time. The tendenc was found both in Kerala as well as at th

all-India level (Table 2). By 1987-88 the average size of Kerala units in terms of all the relevant indicators (except employment) was below all-India level whereas, it was higher in 1972-73 in terms of fixed investment and production. Perhaps, the higher average size in terms of employment in Kerala could be seen as a bright facet but the fact that the average size in terms of employment declined from 20 persons in 1972-73 to seven persons in 1987-88 in Kerala as against the corresponding figures of 12 and 6 respectively at all-India was discouraging. The more depressing feature was the decline in average size of units in terms of value of production (output).

Growth Performance in Neighbouring States

At this stage it was instructive to make comparison of the growth performance of Kerala with the neighbouring states of Tamil Nadu and Karnataka as reflected in select indicators (Table 3). The growth of small industry was most remarkable in Karnataka. As a result, Karnataka's share in all-India total increased substantially in all the growth indicators. In particular, its share in all-India output almost doubled whereas, the corresponding shares of Tamil Nadu and Kerala marked the decline. With respect to employment the share of Karnataka almost doubled, that of Tamil Nadu increased marginally and that of Kerala reduced by one-half between 1972-73 and 1987-88. In absolute terms, the small industry remained at the highest level in Tamil Nadu followed by Karnataka and Kerala in that order in south India. In terms of growth performance, however, Karnataka scored over the other two states with Tamil Nadu in the middle and Kerala at the bottom of the performance scale.

Overall, the growth performance of small industry in Kerala was poor as compared to its counterpart in all-India, and neighbouring states (Tamil Nadu and Karnataka). In particular, the average size of the units and factor productivity (both capital productivity and labour productivity) were lower with the result that their contribution to income generation was the least in Kerala. By all major criteria, the relative growth performance of small industry in Kerala remained poor. To wit, the symptoms of the performance-crisis were evident in Kerala small industry. Was this associated with the structure and changes therein?

II
Structural Change

The structural change could be studied by examining the changes in the pattern of distribution by size-groups and product-groups. We first examine the pattern of change in the size-structure.

Size-Structure

Here statistics on investment in plant and machinery for both 1972-73 and 1987-88 would be required. Considering that such statistics for 1972-73 were available only for a limited size-groups the change in structure could be analysed only in terms of three size groups, viz, up to Rs 1 lakh, Rs 1 to 3 lakh, and above Rs 3 lakh (Table 4).

It appeared, the smallest size group (up to Rs 1 lakh) in terms of number of units and value of production declined over the years. The change was in favour of the size-group, Rs 3 lakh and above. To some extent, the pattern of change in size-structure over time reflected the changing definition of 'small' industry. The continued dominance of the 'tiny' units in number as well as production of the small industry was, however, striking. Presumably, the predominance of 'tiny' units might have in general exerted a depressing influence on technological progress and productivity growth in Kerala.

Industry Structure

Another aspect that needed a review in relation to the relatively poor growth performance was the industrial structure. Here, we needed data on growth-indicators by product-groups for 1972-73 and 1987-88. As a very detailed product-groupwise analysis could have the danger of missing the wood for the trees[5] we considered the data at two-digit NIC product-groups. As the data in respect of value added and employment for 1972-73 were not available we carried out the analysis in terms of value of production (output). The value of production for 1987-88 was worked out at 1972-73 prices[6] for estimating the annual compound growth rate between 1972-73 and 1987-88. The pattern of distribution was, however, depicted by the percentage shares of each industry in the total output in 1972-73 and 1987-88 at current prices (Table 5).

As expected, output of different product-groups witnessed varying rates of growth. However, some sectors like basic metals and metal products recorded substantial growth rate between 1972-73 and 1987-88. Yet, more than one-half of total output in 1987-88 was shared by two NIC two-digit product-groups, viz, (1) food products, and (2) wood products. These very two groups along with rubber and plastics, chemicals and metal products accounted for more than 75 per cent of the output in 1972-73 as well as in 1987-88 though *inter se* shares were slightly different between these two time-points. One,

Table 1: Growth of Small Industry in Kerala, 1972-73 and 1987-88

Indicators	Kerala			All-India		
	1972-73	1987-88	ACGR Per Cent	1972-73	1987-88	ACGR Per Cent
No of units in census frame (lakhs)	0.11 (4 30)	0 38 (3.00)	8.62	2.58	9.87	9.36

Value added Rs	60	27	–55	60	55	-8
Employment (Nos)	20	7	-65	12	6	–50

Note: Rs in thousand, 1972-73 prices.
Source: Table 1.

therefore, can draw the inference that the industrial structure of small industry in Kerala was highly concentrated in 1972-73 and no significant change in the structure took place by 1987-88.

INDUSTRIAL BASE AND DIVERSIFICATION

Another way of looking at the structural change could be the mapping of the industrial base in 1972-73 and noting the changes that took place by 1987-88 in terms of some regional base study concepts like location quotient (LQ) and specialisation coefficient (SQ). The location quotient[7] could be used as a measure of relative regional concentration of a given industry compared to total national magnitude. A region would tend to specialise in those industries for which it would have some comparative advantage. Hence, industries with high location quotient (say LQ>1) could constitute the industrial base of the region. Keeping in view the limited data, LQ and SQ were worked out in terms of value of production (output).

It appears (Table 5) that the industrial base of Kerala small industry was constituted by a few blocks of resource-based industries, viz, food products, wood products, beverages, and rubber in 1972-73, and that more or less the same concentrated pattern (composed of wood products, food products, paper products, rubber products, and non-metallic mineral products) continued to be in 1987-88. Overall, the industrial base in Kerala was narrow and marked by the low share of modern engineering industries even in 1987-88. In other words, there was no significant level of diversification in Kerala during the period under review.

We could get a more precise idea of the extent of industrial diversification relative to national level by working out the specialisation coefficient (SQ)[8] which measured the extent to which a region showed a diversified pattern as compared to all-India. The estimated coefficient for 1987-88 was 0.34 as compared to 0.46 for 1972-73. Obviously, there was some degree of diversification in industrial production in Kerala, but it was far less than at the national level.

III
Current Status and Problems

Where does the foregoing pattern of structural change and growth place the small industry of Kerala? In other words, what is the current status of Kerala small industry in the all-India context? What are its major problems? It is against the backdrop of answers to these questions that one should draw new strategies for the development of small industry in Kerala. We already noted some aspects relevant to the questions under examination. At the cost of some repetition we take an overview of the key parameters of small industry in Kerala in 1987-88 (Table 6).

In 1987-88 there were 25,717 SSI units (small industry) in Kerala engaged in 1,708 products as against corresponding figures of 5,82,368 and 74,449 respectively at all-India. Units in Kerala are organised relatively more as proprietary units (82 per cent) located mostly in rural areas and engaged relatively more in manufacturing (60 per cent) as compared to all-India. Relatively, job work and repair/services were of lesser proportions which probably reflected the lack of engineering industries in the industrial base[9] particularly in the large and medium sectors and the lack of linkages with the small industry in Kerala. The ownership pattern was marked by relatively less involvement of scheduled castes and tribes. However, there was relatively higher involvement of women entrepreneurs in Kerala. Another noteworthy facet was the lower requirements of capital to generate one unit of employment. Also, average wages per employee was marginally less in Kerala as compared to all-India. The comparative picture was sharper in respect of money wages per worker (i e, excluding self-employed and own account workers). The small industry in Kerala was, however, seen to be haunted by some serious problems. In what follows an attempt is made to draw the contours of major problems in Kerala *vis-a-vis* other states (Table 7) and in different two-digit industries (Table 8).

CAPACITY UTILISATION

One major problem was excess capacity or low capacity utilisation. The average level of capacity utilisation defined as that part of the capacity which was utilised by the unit during the year and expressed in terms of percentage was 42.62 in Kerala as against 50.60 all-India. The performance of Kerala was worse than the majority of the states in the country.

Industrywise (Table 8), the rate of capacity utilisation in the dominant industries of Kerala (e g, food products, wood products and rubber products) was relatively lower than at the all-India level. Interestingly, where Kerala showed better performance relative to all-India were in such product-groups as electrical machinery and parts (52 per cent), metal products (47 per cent) and basic metal (46 per cent) (these could be included in the broad category of engineering) which had relatively low shares in the industrial base.

	(100)	(100)	(100)	(100)

Note: Figures in parentheses are percentages to total.

Was capacity utilisation better in the case of reserved items? Considering that reservation of items for exclusive manufacture in the small-scale sector remained a major policy measure, they should show up a better performance than unreserved items in terms of capacity utilisation. The second census revealed that out of total 846 reserved items in the country only 290 (34 per cent) were produced in Kerala. That accounted for a small share (17 per cent) of the total number of products (1708) manufactured in Kerala small industry. And capacity utilisation (40 per cent) of the units producing the reserved items was not higher, rather it was marginally lower, than that of unreserved items (42 per cent). At all-India level also the capacity utilisation of reserved items (48 per cent) was less than that of unreserved items (50 per cent). It appeared, product reservation as a policy strategy for the promotion of small industry needed a careful re-appraisal.

Employment

Turning to the question of employment generation, in the second census Kerala edged over all-India; during 1987-88 small industry provided employment to 6.6 persons per unit in Kerala as against 6.3 persons all-India. It must, however, be noted that a record better than Kerala was there in one half of the states in the country. Tamil Nadu showed a capacity higher than Kerala in employment generation though Karnataka lagged behind marginally.

In regard to employment, Kerala small industry had another discouraging feature of relatively low proportion of self-employed (14 per cent) as compared to all-India (19 per cent). The states with relatively higher proportion of self-employed were not confined to industrially advanced regions; industrially backward states like Madhya Pradesh, Rajasthan, and Bihar accounted for proportionately larger shares of self-employed in the labour force. To some extent, therefore, self-employment appeared associated with certain societal/cultural traits. And Kerala obviously was not one well endowed with such a trait. Yet, it was interesting to observe that engineering industries attracted relatively more self-employed in Kerala. Plausibly, the trend of technically qualified persons to get engaged in self-employment was picking up. Given the skill profile of the youth, therefore, there would be greater potential for the development of such industries in the small-scale sector in Kerala.

Wages and Productivity

Another feature of particular interest in the case of Kerala was in relation to the wages because the popular notion of Kerala being a high-wage economy continued to prevail and often cited as the basic constraint to industrial growth.[10] As noted earlier, the average money wage paid per employee at all-India level was marginally higher than the corresponding figure for Kerala. Besides, wage rate paid in industrially developed states like Maharashtra, Gujarat and West Bengal and the industrially upcoming states like Uttar Pradesh, Goa and Madhya Pradesh were also higher than what it was in Kerala. Yet, it should not be ignored that annual

wages paid per employee in the neighbouring states of Karnataka and Tamil Nadu were marginally lower which could make Kerala relatively less attractive for industrial investment.

Plausibly, the lower average wage rate in Kerala as compared to all-India was due to the predominance of low-wage traditional and resource-based industries in its industrial structure. But industrywise details (Table 8) showed that the wage-rate in Kerala was higher than all-India average only in three out of 16 NIC two-digit groups. In modern engineering industries (e g, electrical machinery and parts, machinery and parts (except electrical, and metal products) the average wage rate paid in Kerala was not higher than the all-India level. In a general sense, therefore, the census did not lend empirical support to the popular notion of Kerala as a high-wage region.

Yet, it must be underlined that the census data did not dismiss the wage cost as a constraining factor in the growth of the small industry in Kerala. For, average money wages *per se* was not what mattered in investment decisions. What would matter to the entrepreneurs was the wage-productivity relationship. The share of wages in the net value added would, therefore, be the relevant parameter for considering the wage-cost hypothesis. Thus viewed, Kerala was one among the few states with high proportion of wages in the value added (Table 7). The share of wages in value added in Kerala was much higher than what it was in neighbouring states as well as other industrially developed states including West Bengal. In Kerala the wage share in value added on an average (42 per cent) was nearly twice as high as the all-India (22 per cent) level. Apparently, wage-productivity relationship in Kerala was found to be relatively unfavourable for prospective investment in the small industry.

A comparison of Kerala's record with other major states showed its relatively poor performance in capital productivity: net value added per one lakh rupee fixed investment in 1987-88 was Rs 0.59 lakh and only seven states were placed below the Kerala level. The situation was not much different with respect to labour productivity. Only three states in the country recorded labour productivity (net value added per employee) less than the level in Kerala. In all others labour productivity was higher than Kerala level. By industry-group, the labour productivity was relatively lower in food products, wood products and non-metallic products, which constituted the core of the small industry base in Kerala. Also the labour productivity in these industries in Kerala was much lower than the counterparts at all-India.

What accounted for the poor factor productivity? Was it due to inappropriate work-organisation, pampered work culture, outdated capital equipment or outmoded technology? The census data did not help us to answer the question. The analysis of productivity constituted an area where detailed studies would be required for policy formulation.

'Sickness': Closed Units

Another major problem of policy interest was the 'sickness' in small industry. How seriously was Kerala small industry afflicted by sickness? The census did not collect the required data to see 'sickness' in terms of cash loss/net-worth relationship, payment default, etc, as is generally done. However, it did give details about the closed units which could be used to reflect in some measure upon the gravity of 'sickness'. For, the closed (dead) ones must have been generally the 'sick' ones. It was a consolation that closed unit as a per cent of working units (proxy for incidence of industrial sickness) was of lower magnitude in Kerala (46 per cent) as compared to all India (52 per cent). The number of closed units as per cent of working units was below Kerala level in more than one half of the states in the country. Interestingly, the incidence was relatively low in the modern engineering industries (e g, metal products, machinery (other than electrical), and electrical machinery) in Kerala as compared to all-India. By inference, the potential for healthy development of engineering industries appeared high in Kerala.

Yet more interesting was the pattern of reasons for the closure (Table 9). Unlike the popular belief, it was not the labour problem that plagued the small industry in Kerala. The more frequent cause of closure was due to financial problems. The closure due to financial problems (62 per cent) in Kerala was nearly twice that of all-India (35 per cent). This was also reflected in the composition of working capital of small industry in Kerala. Although the ratio of working capital to turnover (production) in Kerala was marginally less (13 per cent) as compared to all-India level (17 per cent), the proportion of Physical working capital was of higher order with a figure of 82 per cent in Kerala as against 78 per cent at all-India. Presumably, given the location far down the south of the country and lack of a diversified industrial base and scaler linkages within the region, the small units in Kerala were generally required to block capital for inventory accumulation even if it was uneconomic. To some measure, therefore, structural factors contributed more to industrial sickness and death (closure) in Kerala than at all-India.

Performance Crisis

Our attempt at reviewing the relative growth and structural change of small indus-

Note: CU = Capacity utilisation; NVA = Net value added; FI = Fixed investment; Emp = Employment.

try in Kerala has underlined *inter alia* its poor performance record as compared to neighbouring states or industrially advanced states or all-India. It also has highlighted some of the major problems that the small industry in Kerala are faced with. Particular mention may be made here of the relatively small size, low capacity utilisation, low factor productivity, unfavourable wage-productivity relationship and industrial 'sickness' (closure) due to severe financial and marketing problems. Thus, the signs of the performance crisis are seen in the small industry.

Our review suggests that the performance crisis cannot be explained away in terms of some unfavourable regional factors (like high money wages and trade union militancy) *per se* but has to be seen in the light of the weakness of size-structure, industry mix and other structural factors. By inference, the strategies and policies hitherto followed in the state have been ineffective to tackle the structural problems of the small industry and to facilitate its growth. It stands to logic that a change in the growth-strategies is now needed. The ongoing process of structural reforms of the centre gives an urgency to the change and to the task of designing new growth-strategies of the state government. The new strategy should aim *inter alia*, to remove structural constraints of the type uncovered by our review and help the units to reap economies of scope, sectoral-linkages and agglomeration so as to ensure the conditions for efficiency-based growth of the small industry in Kerala.

It is beyond the scope of this paper to go into the difficult terrain of strategy formulation. Yet, it may be relevant to mark the goals, which the plausible approaches should aim at. The central thrust of the government strategy hitherto has been one of promoting the proliferation of small-scale units by protective and promotional (regulatory) measures implemented through an elaborate but cumbersome system of institutional structures. This general growth strategy, which is based on the relative efficiency of large vs small question, is not of much help today because it implicitly assumes the independent existence of the small industry. The fact, however, is that the survival, performance and growth of small firms depend upon whether they led an isolated, or dependent, or inter-dependent existence [Kashyap 1992]. In the small industry, the hard thing is not being small but being lonely [Dale 1991]. It is the relationships among the samll firms and with the rest of the world that create the environment for survival and successful operation of the small industry. Although these relationships are largely based on the endogenous impulses of the firms to the socio-cultural factors and economic compulsions, these can be influenced by such government policies that induce the organisational forms and the related technological orientation and labour standards. Therefore, one crucial aspect of growth strategy for Kerala is to influence the organisational forms that establish relationship of inter-firm, inter-scale and inter-product inter-dependencies which help in reaping economies (internal and external) through division of labour (specialisation) and in expanding production possibility frontiers through innovations.

It follows that one strategy option for Kerala is the promotion of small industry on organisational patterns (e g, sub-contracting)

based on inter-sectoral and inter-scaler linkages by building up a diversified industrial structure in Kerala. However, the success of such a strategy would largely depend upon the feasibility of developing a strong and diversified large-scale sector within the region based on 'foreign' (including big national capitalists) investment!

There may also be scope for trying out, if not as an alternative but as complementary of the above, another strategy of developing space-bound clusters of small-scale industries taking into account the regional specificities of raw material and skill availability and taking advantage of economies of scope and agglomeration. A strategy of promoting space-bound clusters of small firms where each cluster is related to a specialised industry as in the southern Italy's 'industrial districts' merits consideration for Kerala. The hall marks of Italian industrial districts are traits like clustering of product-specific small firms, flexibility of product and labour markets, availability of common services and pooling of local resources, product innovation and technological change on a continuous basis [for detail, see, Taub and Taub 1989; Sengenberger et al 1991, and Pyke et al 1990]. Such a pattern of organisation with its extensive division of labour and externalities not only reduces the entry cost but is also conducive to 'collective' efficiency, with the result that small firms can not only exist but can do so with efficiency and growth [Kashyap 1992]. Though detailed studies are needed to assess the potential, it seems, there is ample scope for developing small industry in Kerala on the basis of the comparative advantage the region has in specific skills and resources for specialisation in the production of specific industries (e g, engineering, electronics, softwares, rubber products, and modern agro-based industries) by organising the units into space-bound clusters as in industrial parks/districts.

To conclude, there are clear symptoms of the performance crisis in Kerala small industry. A change in the growth-strategies is, therefore, needed. The introduction of the liberal policy regime at the centre has added the urgency to the change and the task of designing new growth-strategies for Kerala. In this regard, many crucial strategy questions come up. One is this: how to induce organisational forms whereby small firms can overcome the limitations imposed by concentrated industry-structure, tiny size, and technological backwardness without being subjected to dependent relationship. Also, how can the regional government, instead of directly intervening with the usual bureaucratic attitude, play a market-friendly role as a facilitator from a distance for ensuring competition as well as co-operation, adequate support-structures and community services, and local institutions for industrial peace and innovations so that factor productivity is enhanced and the growth of employment, output and export is maintained on the basis 'collective' efficiency by the modern small industry in Kerala.

Notes

1 This conclusion for Kerala is based on the research findings reported in the authors' CDS Working Paper (1993).

2 Recently, Sandesara (1993) has attempted a review of the progress at all-India level based on the census data. The present paper dealing with Kerala follows a similar approach.

3 See the set of research articles on 'Kerala's economic performance published in the *Economic and Political Weekly*, September 1-8 and 15, 1990.

4 The upper limit prescribed by the government changed many times. The ceiling in investment of plant and machinery (original value) was Rs 7 5 lakh for small scale and if ancillary Rs 10 lakh in 1972-73 and Rs 35 lakh and Rs 45 lakh respectively in 1987-88. The limit was revised to Rs 60 lakh for small-scale industries and Rs 75 lakh for ancillary industries in 1991

5 Sandesara op cit.

6 Wholesale price index of manufactured products was used for working out deflation factor,

7 Location quotient (LQ) was expressed as:
$LQ = (X_{ij}/X_j) / (X_i/X_N)$
where, X = relevant growth variable (e g, output)
i = ith industry
j = jth region
N = national total

8 SQ is expressed as: $SQ = \pm \Sigma \{ (X_{ij}/X_j) - (X_i/X_N) \}$
If a region was as diversified as the nation, SQ would be zero while if all its industrial activity were concentrated in an industry which in turn concentrated in that region only, SQ will be equal to zero. SQ nearer the zero more diversified the region and vice versa.

9 For evidence see K K Subrahmanian, 1990.

10 The Report of the High Level Committee of the Planning Board, Government of Kerala (1984) advanced the high wage cost as the basic cause of industrial backwardness in Kerala. Subrahmanian and Pillai (1986) rejected the wage-cost hypothesis as the dominant explanation of industrial stagnation by showing the findings to the contrary in the case of ASI factory sector. Based on the data derived for ASI sample sector Thampi (1990) emphasised the validity of high wage cost hypothesis in the factory-registered small-scale sector in Kerala. The notion of Kerala as high wage economy continues to prevail.

Ecocide or Eco-Ethic?

Rudolf C Heredia

IF there is one thing the Rio summit brought home to the third world, it was the Machiavellian primacy of politics over ethics. For, in the final analysis it was the more powerful noises that seemed to have prevailed, not the more reasonable and just causes that were heard and listened. The follow up to the summit seems only to reinforce this.

If, as L Balasubramanian observes, "the current thinking in the Indian environmental camp seems to be to capture political power at various stages of the political system", then it can hardly help to redress this balance in favour of ethics over politics. Again, if indeed "there is very little evidence of Indian environmentalists having even begun to address the problem of evolving a value system for their movement", it seems a little Quixotic to suggest that "environmentalism which has so far been developing as a new scientific discipline... has to transform itself into a modern religion...so encompassing and appealing as to make existing religions and their value systems superfluous" [1] For, authentic religions traditions cut much deeper than a political ideology, and cannot be produced by the dictate of some despot or party vanguard. And yet the urgency to develop and promote an environmental ethic with a coherent value system, one that goes beyond taboos and prohibitions to be meaningful and motivating in our present crisis, cannot be dismissed.

However, environmental ethics is still a problematic area, the more so when we realise that the ecological crisis we have precipitated both globally and locally is really the culmination of the many unresolved crises of our world, a world fragmented and disoriented, violent and alienating. We have shocked ourselves into realising how critically and crucially dependent we are on our fragile and fine-tuned environment, and how false and arrogant our presumed subjection of, and dominance over it really is. But, to adequately respond to such a crisis, we must grasp the deeper meaning it implies: that if we do not live in harmony with our environment we cannot live at peace with each other either.

For exploitation and greed *ad extra*, towards the ecological community cannot but precipitate the same *ad intra*, towards the human community, and vice versa. Indeed, it can be argued, that the root cause of the degradation and disintegration in the ecological community is the projection into it of the aggressive exploitation and oppressive alienation structured into our society. All human communities must live in and off their environment. Ecological crises were not unknown in earlier civilisations. However, we seem to repeat such history on a much grander scale. For the first time in human history, we seem capable of 'ecocide', destroying the entire ecological community altogether.

Now if the relationship of human societies to their environment is always a mediated one, this is firstly through their technology which interfaces directly with this environment. Technology does have a dynamic of its own, but at a deeper level it is oriented by other socio-cultural systems of a society. It is in this 'design for living' that ultimate human concerns are expressed in a world-view or *Weltanschauung*. The present ecological crisis, then, is forcing us back to such ultimate concerns, and any viable ecological ethic, must measure up to, and express these.

An ethic, as we understand the term, is a configuration of value preferences and behavioural norms, attitudinal orientations and motivating symbols, put together in an historical context for a specific people over time. The relationship between such an ethic to the structure and functioning of a society is certainly problematic, whether we speak of a religious ethic, like the Protestant or the Hindu one; or a secular one, like a work ethic or an ecological one. But to imagine that there is no relationship between the two is to espouse a superficial and mechanical analysis of society. Here we will attempt to sketch an eco-ethic which hopefully can restrain us from 'ecocide'.

Responses

Few people would argue that our response to the present ecological crisis has been adequate or effective. For, on the one hand, it is true that scientific environmentalism does not get beyond a technological fix, which is at best temporary and at worst superficial. On the other hand, deep ecology often gets lost in a muddled mysticism that is at best ideologically shallow and at worst politically ineffective. Moreover, while the attempt of green politics to bring together "ecology, social responsibility, grass roots democracy and non-violence",[2] has in places developed into a movement, it is as yet very far from inspiring an ecological ethic for a society. Some efforts have been made in this direction, but they have not really been effective in clearing the ground of prevailing misconceptions let alone establishing the basis for an ecological world view, a *Weltanschauung*.

Thus the 'myth of progress' still seduces us by promising a utopia of limitless growth. Indeed, in our consumerist society, it is not "religion but growth that has become the opium of the people".[3] In reaction to this there has developed a 'romantic primitivism', which idealises a 'back to nature' odyssey in response to our present problems. But neither of these can save us from the consumerist trap in which we are caught, or the downward spiral of poverty from which the poor seem to have no escape, or the 'tragedy of the commons' that is already overtaking us now, or the free rider theorem undermining distributive justice.

Indeed, where the ethical understanding of a society is itself based on utilitarian individualism, it cannot be an adequate foundation for an environmental ethic, which must involve the relationship of the community as a whole to its habitat, and not just be concerned with individuals in isolation. This is precisely the basic fallacy of the market mechanism and the invisible hand: the assumption that the good of individuals separately can be aggregated into the good of the community collectively. That is why such individualistic "freedom in community brings ruin to all".[4]

A value premised non-utilitarian ethic must be derived from a corresponding world-view. We would urge the following dimensions for such an ecological *Weltanschauung* to found an ethic adequate to our present crisis.

Firstly, *human fellowship*, not just between us in the human community but extended to the entire ecological one as well, to include the biotic and even the cosmic. Secondly, *cosmic evolution*, in which all of creation plays its part, each its own, and in which human beings, though still at the cutting edge of this process, are always 'a part' of the whole and not 'apart' from it. Thirdly, relationship to some transcendent or *ultimate reality* that will give meaning and value to our world lest we fall into the kind of anthropocentrism, that has been the bane of ecological thinking. We need to go beyond this without falling into a fragmented relativism that has little motivating force.

In the final analysis our ecological world-view must face up to the ultimate concerns of survival and salvation. And if by religion we understand, with Paul Tillich, "what

ultimately concerns man", then, our ecological *Weltanschauung* must have some religious grounding if it is to be both popular and profound. This does not mean that "environmentalism must develop for itself...the complete spectrum or religious paraphernalia".[5] Rather some radical and daring reinterpretations would be more appropriate here. Eco-ethics can thus still be scientific and secular even as they take on an enlightened and progressive religious motivation and support.

Thus the story of creation in the semitic religions must be reinterpreted to mean not dominance, and subjugation of the earth, which only traps us in an ecologically insensitive anthropocentrism, but a companionship with, and a responsibility for all creation in our common 'creatureliness', which would be more biocentric. The commanding Hindu metaphor of the world as the body of god, deriving from the ancient *Rigvedic* myth of a cosmic person ('purusha'), can dramatise for us this reality as the very ground of our being, without the escapism of an 'other worldly' 'moksha', or the fatalism of a this worldly 'karma'.

This *Weltanschauung*, of human fellowship, cosmic evolution and transcendent reality, must indeed be spelt out into an eco-ethic which is both down to earth and meaningfully motivating. Such an eco-ethic cannot be effective merely as a matter of personal morality. It must be articulated and structured in the values and norms, the attitudes and motivations of a society. What we need is a new paradigm for society, supported and maintained by such an ethic. We here indicate some of the essential parameters of such a paradigm corresponding to the three dimensions of our eco-world-view.

Firstly, human fellowship must be expressed in the primacy of the common good, understood as those conditions that make it possible for the members of the community to achieve the fulfilment of their nature. This goes beyond a utilitarian calculus of the greatest good for the greatest number, and must be foundational for our paradigm. Further, to achieve this common good a society must be structured on the principle of subsidiarity and its obverse, i e, neither abrogating authority upwards for what we can do at lower levels of a community, nor abdicating responsibility downward for what must be done at higher levels.

The values supportive of such subsidiary are expressed by 'solidarity', a term which here attempts to encompass our inter-relationships and inter-dependence, as well as each one's individuality, and uniqueness. Ideally such a society would be egalitarian and participative for it would not be a mass society but one on a human scale, concerned with 'being' rather than 'having', to use a distinction from Eric Fromm, a community of free persons, where, as Marx has said, the freedom of each must be the condition of the freedom of all.

Secondly, cosmic evolution must mean a regenerative development. For such a society growth would be not just sustainable, but regenerative as well. This implies more than just leaving the environment uncompromised by degradation and pollution, but renewing it to create a new earth community—to reach beyond our grasp. Such development can of course only be in terms of a qualitative growth not merely a quantitative change, a "limitation of the empire of necessity and the widening of the sphere of freedom", in Christopher Dawson's words.[6] For this we must learn from the Taoist ethic of frugality, of "grace without waste", and not merely a contractual ethic of accommodation.

Thirdly, a relationship to a transcendent or ultimate reality in the context of this human fellowship and the developmental process must leave no room for a metaphysical pessimism of the myth of the eternal return. Rather it must be expressed in terms of a *purposeful teleology* that will help us to take responsibility for our future. Ernst Bloch's *Philosophy of Hope* could be of help here.

The common good, regenerative development and purposeful technology must be elaborated further into a charter of human rights and cosmic duties. The first deriving from Roman law and articulated in Kantian terms in the west is the foundation for idea of inalienable rights. But this must be checked and balanced by the second, which can be found in the complex Indian tradition of dharma, as the performance of duty that keeps the world in right order and harmony. Together these help to break away from a one-sided ethic, be it anthropocentric, biocentric or cosmocentric, to a more holistic ecological one.

Too often the immediate urgency of the ecological crisis displaces issues of ultimate concern, with which we must come to terms for any creative solution to our present crisis, rather than merely a superficial fix, technological, political or otherwise. Of course, our response to the ecological crisis must find a social expression that effectively impinges on, and restructures our society. It cannot be just a matter of individual morality. For unless we overcome the alienation and anomie of our human community, we can hardly expect to live in peace and harmony in the ecological one.

James Gleick writing on *Chaos* speaks of the "butterfly effect"; an inconsequential cause precipitating gratuitously disproportionate consequences. Thus he explains how the flap of a butterfly's wing in Tokyo might upset a delicate meteorological balance and precipitate a cascade of effects that finally result in a hurricane in Havana! In facing the overwhelming ecological crisis that confronts us today, we can still hope that we "act locally", and even though it may seem as inconsequential as the beat of a butterfly's wing, we may still be able to provoke people to "think globally", and so revolutionise our ecological consciousness precipitating a new ecological ethic.

Ultimately our relationship to our world, as Bernard Lonergan[7] remarks, is "mediated by meaning and motivated by value". But if such mediation is to result in a lasting and effective ethic, then it must be symbolically expressed in social rituals, and in common images. This is what gives popular religion its enduring influence. We are not about to advocate an eco-religion. Better a sound secular ethic than a pseudo-religious one. However, we still are a long way from either. Perhaps the rite of a common meal, a "sahabhojan", building up the life of the commonweal could be the beginning of a ecological ritual that would symbolise and effect our common union with each other and the world around. We need also a myth, a new creation story to re-enchant the world for us, to re-enact and dramatise our place in the cosmos and our relationship to it. All this can be essentially secularly and rationally scientific without being irreligious or pseudo.

As yet we have no much common ecological myths or rituals. But we do have a compelling image of our planet in our space age world: a beautiful and fragile blue sphere, floating free and precariously in the dark of empty space. This is our Gaia that we have violated and now waits to be healed, that we have degraded and now wants to be renewed. Hopefully we still have a chance to make it a place where children can play, where laughter can be heard, and where we can all dance to the music of the universe, and watch the earth-rise to, not the sunset on, our future!

Population and New World Order

Western governments and UN agencies are proclaiming that population growth must be controlled in the interests of development and for the sake of women's rights. But the question which will be vocalised in the alternative NGO conference parallelling the International Conference on Population and Development at Cairo next month will be whether women really have any say in the population control strategies being evolved ostensibly for their well-being. **2201**

The national population policy draft submitted to the government by a high level expert group is not only heavily biased against women but will, if its recommendations are implemented, lead to a centralisation of power and authority. **2189**

Implementing Reform

If South Korea shows that the state can effectively intervene in the economy, the examples of Chile, Argentina and Mexico suggest that turning all decision-making over to the market can backfire. What will happen in India remains to be seen. **2209**

Forests vs People

The recent state initiatives in the forestry sector, such as the proposed Forest Act, seek to continue a century-old process of discriminating against the rural, and especially tribal, poor which will lead inevitably to an escalating conflict between forest communities and the state. **2192**

Burden of Debt

India's external debt has not only grown rapidly over the 1980s, but has been contracted on increasingly hard terms. What are the reasons for the surge in the debt and its servicing burden? **2232**

No Credit

Reports indicate that the full beneficial impact of the good monsoon will not be realised for want of bank credit to farmers. This calls for urgent corrective action. **2197**

Visual Impact

A recent report by a group of child psychologists in Britain shows that there is a definite link between violence portrayed on television and aggression in children. **2198**

De-Islamisation

The mass conversions of Muslims to Hinduism, which have largely occurred in the backward regions of northern India where brahminism has not yet been challenged by assertive 'lower' castes, have generally focused on the process of de-Islamisation rather than on acceptance and assimilation of the Hindu religion. **2214**

Keynesiana

A question which has teased many a curious mind is what triggered Keynes's interest in India. **2205**

Water for All

The people of Saurashtra have, this summer, taken the initiative to evolve a sustainable means of overcoming the perennial water crisis in the region. **2199**

Too Close

The central problem that has both constrained and distorted the performance of public enterprises in this country is an unhealthily close dysfunctional relationship between them and the government, preventing the enterprises from functioning in a business-like manner. **2246**

Signals of Corruption

THE prime minister, P V Narasimha Rao, while turning down the demand of Congress members of the parliament for taking action against S Venkitramanan, former Reserve Bank of Governor, for his involvement in the bank scam, is reported to have indicated that the government of India taking any action against Venkitramanan would send wrong signals abroad and hurt the country's image in the international community. He parried by asking his colleagues: "Have you thought of the reactions of other countries if we sent a former governor of our Reserve Bank to jail?" To his colleagues from Maharashtra his onslaught was more direct. He quipped: "Why should the government submit to the opposition pressure? Once you start yielding, there will be no end to yielding. It will set off a chain reaction and you will have to face a similar situation in Maharashtra as well. Are you prepared for that?" The Maharashtra MPs were totally disarmed by the PM's counter-offensive. They realised that they shall have to keep their mouth shut to protect their chief minister.

The people of India still have no idea of what signals the government would like to send to other countries and especially to the rich countries. If recent government decisions and actions can give hints on the working of the mind of the prime minister and his ministers, they are these. They want to tell the world that though frauds and scams abound in India because of the complicity and failure of the ministers and the administrators, no action would be taken against them and they would be continued in the same positions which provided to them the opportunity to perpetrate massive frauds on the people of India. Ministers and administrators are indemnified against any enquiry and prosecution for wrong doing, complicity or dereliction of duty.

The prime minister wants to tell the world that the government is not concerned about corruption albeit it would like the foreign business houses to indulge in corruption for obtaining extra territorial and extra legal concessions from the government as such an approach would ultimately provide to the ministers and administrators additional grounds to make money through corruption, nepotism and favouritism.

The prime minister wants to send signals all over the world that giant business houses wanting to enter Indian market would have all the opportunity to mop up unprecedented profits, much higher than they have ever dreamt of realising in their own country. They would further be protected through government assurances and guarantees even though such guarantees are bound to spell disaster to the country. He wants to tell the world that the foreign business houses will be given special facilities, denied to Indian entrepreneurs all throughout, to collect jacked-up capital costs from India and to charge anything for the services and goods that they may develop in the country.

KISAN MEHTA

Controlling Tobacco Use

RAJESH KUMAR (July 16) has stressed on legislation, taxation, administration and education as an approach to the solution of the problems caused by tobacco. However, he has forgotten that the attachment to the use of tobacco is more psychological than a habit. A person, addicted to tobacco is generally hesitant to give up the habit even if he suffers from it. No education or legislation or other solutions will persuade such a person to give up tobacco.

In Bihar, Orissa, West Bengal and UP, persons are more prone to chewing tobacco which is also a matter of social status. For example, a school teacher will say in Orissa that it is his profession which forces him to chew 'paan'. Private surveys indicate that in Orissa around 95 per cent of school teachers and 65-75 per cent of state government employees chew 'paan' habitually. In Bihar it is 'khaini' and in other states there are forms of tobacco which are not taboo. While the economic burden may restrict a person's tobacco habit it cannot cure the person completely. Hence, taxation, is not going to curb the problem.

The most practical solution lies in the establishment of de-addiction centres, in addition to the solutions suggested by Rajesh Kumar. Both the educated and the illiterate are aware of the fact that tobacco is harmful, yet they have not the courage to kick the habit. The establishment of de-addiction centres for tobacco users may involve a high investment but in terms of national health, productivity and an improved standard of living, the returns will also be very good. Co-operation between the government and the NGOs on this will be desirable. The centres will provide a good solution because: As tobacco is not socially taboo, people will not mind visiting de-addiction centres; users generally want to give up the habit but cannot do so on their own—the centres can provide right guidance to them; and often giving up one form of tobacco use leads the person to use another form which can be prevented at de-addiction centres. However, the de-addiction centres should be exclusively for tobacco. If combined with other centres for drug or alcohol abuse the very aim will be hampered and will not serve the purpose.

MANOJ KUMAR SAHOO

Bhubaneswar

In Custody

"WHERE law ends tyranny begins" observes the constitutional bench of the Supreme Court in its majority judgment upholding the constitutional validity of the Terrorist and Disruptive Activities (Prevention) Act, 1985. The irony of the statement, not surprisingly, completely escaped the honourable judges who were deliberating on an act which represents the single most tyrannical means of oppression the state has armed itself with on the pretext of protecting national interest. The TADA, its promulgation, its continued extension and its extensive use, underlines the failure of the democratic polity and an abdication of responsibility by the judicial system. It has taken nine years and 400 writ petitions for the apex court to uphold the constitutionality of the act. Nine years in which the act originally applicable in two union territories and four states as a temporary measure to deal with what was construed to be an extraordinary situation in order to protect the 'unity and integrity of the country' has been repeatedly extended and has now been invoked in 23 states of the union. Nine years in which the act has been blatantly misused to tyrannise the powerless—the minorities, political dissenters, tribal groups, petty offenders and anyone who poses a threat, however temporary or mild, to the state and its minions.

The myth that was created to justify the necessity of this bit of legislation in the first place was that the existing criminal procedures were insufficient and inadequate to deal with the situation created in the wake of the Khalistani secessionist violence and to provide speedy trial especially where the perpetrators were powerful enough to intimidate witnesses and otherwise subvert the law. Ironically enough the legislation has, in fact, encouraged delay in legal proceedings and undermined the process of law. Of the 52,998 persons arrested under TADA up to March 1993, only 434 were finally convicted and of these none under the section relating to 'terrorist activity'. Only 12 per cent of those arrested have even been chargesheeted and only in 1 per cent of the cases have the detenus been brought to trial. Because those arrested under the act may be detained without trial for a period of 180 days and chargesheets may not be filed up to a year, a desultory approach to documenting the charges and collating evidence has resulted. The normal safeguard available to those arrested, that they have to be produced before a judicial magistrate within 24 hours after arrest, is eliminated if TADA is invoked. Besides, the act condones, even encourages, procedural norms which make for fair treatment of the detenus. The admission as evidence of confessions before superior police officers, while it is frowned upon by the Supreme Court, has been upheld in the constitution bench decision. However, the two minority judgments of the same court have roundly condemned the procedure drawing attention to the fact that confessions are often extracted during custodial interrogation (read torture), and irrespective of the rank of the officer cannot be assumed to have been given voluntarily and not under duress.

The ease with which this act, ostensibly aimed at dealing with terrorist activity, has been extended to several states is an ominous comment on the state of public and parliamentary ignorance and unconcern about state repression. The act automatically comes into force in an area which is declared to have been affected by terrorist activity. But incredibly, some of the largest detentions have been in Gujarat (number of detenus, 14,094 in 1992) where the act was brought into force ostensibly because of "security problems in the sensitive Kutch border district". It has been extensively used in the state to apprehend people during communal violence, against farmers agitating in Mehsana district and against labourers demanding land in Morvi village. So threatening is the use of the act that it has become a means of extortion: the rate for avoiding being arrested under TADA in these parts is said to range from Rs 1,000 to Rs 20,000. In Gujarat particularly, but also elsewhere, the act has acquired a communal image. So much so that the Minorities Commission has called for repeal of the act. Not only has it been used against Muslims but also against other minorities. In Uttar Pradesh during BJP rule it was used as a generalised measure to repress the Sikh community, especially in the Terai region: of 118 people arrested in 1992, 116 were Sikhs.

That the TADA provisions blatantly violate constitutional assurances is well known. Not even the apex court's judgment denies that. However, it condones these violations for the greater good of the 'nation'. Judging whether an act which in the nine years of its operation has been extensively used to suppress constitutional rights may be said to be functioning for the good of the 'nation' is evidently an onerous task.

Perhaps the most depressing aspect of the act is the ease with which people's representatives in parliament and in state assemblies have allowed it to be extended time and time again. Not that the ruling party has not been skilful enough in managing the show. Each time the act has had to be extended, the matter has been introduced in parliament in such a manner that debate is sidelined or, by the very nature of the proceedings, suppressed altogether. For instance, in 1987 when it came up for extension for the first time, a bill to the effect was introduced along with a bill relating to president's rule in Punjab; in 1989 it came up for discussion along with the Chandigarh Disturbed Areas (Amendment) Bill; in 1993 along with a bill amending the Indian Penal Code at a very late hour after a long and trying session. The easy passage through parliament is matched by the lack of consistent mobilisation to oppose the extension of the act.

TADA represents the high point of the response of a state apparatus which can and has legitimised tyranny by circumventing in part and co-opting in patches the judicial and legal arms. Opposition to such a measure cannot be confined to the courts, but must become generalised. In its absence, the TADA will not only legitimise, as many believe it has already done, procedures which do not afford safeguards but turn on its head the long held principle of justice that an accused is presumed to be innocent unless proven otherwise.

POWER

Uses of Public Sector

THE power minister, N K P Salve, has come out with views on the privatisation of the public enterprises under the control of his ministry which are, on the face of it, at variance with the government's acknowledged policies on the subject. In a newspaper interview earlier this month he disclosed that he was against selling off shares of central power companies.

It does not follow, of course, that what Salve said in fact represents the government's policy or that the government will not, in due course, bring the public sector power companies within the ambit of its disinvestment programme. What is quite likely is that the power minister, after being seen to give in to one demand after another of intending foreign investors in the power sector, including agreeing to a guaranteed rate of return on investment and a sovereign guarantee by the government of India in respect payment for power sold to the State Electricity Boards, was just trying to refurbish his political image by appearing to take a stand against privatisation.

These are games politicians play and should not be taken seriously. What does deserve some notice is the argument advanced by Salve in support of retaining the central power companies in the public sector. According to him, because of the high capital cost of the power projects to be put up by the foreign companies, there will have to be a sharp rise in electricity tariffs. This is true enough. In fact this precisely has been a major criticism of the terms agreed to by the government for the proposed foreign investment in the power sector—that thanks to these terms, the foreign companies' cost of power generation will be roughly treble the current cost or even more. Where the power minister is clearly guilty of sleight of hand is in suggesting that the public sector power companies will be the beneficiaries of the upward revision of power tariffs and that, given the lower capital costs of their power plants, they will emerge as money-spinners for the government. The minister should know better than that; he no doubt does.

In the first place, it has been calculated that even with a three-fold rise in electricity tariffs the state electricity boards will be paying more to the proposed new foreign power companies than their selling price to the consumers. Further, the assumption that increases in the electricity tariff steep enough to meet the foreign companies' cost of generation will in fact be feasible is optimistic, to say the least. Apart from the serious impact of so sharp a rise in the price of a vital input like power on different sectors of the economy, there is the question of its political acceptability. It is instructive that even the National Development Council's high-powered committee on power, headed by the Maharashtra chief minister, while stressing the need for eliminating subsidies on electricity consumption, has suggested a tariff of no more than 50 paise per unit for power supplied to agriculture, against even the present average generating cost of about Rs 1.05 per unit, and this recommendation too has been promptly opposed by the three other chief ministers, those of Punjab, Karnataka and West Bengal, who are members of the committee. Clearly, the burden of paying the guaranteed price to the foreign companies will have to be shared out among the state electricity boards and the public sector power companies. The suggestion that the latter will shortly, and as a conse-quence of the entry of the foreign companies, turn into rich sources of divided income for the centre is disingenuous in the extreme.

There is yet another consideration to be reckoned with. Among the terms insistedupon by the foreign companies is not just a guaranteed price but also a guarantee of offtake of the power produced by them. This is expected to entail the SEBs being forced to reduce their offtake of power from the other suppliers, the public sector companies mostly, even though these may be lower-cost sources.

The burden of the extra-special terms which have been offered to the foreign power companies will, it is clear, fall on the rest of the power sector, apart from on the consumers of power. In this prospective scenario, the government will need to continue to have the public sector power companies under its control so that they can be made to absorb the costs of the foreign companies' entry into the power sector. Could this not be the calculation behind the power minister's unexpected enthusiasm for retaining the centre's power companies in the public sector?

BODO AGITATION

Price of Double-Dealing

Kamaroopi writes:

THE latest incident of arson and killings in the Bodoland Autonomous Council (BAC) area is part of a chain of events and initiatives, double-dealings and double-talk, whose origins go back to the very aims and objectives of the agitation for the creation of Bodoland; and which became even murkier after the signing of the Accord.

Hundreds, almost all of them descendants of persons of erstwhile East Bengal origin popularly (and wrongly) described as 'immigrant Muslims' (it was their ancestors who were migrants), have been killed in these incidents; and thousands have been rendered homeless. Many of those rendered homeless in the first of these outbreaks in October last year are yet to return to what is still left of their 'homes'.

The latest outbreak in several villages of Goardhana mouza under Barpeta Road police station began on July 19 and peaked with the attack in the small hours of July 24 on a relief camp at Bashbari near the Manas National Park (large areas of which have fo years been taken over by Bodo militant where victims of violence over the previou three or four days had been 'sheltered' b the administration. Indeed, the attack on th Bashbari camp took place when curfew wa in force in the whole area, the security force had orders to 'shoot at sight' any rioters, an virtually the whole political, civil and polic administrative leadership of the state startin with chief minister Hiteswar Saikia wer camping in the area.

There have also been several reports whic suggest that the riots were the outcome c some 'unorthodox' initiatives by the stat police in the wake of the blowing up of police vehicle by suspected Bodo militant on July 13 in the same area, in which th Additional Superintendent of Police c Barpeta district, along with six policemen was killed. A senior police official and minister have been named in several of thes reports as having incited a section of yout of immigrant origin (euphemism for Muslir youth) to attack Bodo settlements; and th Bodos are believed to have retaliated.

The official death roll is 61, including 1 'miscreants'; but the actual toll is believe to be much higher, with some minorit organisations putting it in four figures. Th armed forces, which have authority to operat in the whole state under the Armed Force (Assam and Manipur) Special Powers Ac notification issued towards the end c November 1990 for Operation Bajran against militants of the United Liberatio Front of Asom (ULFA), have been deploye The chief minister wants the armed force to act "independently of civil authority" i seven districts which come under the BAC

These are the facts. But facts by themselve do not explain the sustained virulence of th violence, or its persistence. As noted earlie the present events are causally related to th very ideology that sustained Bodo separati (or nationalist) aspirations, the apprehensior about loss of land, and the compromises th leadership had to make for a thoroughl opportunistic and unworkable deal, whos object was never any concern over the re problems on the ground, but self-promotio and cutting to size other leaders of faction of the establishment in Delhi and Dispur an possibily, also in Kokrajhar.

First, the demand for Bodoland. Th changes and the modifications in th demand ever since it was first put forwa by the All Bodo Students' Union (ABSU only underscore the lack of realism of the aspirations masked by high rhetoric abo threats to 'ethnic identity'; and their demons rated capacity to execute threats of widespre violence and disruption of normal life in th whole of the north-east. However, the uppi of the ante in Bodo nationalistic assertion h also to be related to the state government' indifference to the ABSU's more reasonabl demands. The memorandum submitted t Hiteswar Saikia on January 2, 1984 ABSU's 'long-standing grievances' did n mention separation from Assam or eve

political and administrative autonomy. The 46-point memorandum deals almost entirely with matters educational and cultural.

However, Demand No 46, dealing with the 'foreign nationals issue', has this significant passage: "...the influx of the non-tribal immigrants and foreign nationals is still going on in Tribal Belts and Blocks and other predominantly general tribal areas of entire Assam unchecked, thus outnumbering and outbalancing the indigenous peace-loving Plains Tribal people of Assam... Today it is practically seen with bitter experience that all 33 Tribal Belts and Blocks including predominantly general tribal areas of Assam have been pushed into a crucial position of being annihilated and extinguished totally by the unchecked continuous encroachment and influx of the so-called non-tribal immigrants and foreign nationals, and the same process has been rendering thousands of tribal people landless and insecure in all spheres of their community life."

The (first) Hiteswar Saikia government did precious little about these modest and legitimate demands and grievances. Later, due to various complex factors (including the restrictive concept of who and what constituted the Assamese nationality projected during the anti-foreigner agitation) the tribal youth leadership felt alienated from the 'brave new world' promised by the political successors of the anti-foreigner agitation, the Asom Gana Parishad government, and launched the agitation on March 2, 1987 for the creation (initially) of "a separate state with the status of a Union Territory for the Plains Tribals in the northern valley of the Brahmaputra"; for "District Councils in the Tribal compact areas of Southern valley of the Brahmaputra"; and for "Regional Councils for non-Karbi tribes in Karbi Anglong Autonomous District Council". Over the years, the fiction that the demand for Bodoland reflected the aspirations of all the plains tribal people of the state was dropped. Indeed, when the deal was finally clinched, even the demand for Bodoland was dropped.

WOMEN

New Words for Old

THE right words are all there. There is no quarrelling with the concepts either. The country paper for next year's Beijing conference on women which is doing the usual rounds can't be faulted for not viewing women as an integral component of development issues. Nor is there a dearth of progressive rhetoric. Drawing from the large body of data which has now accumulated, the document delineates the role women play in society, a role that has been under-recognised, underemphasised and trivialised. The fact that development programmes, even if they are not directly detrimental to women, often change the social situation in such a manner that women are disadvantaged, is also recognised.

The central focus is on the large proportion of women who live in extreme poverty. The document points out that "economic insecurity, large family size and domestic violence all combine to make the situation of women in extreme poverty such that it requires special attention by government and other agencies since extreme poverty by definition implies low absorptive capacity for development programmes". However, focusing on women as economic and not social categories does not solve the problem since the overall status of women remains unaffected. Programmes of empowerment for women such as facilitating asset ownership, encouraging legal literacy, etc, are some positive measures. The two-pronged approach suggested in the document is to stimulate and extend coverage of policies directed at asset creation and appropriate measures to ameliorate the immediate situation.

The document does not attempt to gloss over the impact of the new economic policies on women either. While admitting the difficulties of assessing such effects because of the short time span which has elapsed since the introduction of some of the policies, there is nevertheless a recognition that, women may bear a disproportionate brunt of the recessionary policies which lead to an increase of open employment. Further, the general emphasis on tradable goods may negatively affect the self-employed women who primarily deal in non-tradable goods. All this will offset the increased employment opportunities in the services sector and in export-oriented industries and may lead to households resorting to survival strategies which inevitably increase the burden on women.

One might suppose then that the department of women and children and the government have taken cognisance of the extensive damage that economic and social policies have caused to those who hold up half the sky. Such an extraordinary degree of gender sensitivity might, one would assume, lead to the logical conclusion that policies which contribute to the limiting of opportunity for a fair and healthy livelihood and a diminishing of access to material resources are in sum the single most important cause for women's deprivation.

That however is not the object of the exercise. The increasing visibility that women are receiving in public policy has overall less to do with a deep comprehension of their historic social disability than with the clear understanding of the imperative need to fill the yawning spaces in an economic structure being rapidly distorted. By demarcating for women, as a matter of considered choice, the self-employed and to some extent the informal sectors, the gathering storm of the poor and the marginalised is sought to be dissipated. Using the rhetoric and reason of the women's movement, self-employment is projected as a particularly ideal option for women, given their 'other' responsibilities of reproduction and nurturing. Conveniently, this also absolves the state of all responsibility of providing welfare services or of ensuring that the historic labour rights such as the limits of a working day are enforced. This is making a mockery of empowerment even though in narrow terms it provides the wherewithal to survive. By integrating such concepts into policy, the state is giving notice of the fact that the impact of the economic reforms on women will not be an interim phenomenon, but a permanent feature.

POPULATION POLICY

Missing the Point

A correspondent writes:

QUITE understandably, the National Population Policy recommended by the Expert Group on Population Policy headed by M S Swaminathan has fallen foul of the government bureaucracy as well as the non-governmental voluntary sector.

As for the bureaucracy, the officials of the department of family welfare are upset because the expert group has suggested the virtual dismantling of the department and its replacement by an autonomous structure—the Population and Social Development Commission (PSDC)—to be headed by "an eminent social worker or a professional respected in the country for commitment to the cause of population stabilisation and social development" and reporting directly to the prime minister. Addressing a press conference in Delhi recently, a member of the expert group lambasted the department of family welfare as a "non-functional body interested only in chasing targets and statistics". He further accused the department of spreading 'disinformation' against the expert group through the press with the purpose of consigning the National Population Policy to the backburner.

The expert group has suggested that no separate secretary of the department of family welfare will be necessary. This is naturally feared as a setback for bureaucrats seeking promotion to senior posts in a profession which is already choked by an excess of officials still awaiting promotion. With the fast-shrinking possibilities of upward mobility in the existing structure, the more proliferation there is of new departments—and new ministries with their respective wings—the merrier for the bureaucrats who are running the rat-race in the civil services. In contrast, in the police and defence services, the government has been encouraging the breeding of newer and newer paramilitary departments—the latest being the establishment of the Rashtriya Rifles, a new paramilitary arm under the army command—which provide berths for ambitious police and army officials at different levels in the hierarchy of these new departments.

But to come back to the expert group's suggestions, they are made in the context of the government's policy of decentralisation

and stress on the 'panchayati' system. The group opines that "the target-oriented approach of a centrally-sponsored/vertical programme has to yield place to a people-oriented, decentralised approach" and then suggests the integration of the family welfare programme (which includes population control measures) with other health care services run by the department of health. It therefore wants the panchayats and nagarpalikas to "prepare a socio-demographic charter for the respective village, town or city" with specific goals for "population stabilisation developed after discussion among the people of the area" to indicate the steps "which the local community plans to initiate for ending social evils like dowry, child marriage, female foeticide and infanticide and female and male illiteracy."

While these normative guidelines are fine and acceptable by those opposed to the 'social evils' mentioned above, one wonders whether the members of the expert group are familiar with the ground reality in the countryside where the panchayats are supposed to be agents of decentralisation. Till July this year, out of the 25 states, in 16 elections to the various tiers of the panchayati system—gram panchayat, panchayat samiti, zilla parishad—had not been held. Even if they are held, one wonders whether they would make any difference, since the tradition bound, orthodox village elders who hold sway (particularly in the rural areas of the Hindu-Hindi heartland) are likely to call the shots, and dominate the panchayats. It is these elders who have been meting out punishments in village community gatherings against inter-caste marriages (sometimes by issuing edicts to kill the 'dalits' who dare to choose partners from the upper castes, as has happened in villages in Uttar Pradesh and Bihar), who have been encouraging their followers to lynch women on false charges of witchcraft (in the tribal villages of Bihar and West Bengal), who have been issuing religious 'fatwas' against people daring to challenge the elders' orders (in Muslim-dominated villages).

The expert group has approvingly referred to the laws enacted in Haryana and Rajasthan debarring persons who do not adopt the two child family norm from contesting elections for panchayats, zilla parishads and nagarpalikas, and recommends that there should be a code of conduct which enjoins on all elected representatives of the people, from parliament to panchayat, to adopt voluntarily the small family norm. Does the group seriously believe that the powers that be—irrespective of political loyalties, whether in the states or the centre—the ministers and MPs and MLAs, who themselves breed large families will accept the recommendation? As one member of the group cynically suggested at the press conference, such a recommendation, if implemented, will be the end of politicians of the likes of Narasimha Rao and Laloo Yadav! Obviously, it is convenient for these leaders at the top—the chief ministers of Haryana and Rajasthan and their ilk—to impose the small family norm at the rural panchayat level (which could debar the small farmer or the landless peasant who might want more children to help him in the fields or supplement his meagre income, from contesting the panchayat elections). Significantly, the Haryana and the Rajasthan governments have refrained from imposing similar norms on candidates for assembly and parliamentary constituencies.

SRI LANKA

Vote for Reconciliation

WITH the swearing in of Chandrika Kumaratunga of the People's Alliance (PA) as the prime minister, 17 years of rule by the United National Party comes to an end in Sri Lanka. More importantly, the change of government offers new ground on which to confront the ethnic problems which have beset the country for several decades now. Whether the opportunity will be grasped depends very much on the degree of coherence the winning alliance is able to sustain in office.

In fact towards the end of the election campaign the UNP, now clearly losing ground, began to throw wild accusations at the Alliance's pact with the Sri Lankan Muslim Congress (SLMC) and allegedly the LTTE. Certainly, the PA had come to an understanding with the Muslim Congress which had in the last government supported the UNP. In this election, all the Alliance candidates in the north-eastern province contested on Congress tickets, while Congress members contesting elsewhere did so on Alliance tickets. The campaign clearly indicated the results that were to follow. There was enthusiastic support for the Congress in alliance with PA mainly because of disenchantment with the UNP's lack of progress in resolving the conflict in the north-east. The PA is seen as having greater chances of success, not only because it has made attempts to initiate a dialogue with the LTTE, but also because Vijaya Kumaratunga, party leader Chandrika's late husband, was the only leader of a major Sinhala party to have ever visited the north-east and shown a genuine interest in reconciliation.

Undoubtedly, the hope that there would be a solution to the long drawn out conflict explains the 49 per cent vote that the Alliance polled. Despite the fact that the UNP and sections of the Buddhist clergy tried to raise the bogey of a country succumbing to Tamil manipulations and acceding to an ethnic divide, the alliance has registered overwhelming support in the Sinhala dominated south, south-central and central provinces. The conflict in the north-east has been a huge drain on the Sri Lankan economy and a resolution of the tensions there, people perceive, would go a long way towards the institution of much needed developmental programmes. This has again served to capture the youth vote for the PA, which with the JVP out of the way provided the only focus, especially for first-time voters. With its 105 seats and the seven won by its ally the SLMC and one by an independent group, the PA is all set to form the government.

The elections in the north have, as expected, been a farce, with government control not going beyond Vavunia and the LTTE boycotting the elections. Despite heavy security, the LTTE managed to blow up a 400-tonne ship in the government-held harbour of Kanakesanthurai on the eve of the polls. The Eelam Peoples Democratic Party which supported the UNP has been declared to have won nine seats in the Jaffna area. The Tamil United Liberation Front which did not support the Alliance won five seats and the Democratic Peoples Liberation Front four.

Soon after the results were known there was some speculation as to whether the president may not use his wide-ranging powers to avoid inviting Kumaratunga to form the government. While the president does have the right to pick the leader of his choice, and not necessarily the person who has been named leader by the party capturing the largest votes in the proportional representation system, the overwhelming show of support for Kumaratunga, indicated by the 4.6 lakh preference votes she polled in Gampaha district (as against the former prime minister's 2.91 lakh in Colombo district) could not be overlooked. The president can dissolve the parliament after a year of its existence. This still means that the presidential elections, which have already been announced for November, will be held under the auspices of the PA.

The alliance in its manifesto had promised constitutional reforms directed at making parliament the supreme political authority. The PA has proposed the converting of the parliament to a constituent assembly for this purpose. But before doing that it will have to revoke the announcement on the presidential elections.

The other issue which the alliance has promised is the reorganisation of the provinces. The LTTE has demanded the permanent merger of the north and the north-east, which the UNP and some Sinhala groups see as a first step towards secession. While the PA has not accepted any conditions on this, it is not seen as being averse to granting the LTTE demand in the interest of a possible resolution of the conflict. But clearly the LTTE has seen the importance of publicly welcoming the victory of PA. This is a positive first step, and the prime minister has also acknowledged the urgency of initiating a dialogue with the 'Tigers', as she has referred to them, by retaining the internal security portfolio along with finance. Moreover, by appointing as foreign minister a Tamil known to be pro-India, she has also sent signals for a different kind of rapprochement with the Sri Lankan Tamils in the north.

However, Kumaratunga and her government face a tough time ahead in which a crucial factor will be her ability to keep the Alliance functioning cohesively.

Mideast Integrated

PROMOTED by Mideast (India) which is the flagship company of the MESCO group of companies, Mideast Integrated Steels is setting up a 100 per cent export-oriented unit to manufacture foundry grade iron with an installed capacity of 4,64,000 tpa. The project is the first Indo-Chinese joint venture in the steel sector in financial-cum-technical collaboration with China Metallurgical Import and Export Corporation (CMIEC) and will be using state of the art Chinese technology resulting in lower overall raw material consumption and one of the highest production levels of hot metal of two tonnes/m^3/day (which has been guaranteed by CMIEC). The company also plans to set up a 4 mw power plant and sinter plant which would run utilising waste gases generated from the blast furnace. The project which is being set up at a total cost of Rs 307 crore is to be located in close proximity to iron ore mines, port and infrastructural facilities with rail and road facilities running adjacent to the plant. It will be financed through equity capital of Rs 135.75 crore (Rs 69.1 crore from promoters and the balance through a public issue) and rupee term loans from financial institutions aggregating Rs 171.25 crore. The company's public issue will consist of 3,33,25,000 equity shares of Rs 10 each at a premium of Rs 10 per share and will open for subscription on September 8. The issue is to be lead managed by IDBI, IFCI and ITC Classic Finance.

Kedia Chemical Indus

Kedia Chemical Industries which is engaged in the manufacture of organic chemicals, pesticide intermediates and organic intermediates is now planning to broad base its area of operation by setting up a plant for the manufacture of technical grade pesticide and pesticide intermediate. The plant which will be located at the existing location of the company, namely, MIDC, Thane Belapur Road, and will be a multipurpose plant with capability to manufacture technical pesticides chlorpyriphos/acephate in addition to the capacities of 100 tpa for cypermetherin and 350 tpa of trichloro acetyl chloride. The project, which is to be set up at a total cost of Rs 5.8 crore, is to be part financed through a public issue of 17,00,000 equity shares of Rs 10 each at a premium of Rs 20 per share. IDBI, which has appraised the project, has sanctioned a term loan of Rs 2 crore. Commercial production is expected to commence by December 1994 and the company plans to market its new products to industrial users and a large number of formulators all over the country. The issue which will open for public subscription in the third week of September will be lead managed by SBI Capital Markets and Ind Global Financial Trust.

Hind Ind Chemicals

Hindustan Industrial Chemicals (HIC), a company engaged in trading in chemicals and other industrial products, has been promoted by the Rs 100 crore turnover company, Hindustan Alloys Mfg Co (HAMCO). HIC is now setting up a project for manufacturing hydrogen peroxide and sodium perborate with an installed capacity of 20,000 tpa (50 per cent w/w basis) and 10,000 tpa, respectively. The project is to be set up at a total cost of Rs 71.2 crore and is to be part financed through a public issue of 1,99,50,000 equity shares of Rs 10 each which will be offered at a premium of Rs 7 per share. The total cost of the project, which is expected to commence commercial production by December 1995/January 1996, is to be financed through equity capital of Rs 61.1 crore and equipment lease finance of Rs 10.1 crore. The company's products which are considered to be very versatile, dependable and environmentally desirable oxidising agents and bleaching agents, find application in almost all basic industries like textiles, paper and pulp, chemical, rubber, metallurgical, cosmetics, electronics, pharmaceuticals, etc. The issue will be lead managed by V B Desai Financial Services.

Geoservices (India)

Geoservices, which has been co-promoted by Geoservices Eastern Inc (GEI), Singapore—a part of the Geoservices SA worldwide—and Sahu, is currently engaged in the manufacture of mudlogging equipment and provides mudlogging services to various oil companies in addition to providing technical consultancy to GEI for its operations in India. The company now proposes to diversify through lateral expansion of operations into oil-field services such as bottom hole sampling and reservoir studies, production testing services and sub-sea test tree services, drill stem test services, production logging, horizontal drilling and mwd services, early production facility, DMS and technical consultancy services. Geoservices expects to commence its new activities by November this year when the tenders for the same are floated by the new oil companies. It has a technical collaboration agreement with GEI which will have a 25 per cent stake in the company's post-issue equity capital. Further, Geoservices is eligible for a 15 per cent price preference in ONGC/OIL contracts. The project is expected to cost Rs 4.5 crore and is to be part financed through a public issue of 32,20,000 equity shares of Rs 10 each at par. The issue which will be lead managed by Indbank Merchant Banking Services will open for subscription on September 1.

The data for the latest fortnight suggest that M3 growth has started accelerating in the current fiscal year, despite reduction in net RBI credit to the centre as also in net bank credit to the government. Bank deposits as well as non-food advances have grown at a faster rate. In the share market, though equity prices have reacted somewhat from the peak reached in the previous week, their levels still remain high. In the external sector, though the trade-weighted exchange rate in real terms for March 1994 shows a rise over the previous March, it still remains 16 per cent below the level prior to the July 1991 two-step devaluation. While the rate of foreign investment approvals in terms of amount has decelerated, the actual inflow seems to have picked up; so have foreign exchange earnings through tourism.

Macroeconomic Indicators

SHREE RAJASTHAN SYNTEX

Upgrading Technology

SHREE RAJASTHAN SYNTEX, which is engaged in the manufacture of polyester/viscose blended and acrylic yarn and polypropylene multi-filament yarn, improved its perfomance in 1992-93. The company saw a 35 per cent rise in net sales and a more than 100 per cent rise in operating profit during the year. A sharp rise in interest (up 177 per cent) and depreciation charges (up 178 per cent) however diluted somewhat the sharp rise in operating profit. With the company producing innovative varieties of high value dyed fancy yarns which were well received in the market, production of spun yarn improved from 4,611 mt to 4,965 mt while sale in volume terms was higher at 4,946 mt as against 4,485 mt sold last year. Sale realisation on the same also improved significantly from Rs 54.7 crore last year to Rs 68.8 crore. Following the successful implementation of its filament yarn project in September 1992 (without any cost overrun) the company produced 790 mt of polypropylene multi-filament yarn during the year. With the division's product being well received in the domestic as well in the international market the company has also commenced exports to the European and far eastern markets.

Encouraged by its performance the company is now adding another 7,200 spindles at its spun yarn division at Dungarpur, taking the total installed capacity to 32,400 spindles at an estimated cost of Rs 10 crore. A part of the project, which was being implemented with technical support from NEUMAG of Germany, was implemented in Septemeber 1993 and the balance was expected to be completed by the end of December 1993. With a view to keeping in line with the latest technology, the company has been regularly updating its machinery. It recently installed a modern autoconing machine, two for one twisters and electronic yarn cleaners. Further it is installing additional machines at its filament yarn division in order to enhance production by about 30 per cent.

For the year ended June 1994 the company has reported a significantly improved performance earning a net profit of Rs 7.4 crore (up 100 per cent) on a net sales of Rs 102.9 crore (up 50 per cent).

PIRAMAL SPINNING

Modernisation Programme

After earning a net profit of Rs 4.5 crore on a net sale of Rs 52.8 crore in 1990-91, Piramal Spinning and Weaving Mills (PSWM) has seen a continuous fall in its profitability over the last two years. Its net profit margin has deteriorated from 8.8 per cent in 1990-91 to 3.9 per cent in the following year. For the year ended March 1993 the company has actually suffered a net loss of Rs 5.4 crore on a net sale of Rs 63 crore. The high cotton prices prevailing coupled with the severe competition from independent process houses and composite mills affected the company's performance adversely. Sale fell from 279.5 lakh metres of cloth and 8.7 lakh kgs of yarn last year to 261.5 lakh metres and 7.2 lakh kgs, respectively.

The company's exports also fell drastically during the year from Rs 5.5 crore to a mere Rs 1.6 crore. With the company changing its product mix from the local market to exports and readymade garments, quality has become a major concern. With a view to improving its product quality the company is implementing a modernisation programme, the fifth phase of which is currently under progress with machinery worth Rs 3.3 crore having been purchased and orders for another Rs 2 crore being placed. To part finance the latest phase of the modernisation project the company entered the capital market with an issue of 8,62,650, 17 per cent secured partly convertible debentures (PCDs) of Rs 100 during the year. With the conversion of part 'A' of these debentures into equity shares of Rs 10 each at a premium of Rs 40 per share, the company's equity capital has risen to Rs 2.8 crore. With this, the company's debt-equity ratio, which had risen sharply with the issue of PCDs, has once again come down.

The energy conservation measures undertaken by the company include installation of power saving units for lighting, replacement of conventional electric chokes by electronic chokes (under progress) and replacement of conventional spindle oil lubricants by synthetic lubricants. The company was the recipient of the first prize in 1990-91 and the second prize in 1988-89 in the Composite Mills Category instituted by IBPL Urja Research Foundation.

Meanwhile the company has managed a turnaround in 1993-94. On a higher net sales of Rs 77.1 crore the company earned a net profit of Rs 3.7 crore giving an earning per share of Rs 13 on its low equity capital.

JYOTI

Demand Recession

A BIFR case until recently, Baroda-based Jyoti (JL), is a major manufacturer of a wide variety of electrical equipment and engineering products which include electric motors, heavy and low tension a[illegible]rs, pumps, switchgears and diesel generators. The company saw a 19 per cent rise in its operating profit on a 11 per cent rise in net sales during 1992-93. The demand recession in the capital goods industry due to the tight liquidity position of most of the electricity boards and central and state governments, who are the major customers of the company, forced it to settle its outstandings over longer periods. Further, customers who had earlier placed firm order with the company began requesting deferment of deliveries due to the liquidity crunch. The company claims that but for the non-availability of working capital from banks its performance would have been much better. Exports (including deemed exports) were higher by 15 per cent over the previous year.

During the year under review the company successfully tested a 6.6 kv phase segregated terminal box for a fault level of 500 mva at CPRI laboratory in Bangalore in addition to successfully testing an electronic governor. It now plans to take up production of the governors and this is expected to result in significant savings in foreign exchange.

The company's order book position stood at Rs 65.5 crore at the beginning of 1993-94 (including Rs 60.8 crore worth of orders booked during the year under review) which included major orders such as for 6.6 kv vcb panels valued at Rs 4.7 crore for the hot rolled coils project of Essar Gujarat at Hazira; 11 kv outdoor vacuum circuit-breakers valued at Rs 3 crore for various sub-stations of the Andhra State Electricity Board; 11 kv and 6.6 kv vacuum circuit-breaker panels valued at Rs 1.6 crore for the Gandhar Crude Oil Processing facility of ONGC; 120 kva and 150 kva arno converters valued at Rs 2.2 crore for the Chittaranjan Locomotive Works; pumping station contract valued at Rs 1 6 crore from BSES for its Dahanu thermal power station; and a pumping station contract valued at Rs 2.3 crore from the Municipal Corporation of New Delhi for their clear water pumping station at Nangloi.

For the year ended March the company earned a net profit of Rs 3.4 crore on net sale of Rs 72.1 crore.

PREMIER INDUSTRIES

Lower Profit

Incorporated in 1973, Premier Industries is engaged in the manufacture of solvent oils, oil cakes and oil sludge. Though the company's net sales in 1992-93 increased significantly by more than 70 per cent over that in 1991-92, profitability suffered with operating profit falling by 6.4 per cent and net profit falling by more than 50 per cent

over the same period. This was due to lower realisation on the company's products as also due to the sharp rise in manufacturing expenses.

With the successful implementation of its modernisation-cum-expansion project for edible oil, production at the solvent division during the year was higher at 4,876 mt of oil as against 3,549 mt produced last year. Production of deoiled cakes/powder and soap and oil sludge was also higher at 24,793 mt and 404 mt, respectively, as against 18,798 mt and 8 mt in the previous year. Sale was also higher in volume terms at 12,902 mt (3,549 mt) of solvent/refined oil, 36,955 mt (18,798 mt) of deoiled cakes/powder and 343 mt (56 mt) of soap and oil sludge. The dairy milk division, which markets its products under the brand names 'Manthan' and 'Dewa', produced 1,310 mt (1,226 mt) of skimmed milk powder, 1,121 mt (808 mt) of pure ghee in addition to producing 125 mt of skimmed milk powder on job work basis. Sale also improved in volume terms to 1,378 mt (1,226 mt) of skimmed milk powder and 1,096 mt (808 mt) of pure ghee. Despite higher production from these two divisions, the company's soya milk division could not undertake commercial production due to the absence of demand. The company's exports meanwhile improved by 51 per cent over the previous year to Rs 19.9 crore accounting for 29.6 per cent of net sales.

With the completion of modernisation of the refinery the company planned to manufacture various value added products. Further, with the commissioning of the lecithin plant, this was also expected to contribute to sales in 1993-94. With the market responding favourably to its latest introduction of pasteurised and toned milk, the company also started marketing its products (ghee and skimmed milk powder) in Rajasthan and Orissa. It plans to enter new market areas.

During 1992-93, in order to finance its lecithin plant as also to meet its working capital requirements, the company entered the capital market with a rights issue of 9,71,113 equity shares of Rs 10 each at a premium of Rs 20 per share. With this issue the company's paid-up capital has moved up from Rs 3.7 crore to Rs 4.9 crore.

Meanwhile, for the year ended March 1994, the company earned a net profit of Rs 1.1 crore on a net sale of Rs 70.1 crore.

BHAGYANAGAR METALS

Reduced Margins

The recessionary trends in the copper and electrical industry seems to have taken their toll of the performance of Bhagyanagar Metals. The company has three divisions, namely, a copper division and a super enamelled copper wire division (both in Hyderabad) and a PVC foam leather division, and it is now setting up a jelly filled telecommunication cables (JFTC) division. Though the company managed to improve its net sales, albeit marginally, its margins fell drastically during 1992-93. Severe competition affected the jointing kit division and turnover from the division was stagnant at Rs 19.4 crore. Production and sale of copper wire was also lower at 2,378 mt and 1,537 mt, respectively, as against 4,878 mt and 1,949 mt produced and sold last year. Production and sale of super enamelled copper (SEC) wire on the other hand improved significantly from 731 mt and 681 mt, respectively, to 1,235 mt and 1,102 mt. Further, from a contribution of around 25 per cent of net sales in 1991-92, turnover of SEC wires accounted for 40 per cent of sales in 1992-93. Meanwhile the company's imports, which accounted for 34 per cent of net sales, fell by 41.4 per cent during the year leading to lower foreign exchange outgo. This was made possible mainly by reduction in the share of imports in total raw material consumed from 73.5 per cent to 57 per cent.

The company has undertaken a project for JFTCs with an installed capacity of 6 lakh ckm at a total cost of Rs 26 crore. The project, which was in an advanced stage with civil works already completed and most of the items of plant and machinery under erection, was expected to commence production in the current calendar year. The project is actually a forward integration for the company with almost 60 per cent of raw material requirement available from group companies and its own units.

In line with its efforts to save energy, the company has improved insulation of its furnaces by replacing the old one with glass wool which is the latest in insulation technology. It has developed a new machine which can run up to three different sizes of wire in the same oven thus reducing the set-up and the changeover time. This has resulted in reduction in scrap leading to increased efficiency. The company has also developed and supplied a special grade of enamelled wire to ISRO which was used in INSAT 2B. It is now developing enamelled strips and fibre glass covered strips which will be used by the railways and for special purpose motors.

For the year ended March 1994, on an improved turnover of Rs 62.6 crore the company earned a net profit of Rs 2.2 crore.

National Population Policy

Progression towards a Fascist State

Arun Ghosh

The draft Population Policy deserves to be rejected because (i) it will result in unconscionable centralisation of authority, (ii) its proposals are heavily biased against women, and (iii) some of the procedures and means recommended are little short of fascistic

A HIGH-LEVEL group of experts (GOE hereafter), set up by the government of India in July 1993 to prepare a draft National Population Policy has submitted its report in May 1994. Like all government committee reports it has been quite hush-hush, its recommendations veiled in secrecy, and reportedly currently under the consideration of the union cabinet.

There are two frightening aspects of the report of the GOE: first, the members are men and women of impeccable credentials, and second, the final recommendations—apparently not even seen by some members (or inadvertently not properly read by some others)—are fascistic in approach. These are strong words but it is important to point out some of the clear directions of policy approach implicit in the recommendations of the GOE. If implemented, the new Population Policy of the central government would lead to enormous centralisation of political and economic authority; the policy recommended—despite many sweet invocations in favour of women—is anti-women in the extreme, and the powers recommended for the central authority (and the means of policy implementation recommended) are so obviously fascistic (and so reminiscent of the days of 1975 and 1976 and again, of 1981-82-83) that one begins to wonder whether the members of the GOE believe in Aldous Huxley's *Brave New World* as perhaps the manner in which to fashion societal development in the future.

Since the members of the GOE are all eminent personalities, no names should be taken but one cannot help taking the name of the chairman, a man of international eminence in the person of M S Swaminathan, and the name of one member, Devaki Jain who is supposed to have signed the report (since the letter of transmittal gives the names of all members, with the statement that "*We* (emphasis added) hope that the draft population policy statement will help to stimulate debate and discussions ...")—but who has, in a public statement issued in July, denounced the draft policy, adding that she could not attend the last two meetings and that "I am not a signatory to the final report of the group".

Two initial points should be made at this juncture. First, since Swaminathan's letter of transmittal expressly indicates the GOE's "hope that the draft population policy statement will help to stimulate debate and discussions ...", it is imperative that government *publish* the document and invite a public debate before the draft Population Policy is considered by the union cabinet. Undoubtedly, there are many useful recommendations in the report of the GOE. But, and this second point is important, one must as of today oppose the draft Population Policy strenuously for the reasons already indicated: the proposals, if implemented, would lead to unconscionable centralisation of authority; the proposals are heavily biased against women (despite many palliative gender conscious sentences), and some of the procedures and means recommended are nothing short of fascistic.

There can, therefore, be no compromise: the GOE report should be published and debated and thereafter hopefully consigned to the waste paper basket where it belongs. One could then pick up the (many) elements which are worthy of consideration which could then be debated, and possibly implemented.

Fascistic Measures

Let us discuss the three major implications of the draft Population Policy in reverse order. Why do I deem the recommendations of the GOE to be fascistic? Two specific recommendations of the GOE in Part B of the report dealing with implementation should be reproduced here—unfortunately necessarily out of context, but nevertheless, as indicative of the mental make up of the GOE.

> Battalions of the Indian army which are involved in helping to overcome environmental degradation in several parts of the country may be deployed wherever feasible to serve the cause of health and population stabilisation.

Well, well: the civil government has, of late, been increasingly dependent on the armed forces for action in areas where civil institutions should do the job, and regrettably, we have seen not only the civil administration but also—and increasingly—the civic authorities crumble. But the issue here is clear. Do we totally give up on the institutions of civil society or do we try to refashion them? This is a very broad area of discourse, and we may pick up the threads again, in the context of problem one, namely, the over centralisation implicit in the draft Population Policy. At this juncture it need only be briefly stated that the very thought of using the armed force, for purposes such as promoting a positive policy reveals an authoritarian mind set, not only that, the impact of the implementation of such a policy on the recipients of the 'message' is likely to be wholly counterproductive. Indeed, it is surprising that the members of the GOE have taken no lessons from the experience of developed countries, from the experience of Kerala within our own country in regard to the intimate causal relationship between the gross reproduction rate and factors such as infant mortality rate (IMR), pre natal maternity care, proper sanitation and maternity care, post natal maternity and infant care, health and nutrition of children et al. Similar trends are now beginning to appear in Tamil Nadu. In Punjab the increased income of the farm population has led to a dramatic reduction in the net reproduction rate in recent years and in none of the three states mentioned above have coercive measures been used. Indeed if the experience of past coercive measures is any guide, the effect of such measures is generally counterproductive.

The other quotation in this context is indicative of a viewpoint which is not objectionable *per se* but evidence of extreme naivete.

> Youth organisations like NCC, NSS, Scouts and Guides will be harnessed for activities related to population and social development.

The possible role of youth in *social development* is indisputable but the use of children—how else does one categorise Scouts and Girl Guides?—for propagating population control measures is at best ludicrous. Somehow each one of us when we are working on a narrow field of our specialisation seems to think that every possible means should be adopted to achieve the desired objective. We forget that the objective may be sound but the means recommended for its attainment may not even be appropriate. In fact the suggestion concerning the use of the NCC sounds like the use of para military forces for the

propagation of population control and reflects a somewhat unthinking mind-set. Anyhow, one would have expected the highly reputed members of the GOE to show greater concern as to the *means* of achieving population control. There is no dispute about the objective; there would be universal agreement thereon. Equally, because the issue is important, one would have expected greater introspection, greater use of past experience around the world, as to the means to be adopted for achieving the desired objective.

Anti-Woman Bias

How is the proposed new Population Policy anti-women? Again, in the context of the implementation of the proposed policy, it is stated that "today women bear the brunt of sterilisation operations"; but in the very next paragraph the GOE goes on to say "...there are now the newer hormonal methods which women can use for spacing". Further, "it has to be recognised that no medication... is completely free from side-effects"..."but India has an efficient scientific set-up for testing for safety, effectiveness, reliability, and acceptability of contraceptive methods..."

What are the facts? A large number of activist women's organisations are reported to have protested to the government against the introduction, in India, without adequate trial—and certainly without certification by the concerned authorities in India—of oral and injectable contraceptives (imported from the US) for women. One of them is Cyclofem; another is NET-EN; a third is Depo Provera. Cyclofem is a combined injection of estrogen and progestogen which will be introduced without trials in India.

Some of us are not medical experts, nor even scientists; but two points need to be made. First, despite all manner of platitudes like the burden of family planning being equally shared between men and women, *in practice* what is being put into place are hormonal injectables (and oral pills) for women. Secondly, injectables can be given to women without their knowledge and consent; and in a male-dominated society, with the armed forces, paramilitary forces and 'skinheads' (in the NCC/NSS) being drafted to mobilise support for limiting the size of family, and with increasing centralisation of authority, where is the guarantee that the country would not be a witness to large-scale application of injectable family limitation techniques on women without their knowledge and consent?

Indeed, there are certain aspects to this policy which have to be seen in the light of the steady reduction in government involvement in primary health care facilities and in the assiduous promotion of 'market driven' education and health services. Policy intent and action appear to be increasingly drifting apart, in every area of social and economic development.

Centralisation of Power

Let us get back to the very first of the objections raised earlier, namely, the over-centralisation of economic power that is envisaged in the report of the GOE. Indeed, the report does pay homilies to decentralisation; it goes on to claim that the proposed "Population Policy is structured on the basic premise: think, plan and act locally and support nationally". As part of the preamble, the report goes on to say, "the decline in the sex ratio (the ratio of females to males in the population) is a warning signal". The warning signal pertains to social attitudes, to innate prejudice against a female child, to the mind-set of the population. The concern of the GOE is well taken. The GOE has also stated that "population, poverty and environmental degradation have close linkages..." (though one could argue that more than the linkage between poverty and environmental degradation, one has to worry about the linkage between environmental pollution and untreated industrial effluents in a 'market driven' economy). Anyhow, what are the recommendations of the GOE? One needs to focus on the main thrust of the new policy which is briefly summed up below.

First, there is to be constituted a new Cabinet Committee on Population and Social Development with the prime minister as the chairperson. Fine, if that is the way to give increased attention to population control and social development. But there will now be constituted a new Population and Social Development Commission (PSDC) "with executive powers such as the Atomic Energy and Space Commissions". If accepted, we would, in one fell swoop as it were, impose

yet another layer on the existing layers-upon-layers of bureaucracy. The PSDC chairman would have the rank of a cabinet minister.

How will the PSPC operate? To begin with, it "will operate the Population and Social Development Fund". The Fund (PSDF) would, in turn, have the following sources of revenue: (a) GOI funds, including the amounts now spent on incentives, (b) bilateral donors, (c) foundations, multilateral donors and UN agencies including UNFPA, (d) corporate and co-operative sectors, and (e) voluntary contributions from both within and outside the country. The GOE report goes on to add: "state governments will make every effort to augment financial, technical and institutional resources", and finally, "suitable tax incentives will be provided for this purpose", the purpose being "voluntary contributions to the Fund".

We would come to the organisation and activities of the PSDC later; but one point is crystal clear. There will now be a mammoth new Centrally Sponsored Scheme—with bilateral and multilateral foreign aid—in the guise of a new Population Policy. And, when the centre provides "tax incentives... [for] voluntary contributions to the Fund", essentially, the centre is dipping into the kitty of statutory transfers of central tax collections (of both corporate and individual income-tax) to the states. It is easy for the centre to be generous on this score, for the centre keeps its tax collection cost; and some 85 per cent of the *net* tax revenue is to be shared with the state governments.

Lip-Service to Decentralisation

Add the burden imposed on the extremely meagre resources of the state governments in relation to the enormous development problems which, under the Constitution, are the responsibility of the state governments—the *additional* burden imposed on states to find the balancing funds to enable them to take advantage of funds to become available from the PSDF—and you have another clever ploy of increasing the clout and the might of the centre in regard to ordering the lives of the people of this country. Already, the volume of transfers from the centre to the states, under Centrally Sponsored Schemes, exceeds Rs 6,000 crore (for which the states need to make some matching contribution). Already, the financial resources of the state governments are strained to a point where essential services are badly neglected, by way of maintenance of roads, bridges, expenditure on education and health, provision of other infrastructure (like power, irrigation). We now have yet another programme—potentially, a mammoth one—wherein funding would depend on the states' contribution.

Let us face it: the talk of decentralisation is merely paying lip-service to the concept. it is not backed by any concrete, positive movement towards effective decentralisation. This becomes glaringly obvious when one goes into how the PSDC would function. In the first place, the PSDC is to be an *executive authority* (on the lines of the nuclear and space agencies). It is to have its own (large) corpus of funds. It would be responsible for not only formulation of policies but also of their implementation, monitoring and evaluation. One knows from experience that one who pays the piper calls the tune. The PSDC would be the focal point of receipt of all foreign funds—apart from substantial domestic resources—and a large part of the centralised funding would be at the expense of resources that would otherwise have accrued to state governments. Not only would the existing personnel of the Department of Family Welfare be transferred to the PSDC, but according to the GOE report, "additional staff, particularly specialist consultants, will be required by PSDC..." More frighteningly, the "PSDC will prepare a socio-demographic charter for the country as a whole..."

There are some very pious statements made by the GOE. One may cite only one instance, "state governments will make every effort to augment financial, technical and institutional resources". How this will be done is, of course, not the concern of the GOE.

Perhaps an important constitutional issue needs to be raised here. The PSDC would operate the PSDF. The 'Fund' would comprise not only some part of the present central budgetary allocations (in favour of the Department of Family Welfare), the underlying idea appears to be that the Fund would be the focal point of receipt of external assistance as well as internal donations. As such, the Fund would—so it appears—no longer be subject to parliamentary scrutiny. A large corpus of resources is to be placed hereafter at the disposal of the central government (or an agency thereof) without any direct accountability to parliament.

No one, I repeat no one, minimises the importance of limitation of population growth, of steps necessary for universal acceptance by all Indians of a small size of family (of two children as the norm, and of three children as the outside limit). Any number of studies pertaining to experience in different parts of the country have pointed out the close linkages between family incomes and the size of the family and between education, health, maternity and infant care on the one hand and the size of family on the other. A recent study conducted by the Centre for Research in Rural and Industrial Development (CRRID), Chandigarh, has made a sample survey of eight districts in Haryana, Himachal Pradesh and the UP and has concluded that the education of women, employment of women and empowerment of women is the greatest need today in bringing down the reproduction rate in the country. The CRRID study has numerous other findings, but these are generally in line with numerous other studies made by social science researchers in the past. And there is a plethora of such research studies, very few of which appear to inform the findings and recommendations of the GOE. This is not only surprising but also disconcerting. The Group of Experts are all eminent personages, all eminent in their own fields of specialisation, some of them specifically in regard to population studies. Is it possible that they were bulldozed into quickly signing a report they had not studied carefully? Anyone with some experience of the functioning of government committees knows that the draft report is prepared by the member-secretary and is generally overseen by the chairman, the other members playing, by and large, a passive role. One member of the GOE has already dissociated herself from the report in quite categorical terms. A number of women's organisations have reportedly represented against some of the findings and recommendations of the GOE to the chairman. This much is common knowledge.

But no one has so far pointed out that the draft Population Policy—as formulated by the GOE—is clearly and unmistakably an attempt to centralise more powers. Lip-service has been paid to the idea of decentralisation. There is talk of motivating the panchayats. But what can the panchayats—or any other local authority—do when there is to be a fearful concentration of both funds and of powers with the PSDC? The GOE report talks of a 'holistic' approach to the problem of population control. Such an approach should imply total devolution of authority and finances for local level development—of education, health, employment, incomes of all in general and of women in particular—not an 'unholy' concentration of power as envisaged today, with clear directions as to coercive measures that may get to be employed through the armed forces, the NCC, et al.

The country needs to *reject* such an approach, in the same unequivocal manner as it rejected the 'Emergency' in 1977.

Leastwise, the country should demand the publication of the GOE report so that it can be debated. Even at the cost of repetition it needs to be stated decisively that: (a) there is undoubted need for stemming the rate of growth of the population, (b) there are some obviously useful suggestions in the GOE report, and (c) overall, the recommendations of the GOE should be dissected carefully, in regard to the implications thereof, and rejected insofar as the proposed Population Policy is an undisguised attempt to centralise powers and authority, when the crying need of the country is greater devolution and decentralisation.

Forestry Debate and Draft Forest Act

Who Wins, Who Loses?

Ramachandra Guha

A careful reading of the government's draft new forest act, to replace the Indian Forest Act of 1927, shows that its real aims are (i) to restrict people's rights in reserved forests, which are owned and managed by the state; and (ii) to sharply limit the area or extent of village forests in which local communities could exercise more effective and independent control.

I

IN the global history of natural resource management, there are few institutions as significant as the Indian Forest Department. Set up in 1864, it now controls over one-fifth of the country's land area. Not only is the Forest Department India's biggest landlord, it has the power to affect the life of practically every citizen. In what is still a biomass-based economy, all segments of Indian society—peasants, tribals, pastoralists, slum-dwellers and industry—have a heavy dependence on the produce of the forests, as the source of fuel, fodder, construction timber, or raw material for processing.

And yet, in the century and a quarter of its existence, the Forest Department has been a most reviled arm of the Indian state. Through the colonial and post-colonial periods, popular opposition to the workings of the Forest Department has been both sustained and widespread. Simplifying brutally, one might say that underlying these varied protests have been two central ideas: that state control over woodland (as opposed to local community control) is illegitimate; and that the Forest Department's programmes of commercial timber harvesting have seriously undermined local subsistence economies.

Popular protest movements in defence of forest rights go right back to the inception of state forestry but curiously a public debate on the direction of forest policy is of quite recent provenance. A comparison might be made here with peasant struggles with respect to land rights and movements of industrial workers with respect to wages and work conditions. At least from the 1920s, the rights of cultivators and factory workers had figured high on the agenda of the national movement. Again, since independence, political parties of left and right have cultivated unions of workers and peasants, while a variety of new laws and policy initiatives have tried, admittedly with mixed success, to safeguard their rights.

By contrast, it is only from the early 70s that intellectuals and activists have picked up, in any serious fashion, the long-standing grievances of forest-dependent communities. However, in the last two decades the working of the Forest Department has come under close and critical scrutiny. It has been demonstrated that state policies have excluded the majority of the Indian population, namely, tribals and peasants, from its workings while favouring the interests of a select group of industrial and urban consumers. Nor are groups working with tribals and other forest-dependent communities the only critics of the Forest Department. Conservationists, for instance, have argued that commercial forestry has contributed significantly to the decimation of biological diversity and to an increase in soil erosion and floods. More recently, industrialists who have hitherto been the prime beneficiaries of forest policy have hit out at the department's selective phasing out of subsidies granted to them, urging that they continue to be given preferential treatment in the supply of forest produce. Faced with sharp criticisms from several quarters, senior forest officials insist that they are unjustly being made scapegoats, while the real causes of forest destruction—in their view, exploding human and cattle populations—escape identification.

In this ongoing debate on the direction of forest management, it is possible to identify four key actors. These might be characterised as *wildlife conservationists*, *timber harvesters* or industrialists, *rural social activists*, and *scientific foresters* respectively. These are indeed 'interest groups' in the strict sense of the term: that is, each has a specific claim on the resource under contention, and lobbies actively to defend or promote this interest. What is noteworthy is that in each case, the management proposals advocated by the group seek wider support from a sophisticated theory of resource use in which their own *specific* interests are presented as being congruent with the *general* interests of society as a whole.[1]

Wildlife conservationists are an interest group with an influence on state policy wholly out of proportion to their numbers. While their focus in practice has been on the preservation of unspoilt nature, defenders of the wilderness are prone to advance moral, scientific and philosophical arguments to advance their cause. Although their initial and possibly still dominant impulse is the aesthetic value of wilderness and wild species, conservationists have found strong support from recent biological debates. The theme of biological diversity as an essential component of a direct and indirect, known and yet to be discovered survival value for humanity as well as an emphasis upon the 'intrinsic' rights of non-human species has been prominent in recent debates on the preservation of wilderness areas. The quite specific interests of nature lovers in the preservation of wilderness are thus submerged in the philosophy of 'biocentricism', which calls for strong action by human beings on behalf of other species.

These philosophical claims notwithstanding, in India a select group of ex-hunters and naturalists has been in the forefront of wilderness conservation. Their concern has been overwhelmingly with the protection of endangered species of large mammals such as the tiger, rhinoceros, and elephant. Their influence is manifest in the massive network of parks and sanctuaries, many of which are oriented around the protection of a single species, such as the 18 parks under Project Tiger. Wildlife conservationists share, with senior bureaucrats in particular, a similar educational and cultural background, and this proximity has in no small way influenced the designation and management of wildland. But for all their talk of the rights of 'non-human nature', most conservationists have been deeply insensitive to the rights of villagers displaced by national parks or whose access to forest produce has been curtailed by their constitution.

The second important group in the Indian forestry debate consists of those who view the forest as a source of industrial raw material. In terms of their management preferences, *timber harvesters* are the polar opposite of wilderness purists. While the latter stand for a 'hands off' management style, which implies the minimum possible interference with nature and natural processes, industrial exploitation of the forest often leads to a substantial and even irreversible modification of the ecosystem.

The industrial view of nature is simply instrumental. For the timber harvester, the forest is but a source of raw material for his factory. But the pursuit of profit dictates a pragmatic and flexible attitude towards forest management. Thus in the past, industrialists had been content with letting the state manage forests, so long as they were assured abundant raw material at rock-bottom prices. But now, with increasing deforestation and the withdrawal of subsidies, paper, plywood and rayon factories have begun to intensively lobby for the release of degraded forest lands for their exclusive use, as 'captive plantations'. Notably, in response to the environmentalist challenge of the last two decades, some industrialists have been quick to develop their own general theory of resource use. In arguing that they must continue to have first claim to the produce of public lands, they invoke the equation in conventional development thinking of industrial growth with progress and prosperity. At the same time, timber harvesters claim that the allotment of land to them as captive plantations will significantly lessen the pressure on natural forests (whose destruction in the past, largely at their own hands, they had of course been quite indifferent to).

By *rural social activists* I mean those individuals and groups working with communities who have an acute dependence on the forests for their livelihood. In present-day India this would include communities of hunter-gatherers, swidden agriculturists, pastoralists, artisans, landless labourers and small and medium farmers. A large proportion of the rural population lives close to a biological subsistence margin, and access to fuel, fodder, small timber and non-wood forest produce is critical to their survival and subsistence. Moreover, most Indian villages have stayed on one site for centuries, and the collective consciousness of their inhabitants stretches far back into the past; state usurpation of the forest is from this perspective a comparatively recent phenomenon, and thus resolutely opposed by tribals and peasants who continue to cling tenaciously to traditional conceptions of ownership and use.

These deeprooted animosities are invoked by rural social activists in their polemic against state forest management. Some among them call for a radical reorientation of forest policy, so that it would more directly serve the interests of subsistence peasants, tribals, nomads, and artisans. Others go further in asking for a total state withdrawal from forest areas; these can then revert to the control of village communities, which they believe have the wherewithal to manage these areas sustainably and without friction. These recommendations draw support from a powerful philosophy of agrarian localism, namely, Gandhism. Where Gandhi, the 'Father of the Nation', always gave primacy to rural interests and needs, the policies of independent India are indicted (for the most part, rightly) for being heavily biased in favour of the urban-industrial sector.

We come finally to the group in actual territorial control of forests and wilderness areas. The brief of the Forest Department might be defined as the adjudication, in an ostensibly scientific and objective manner, of the competing claims of the three interest groups dealt with above. Historically (that is, in the late 19th century, when their profession emerged), *scientific foresters* saw themselves as heralding the transition from *laissez faire* to state-directed capitalism, in which they were, along with other professional groups, the leading edge of economic development. Conservation has been for them the 'Gospel of Efficiency', with scientific expertise and state control its prerequisites. These ideological claims notwithstanding, foresters have often tended to act in a narrow self-interest; holding on hard to control over forest land and the discretionary power that goes with it. It must also be said that, whether at their own initiative or at the behest of their political masters, in practice the Indian Forest Department has consistently put industrial exploitation ahead of both ecological integrity and the rights of local communities.

In this manner, through the skilful submergence of specific interests in a general theory of the human (and natural) good, these competing groups have tried to legitimise their claims on forests and forest produce. The territorial aspirations of foresters are accompanied by claims to monopoly over scientific expertise; the aesthetic longings of nature lovers are legitimised by talk of biological diversity and the ethical responsibility of humans towards other species; the profit motive of capital masquerades as a philosophy of progress and development; and the requirements of tribal and peasant communities are cloaked by an ideology that, in a manner of speaking, opposes country to city and Bharat to India.

Finally, let us note the varying positions on state control over forests and wildland. Two groups are unambiguous in supporting state control, even if they insist that the state enforce only their definitions of forest use. Thus wilderness conservationists see a powerful, interventionist state apparatus as indispensable both in designating wilderness areas and in subsequently keeping out intruders, while for scientific foresters total state control would allow them to plan rationally at a nation-wide level, without having to take account of the views on the subject of the 'non-expert' citizenry. Rural social activists, for their part, are by and large opposed to strict state control, arguing for a greater role to be given to community ownership and management of forests. As for timber harvesters, they are characteristically opportunistic on the question of forest ownership; calling when it suits them for the privatisation of forest land, and when it does not, for the provision of subsidised raw material from state-managed forests.

These four contending groups apart, a fifth category of resource users has also exercised a major influence on the direction of Indian forestry. This consists of the urban upper and middle classes, who constitute a substantial and growing market for a variety of forest produce. Unlike the other actors in the forestry debate, urban consumers, while numbering in the tens of millions, are a somewhat disaggregated group, without a co-ordinated perspective on forest policy. Nonetheless, their demands for plywood, quality furniture and processed non-wood forest produce have powerfully stimulated processes of forest destruction. Ironically, this upper class also comprises the constituency from which wilderness conservationists spring, and to which their arguments are largely addressed. Where the consumption patterns of the urban elite contribute on the one hand to forest destruction, their aesthetic and recreational preferences, on the other hand, help determine the priorities of national park management. Squeezed between these twin processes of destruction and conservation are the vast bulk of the rural population, who have little stake either in commercial forestry or in wilderness areas as they are presently managed.

II

The evolution of state forest policy and its changing orientation over time can best be understood in terms of the competing claims, and relative influence, of the four interest groups identified above. From 1864 to 1972, forest management strategies were markedly biased in favour of commercial and industrial exploitation, with little attention paid to sustainability or to social justice. However, in the last two decades, as the forestry debate has intensified, no clear thrust has emerged, with the state responding selectively to the claims of different interest groups.

The Wildlife Protection Act of 1972, amended and made more stringent in 1991, and the creation of a vast network of strictly protected parks and sanctuaries are initiatives that respond most directly to the arguments of the wildlife conservationists. Likewise, the liberalisation of wood imports, the continuance of industrial exploitation in state forests despite the evidence of the deforestation it has caused, and more recent moves towards the creation of captive

plantations, might all be viewed as evidence of the continuing influence of private industry. As for rural social activists, despite representing a much larger constituency than both conservationists and timber harvesters, they have had, in the past, minimal influence on the direction of forest management. Their call for a decentralised, and democratic, system of forest management has by and large gone unheeded, with one recent and potentially radical exception. This is the programme of 'joint forest management' or JFM. In West Bengal, where it was initiated, JFM has proved to be a dynamic and successful programme, with state and villagers co-operating in protecting and renewing degraded forests over several districts of the state. Thousands of Village Forest Protection Committees have been constituted, which then manage forests in collaboration with the Forest Department.

Picking up on the success of the experiment in West Bengal, the Ministry of Environment and Forests in New Delhi wrote in June 1990 to the Forest Secretaries of all States and Union Territories, asking them to actively involve village communities and voluntary associations in the regeneration of degraded forest lands. Following this circular, ministry officials prevailed upon 15 state governments to pass orders allowing for the involvement of villagers in the management of degraded forests controlled by the Forest Department. However, progress on JFM outside West Bengal has thus far been slow. For one thing, there has been resistance from the bureaucracy; for another, insufficient attention has been paid to the need to refine the concept to allow for regional variations in economy and political culture. However, the government orders are in themselves a valuable step forward. They constitute an official acknowledgement that a prime reason behind the reckless denudation of government forests in the past was the failure of the Forest Department to work in co-operation with village communities rather than in opposition to them. In theory, and potentially in practice, JFM thus runs counter to the centralising and exclusionary thrust that has otherwise characterised state intervention in forest areas.[2]

Through all this, of course, the fourth group in the forestry debate, the Forest Department itself, has retained most of its powers. The Forest Conservation Act of 1980 (amended in 1988), which makes it much more difficult to convert forest land to non-forest uses without the clearance of the central government, has consolidated its territorial control, as has the Wildlife Protection Act. In West Bengal, the political context might have made forest officials (with the bureaucracy in general) more responsive to pressures from below, but elsewhere in India, state Forest Departments have continued to be indifferent or hostile to the rights of tribals and peasants. Although a few Divisional Forest Officers have responded sympathetically to the programme, there is little question that the Department as a whole has resisted the spread of JFM to other parts of the country (the government orders referred to above, it might be noted, were passed at the urging of energetic IAS officers in the Environment Ministry).

With the forestry debate in a fluid and somewhat unresolved state, the Ministry of Environment and Forests has now drafted a comprehensive new forest act, to replace the existing Indian Forest Act of 1927. This draft, if passed into law, will have profound implications for the direction of forest management in general, and for the rights of forest-dependent communities in particular.

In his comments on the draft act (*EPW*, July 23), Sharad Kulkarni seems to have missed the main import and consequences of the proposed legislation. His 'assessment' of the draft is, if not a 'misassessment', most certainly a mistaken assessment. One reason for this is that Kulkarni's article takes no account of the sociological context, provided by the competing claims and pressures of the four interest groups I have identified as the crucial players in the forestry debate. Another reason is that, taken in by some of the draft's highsounding phrases, he has completely ignored the two central, and dangerous, ideas which underpin the proposed legislation: first, that forest management should in future be guided by the concept of 'carrying capacity', and second, that the centralisation and consolidation of state power is the way to protect and revive India's dwindling forests.

The assessment of the act that follows seeks to redress those omissions. However, my aim is not primarily to correct Kulkarni, but rather to locate and interpret the draft act in the context in which it makes most sense: namely, the claims of our four interest groups. Which of these groups seek to benefit from the bill, and which will be most vulnerable to its provisions?

The Act recently drafted by the Ministry of Environment and Forests is to be called 'The Conservation of Forests and Natural Ecosystems Act'. As the very title indicates, there is to be a strong, perhaps even dominant, emphasis on conservation and environmental protection. The detailed provisions of the act also make it clear that its intention is to create or maintain reserved forests under strict state control, for preserving the ecological balance. Thus in comparison with the past, there is a relative de-emphasis on industrial wood production from forest areas. 'Sound ecological management' is here held to be the main objective of forest policy, rather than the 'sustained-yield forestry' which was the guiding principle previously. ('Sustained-yield' was but a euphemism for industrial exploitation, which was in practice environmentally destructive and quite unsustainable in the long run.) Again, Section 40.A1 of this draft provides that state governments have to get the permission of the central government before entering into any agreement for supplying raw materials to industry.

This ecological emphasis also lies behind the checks on further encroachment or diversion of forest land. Sections 5 and 34 prohibit the state governments from granting *pattas* or occupancy rights to those who are unauthorised encroachers on reserved or protected forests, without the permission of the centre. Likewise, the central government can give directions to any state government (*cf* Sections 3(2) and 27A) to constitute reserved forests in a specific area and ensure that these instructions are carried out.

This ecological focus is a distinctive feature of the proposed act. However, it is combined with a more traditional emphasis on state control over forest areas. We have here a very state-oriented piece of legislation which *seeks to considerably slow down, and perhaps even reverse, the trend of greater popular participation in forest management*. The explanatory notes say that the new Act's "ultimate objective is either to constitute reserved forests or village forests", in the process gradually doing away with the intermediate category of protected forests. However, a careful reading of the Act shows that its real aims are: (i) to restrict people's rights in reserved forests, which are owned and managed by the state; (ii) to sharply limit the area or extent of village forests in which local communities could exercise more effective and independent control.

Let us take these two aspects in turn. Sections 1.12 and 13(d) state that the exercise of rights in reserved forests, such as the collection of fuel, fodder, etc, can be continued "subject to the carrying capacity of the land in question and prevention of its overuse". And if the land is considered "already degraded", the Forest Settlement Officer can immediately stop the exercise of rights until he is satisfied that the land has been "restored to its potential productive capacity". Again, Section 22A provides that all rights can be commuted, i e, extinguished with a one-time payment, if the government considers this to be necessary for the prevention of "degradation of the said reserved forest". Likewise, Section 76A reserves to the central government the right to make any rules for "rationalising rights, privileges and concessions in respect of forest produce from reserved and protected forests". 'Rationalising' is, of course, only a euphemism for 'extinguishing'.

Now 'carrying capacity' is a concept very difficult to define or implement. The act

itself does not attempt a definition or explanation, perhaps for the reason that no definition is possible. For the notion of carrying capacity depends on so many interrelated factors, such as soil type, climate, patterns of use, past history of forest, etc, that a precise estimation is virtually impossible. However, under this Act a forest officer can arbitrarily decide that the 'carrying capacity' of a particular patch of forest will not permit the exercise of traditional rights, and thus stop access to the area in question. In this manner, a spurious concept such as 'carrying capacity' will be used to deny the legitimate and long-exercised rights of the people.

One aim of the act, then, is to closely monitor, regulate and limit people's rights in reserved forests. Simultaneously the legislation will, in effect, sharply limit the area of village forest in which peasant or tribal communities can exercise real powers of management and use. Page 4 of the explanatory notes to the Act claims that it has "considerably" expanded the chapter on village forests (that is, in comparison with the existing Act) so as to give village-level institutions the powers to "protect or manage forests and to appropriate the forest produce therefrom". This, it says, is in conformity with the emphasis in the National Forest Policy of 1988 on "people's participation in afforestation and protection".

In his *EPW* article referred to above, Sharad Kulkarni is completely taken in by this claim. He says that while "village forests were given little importance in the Act of 1927", the present draft has several provisions relating to their management, thereby underlining their importance. He also believes that as "the government of India is encouraging the practice of joint forest management", it is "therefore, natural that these ideas should find place in the proposed Act". Here he appears not to have read the fine print closely enough, or understood its implications. For in point of fact, in the one respect that matters—*access to land*—the 1927 Act better allowed for the constitution of village forests. Moreover, far from giving expression to the government's support for joint forest management, this act will in practice sharply limit the spread of JFM in all parts of India.

Let me explain. While it is true that the rights and responsibilities of communities that manage village forests have been more carefully spelt out, in actual fact the proposed Act will ensure that *only very limited areas will be available for possible constitution as village forests*. Most crucially, the Act states that village forests cannot be constituted from reserved forests—these can only be carved out of the class of 'protected forests', which all over India are in much poorer condition. This is a truly retrograde step, for in most states the greater proportion of forest land has already been constituted as reserved forests. For India as a whole, reserved forests are almost twice as large in extent as protected forests (at 41.5 million hectares as against 23.3 million hectares), while in several states the relative figures are much more skewed. Thus in Andhra Pradesh the area of reserved forests is roughly four times as much as the area covered by protected forests, in Gujarat thirteen times as much, in Karnataka more than seven times as much, and in Uttar Pradesh a staggering thirty-four times as much.[3] Meanwhile, there is considerable variation within each state, so that there are quite a few districts where virtually all forest land is under reserved forests.

In many parts of the country, therefore, there is little area outside reserved forests, either as protected forests or other common land, that shall be available for the formation of village forests. Moreover, this land will be of infinitely poorer quality. In other words, the Forest Department *has kept the most and best land for themselves, limited people's access to this land, and then allowed them to have very little, already degraded land elsewhere*.

By prohibiting the constitution of village forests from reserved forest land, this new legislation overturns a provision in the existing Indian Forest Act of 1927, wherein village forests can in theory be constituted from reserved forests. That provision has been very rarely exercised in practice, but the fact that it exists shows that at least in this respect, the colonial forest law was actually more sympathetic to people's participation and people's rights than the act now proposed by our independent, 'democratic and socialist' government.

I believe this to be the most dangerous feature of the draft legislation. It must be opposed at all costs, with this provision replaced by one that allows, even facilitates, the conversion of reserved forests to village forests. (A model worthy of emulation here is the Nepal Forest Act of 1993, section 25 of which states boldly that "The District Forest Officer may hand over *any part of a national forest* to a users' group in the form of a community forest".) For if the present provision forbidding the conversion of reserved forests to village forests is retained, it will deliver a body blow to programmes of Joint Forest Management or JFM. In the sal forests of West Bengal where JFM has been most successful, the land allotted for JFM has mainly been ex-zamindari forests that were since converted to protected forests. However, there are many areas, both in and outside West Bengal, where JFM can only spread and succeed if reserved forests are allotted for the constitution and functioning of Village Forest Protection Committees.

This undemocratic aspect of the proposed legislation is further heightened by the provisions that facilitate the conversion of village forests to government-owned forest while totally disallowing the reverse. Thus Section 34(j) allows the state government to take over village forests, while Section 35 provides for the state's acquisition of sacred groves even if these have been protected by villagers for generations. These provisions are in conformity with the general thrust towards centralisation, the consolidation of the powers of government at the expense of the ordinary citizen, that is such a conspicuous feature of this act.

This bias towards centralisation and state monopoly is manifest in other ways. For instance, the state can, if it so chooses, exercise a monopoly on any kind of forest produce, on its trade, transit, sale, etc, "whether such forest produce is grown or found on land owned by the state government or on private land" (Section 40A). Again, individuals cannot open or operate saw mills, but the state government, if it so wishes, can (Secton 40D). In general, the state has reserved to itself all arbitrary and residual powers. Thus forest officers have the powers to arrest without warrant merely on "reasonable suspicion" that someone is committing or might commit a forest offence (Section 64).

With respect to the domain of agro-forestry, too, the act facilitates unnecessary and irksome interference by the state. Here again, there is a wide gap between what the legislation professes and what it enables in practice. It claims it wants to facilitate tree farming, but at the same time it places numerous hurdles in the path of farmers who might actually want to plant trees on their own land. Thus every tree-grower has to be registered with the Forest Department, who must be informed when trees planted and nurtured by the farmers are to be felled or sold. Moreover, the state can specify the spacement of trees planted on farm land. As none of these restrictions operate in the case of other cash crops (such as cotton or sugarcane) they will be a great deterrent to farmers who might otherwise plant trees on their land.

One additional flaw in the proposed legislation is that it discriminates or makes no allowance whatsoever for certain groups or communities which have a critical dependence on forest land or forest produce. For instance, Section 13(3) states that anyone claiming rights in reserved forests must be from a village or town which has a "contiguous boundary with such forest". This discriminates against nomadic pastoralists who may have been grazing their flock, on a seasonal basis, for centuries in the designated forest but whose 'permanent' home is elsewhere. Nor have any provisions been made for the supply of raw material to artisan families who work with wood, bamboo or forest grass.

The act also intends to "regulate, phase out or extinguish" the practice of shifting cultivation on which some tribal groups depend upon for their livelihood.

Legal experts will have to carefully go over many other provisions of the act, for instance those dealing with the powers of forest officials and checks on their abuse, and the various punitive sanctions the act provides for. Here I have highlighted only those features of the draft legislation that have a more general bearing on forest management. To sum up, the proposed act is strongly oriented towards environmental protection and towards enhancing the already great powers of the state machinery. However, it remains quite insensitive to the historic rights of the millions of forest dwellers who have themselves been the victims of flawed and biased forest policies in the past. Indeed, in some respects the present draft uses 'environmental protection' as a cover, or excuse, to further deny the rights of local communities.

is to be planted with fuel and fodder species (though how this will be monitored we are not told).

Thus even as the proposed Forest Act will radically limit the progress of community forestry or JFM, parallel moves are afoot to give forest land on a platter to industry. The biases of the Act in favour of wildlife conservationists and scientific foresters have already been commented upon; and the creation of captive plantations will satisfy timber harvesters. The conclusion is therefore inescapable that recent state initiatives in the forestry sector wish to continue a century-old process of discriminating against the rural and especially tribal poor. It is not difficult to anticipate the consequences, namely, escalating conflict between forest communities and the state.

Those conflicts might yet be alleviated if the present act was redrafted and reworked to allow more for a more participatory system of forest management, in which environmental protection was made harmonious with the claims of social justice. 'Ecology and the People', 'Ecology with the People', should replace the present focus of 'Ecology *versus* the People'. That a healthy forest cover can be brought about only through a close co-operation between the state and village communities was well realised by one of our early nationalist organisatons, the Poona Sarvajanik Sabha. Contesting the colonial forest act of 1878 for its excessive reliance on state control, the Sabha pointed out that the maintenance of forest cover could more easily be brought about by

> taking the Indian villagers into confidence of the Indian government. If the villagers be rewarded and commended for conserving their patches of forest lands, or for making plantations on the same, instead of ejecting them from the forest lands which they possess, or in which they are interested, emulation might be evoked between different villages. Thus more effective conservation and development of forests in India might be secured, and when the villagers have their own patches of forests to attend to government forests might not be molested. Thus the interests of the villagers as well as the government can be secured without causing any unnecessary irritation in the minds of the masses of the Indian population.[5]

More than a century on, these sentiments remain strikingly relevant. For we are yet in search of a truly democratic system of forest management, one founded not on mutual antagonism but on a genuine partnership between state and citizen.

Notes

[I am grateful to Bill Burch, Jeffrey Campbell, Ashwini Chhatre, Keshav Desiraju, Walter Fernandes, Arvind Khare and Ashish Kothari for help of various kinds. A more longstanding debt is to Madhav Gadgil, in collaboration with whom several of these ideas were developed. The responsibility for their presentation remains mine alone.]

1 The identification of these four interest groups, and the presentation of their key ideas, draws upon more than a decade of study and interaction. It is not easy to identify printed sources that authoritatively summarise and present the views of each of these groups. However, for the perspective of the rural social activists, see the essays in Walter Fernandes and Sharad Kulkarni, eds, *Towards a New Forest Policy* (New Delhi: Indian Social Institute, 1983); Peoples Union for Democratic Rights, *Undeclared Civil War: A Critique of the Forest Policy* (New Delhi: PUDR, 1982); and Anil Agarwal and Sunita Narain, *Towards Green Villages* (New Delhi: Centre for Science and Environment, 1989). The other interest groups have not generated a comparable amount of literature, preferring to put forward their case by intensively lobbying the government. However, the Forest Department point of view might be found in J B Lal, *India's Forests. Myth and Reality* (Dehradun: Natraj Publishers, 1989); the industry's viewpoint in Murad Ali Baig, 'India's Forests', pp 15-28 in *Some Aspects of Forestry in India* (Bombay: Centre for Monitoring the Indian Economy, 1982), while the ideology of the wildlife conservationist has been summarised and critiqued in my essay, 'Radical American Environmentalism and Wilderness Preservation: A Third World Critique', *Environmental Ethics*, Spring 1989. Finally, a historical overview of forest policy, legislation and conflict in India is provided in Madhav Gadgil and Ramachandra Guha, *This Fissured Land: An Ecological History of India* (New Delhi: Oxford University Press, 1992), Chapters V to VIII.

2 On JFM, see K C Malhotra and Mark Poffenberger, editors, *Forest Regeneration through Community Protection: the West Bengal Experience* (Calcuta: West Bengal Forest Department, 1989); K C Malhotra, Dehal Deb, M Dutta, T S Vasulu, G Yadav, and M Adhikari, *Role of Non Timber Forest Produce in Village Economy. A Household Survey in Kumbui Range, Midnapore District, West Bengal* (Calcuta: Institute for Biosocial Research and Development, 1991); Society for Promotion of Wastelands Development, *Joint Forest Management Update, 1993* (New Delhi: SPWD, 1993); Madhu Sarin, *From Conflict to Collaboration: Local Institutions in Joint Forest Management* (Working Paper No 14; New Delhi: National Support Group for Joint Forest Management, 1993).

3 A detailed statewise breakdown is provided in Table 1.7 of *The State of Forest Report 1991* (Dehradun: Forest Survey of India, 1991).

4 See the news reports in *The Telegraph*, July 24, 1994, *The Hindu*, July 29, 1994, and *Indian Express*, June 25 and July 29 1994.

Profitable and Socially Responsible Banking

N P Kurup

In its post-scam concern for control and supervision of treasury operations of banks, the Reserve Bank has lost the developmental perspective of nationalised banking.

THE current monetary situation is characterised by excess liquidity and a declining trend in the market rates of interest including for long-term investments. Reports about the rates being offered by banks indicate that the floor rates fixed by RBI have become redundant. Yet, it is also true that the revival of industrial activity is hampered by the high cost and also non-availability of bank credit except for the big top class borrowers who have access to alternative sources of funds and therefore are not in need of bank credit. In this scenario, it also appears that the full beneficial impact of the good monsoon will not be realised for want of bank credit to farmers. This situation calls for urgent corrective action, which is necessary even for the success of the market-oriented reform process.

The annual growth rates of deposits and advances according to population of centres as worked out from RBI's *Quarterly Handout of Banking Statistics* show some interesting features. The metropolitan centres, largely dominated by big business customers, experienced drastic deceleration in deposit growth, from 20.7 per cent in 1992-93 to 14 per cent in 1993-94 despite the excess liquidity with them. These centres also witnessed very drastic deceleration in credit growth, from 22 per cent to 8.8 per cent during the same period. It appears that because of the high rate of interest on short-term funds and also some uncertainty about the availability of resources in the future, companies kept their surplus funds as deposits with banks during 1992-93. But as interest rates on short-term deposits, including CDs, declined substantially, in the context of some assurance of continued availability of funds at lower rates than bank borrowings, the companies used their surplus funds for repaying their borrowings from banks. This seems to explain the unusual phenomenon of high deposit and credit growth in 1992-93 being followed by low deposit growth and still lower credit growth in 1993-94. In brief, the liquidity with the borrowers during 1992-93 was shifted to banks in 1993-94 which had a significant impact on bringing down money market rates.

The other three population groups show a different picture. All the three population groups, individually and collectively, experienced accelerated deposit growth in 1993-94 collectively from 15.3 per cent to 17.6 per cent. But credit growth decelerated, particularly in rural and semi-urban areas. A disaggregated analysis of the data according to regions show that in rural and semi-urban areas, unlike in urban and metro areas, the deceleration was experienced by all the six regions without exception. A further disaggregated analysis (state by population) shows that the deceleration in growth rate was lower in Kerala and Punjab which had traditionally very high repayments (recovery) and lower overdues. This clearly shows that though the recent deceleration in credit growth is frequently referred to as post-scam phenomenon, implying that it is a fall-out of the scam, actually the deceleration in credit growth in rural and semi-rural areas and to some extent in other areas, is a consequence of the implementation of the banking sector reforms, particularly with regard to income recognition, asset classification and provisioning norms.

The reforms are necessary. They were overdue. But in implementing them, the Reserve Bank has shown a lack of perspective about the structure and functions of banks and also the immediate impact of the measures on sectors which came to depend on bank credit after nationalisation. In RBI's implementation of the reforms, there has been a pattern: three steps forward and one step backward. It jumps into the arena with the shield and sword to march forward with the reforms at the fastest pace but soon slows down in response to appeals by bank chairmen whose vision is limited to the next profit and loss statement and not the least to the impact of the measures on the economic base of their operations. Notwithstanding the availability of plenty of raw data and an army of people, the research support gathered for the reform process appears to be marginal. Anyhow, in its post-scam concern for control and supervision of treasury operations of banks, RBI has lost the developmental perspective of nationalised banking. Achieving the goals of priority sector lending and such other developmental functions are left to the discretion of individual banks. The head offices of banks, on their part, have left it to the discretion of branch managers who are made personally responsible for ensuring that no new non-performing advances develop in the branch. In the present situation, the branch manager has to be the sole entrepreneur taking the risk of loan default whereas the corporate office appropriates the substantial tax rebate on rural lending and also the 50 per cent weightage for priority sector guaranteed advances for calculating capital adequacy. All these have created a crisis in management within individual banks also.

This situation is sure to widen the regional disparities in development. For two reasons there will be a much larger flow of credit to areas with high repayment experience. Firstly, the bank managers will not have much inhibition in lending in these areas where wilful defaulters will be much less. Even wilful defaulters are likely to voluntarily repay loans as the post-GATT scenario offers excellent opportunities to earn more profit from export-oriented agricultural production as brought out by Gulati and Sharma (*EPW*, July 16). In these areas a large number of new units in non-farming activities are also likely to come up providing forward and backward linkages to agricultural activities. In areas with poor repayment experience, farm credit extension will be nil or marginal with no impact on the generation of non-farm activities. Therefore, if bank credit is to be extended in these areas, concerted action has to be taken to ensure that credit is productive and the loan will be repaid. The borrowers may require larger credit than under the earlier norms which frequently resulted in underfinancing and failure of the activity. In these areas, rural branches may require larger and better staff support for proper supervision of credit utilisation and guidance to farmers. Similarly realising the sea-change in the environment in which the branch manager has to exercise his loan sanction powers, state functionaries have to educate borrowers about their moral responsibility for productive utilisation of credit and repaying the loan. In an earlier study made by this writer it was found that recovery with the help of state recovery acts is much better in states with higher voluntary repayment than in states with low voluntary repayment, even though the latter group had a higher proportion of wilful defaulters. For re-establishing the ethics of repayment, some sort of group guarantee may also be adopted in suitable areas. In brief, we have to develop banking entrepreneurship at the grass roots level. To facilitate this, among other things, the various incentives given to banks such as tax rebate based on outstanding rural advances, 50 per cent weightage for guaranteed advances for working out capital adequacy, etc, have to be converted into meaningful support to discretionary decision-making by branch managers. In providing the developmental perspective of profitable and socially responsible banking, the role of planning and research divisions in banks is crucial.

To conclude with a question: given the above-mentioned incentives to rural branches, what should be the level of minimum profitability for rural branches to conform to the spirit of profitable and socially responsible banking?

TV and Violence

Bharat Dogra

Society should intervene with tougher laws to monitor and control the use and portrayal of violence on television, which many psychologists believe is influencing the behaviour of child-viewers.

A GROUP of 25 prominent British child psychologists led by Elisabeth Newson have recently concluded that there is a definite link between violence portrayed in video films and TV and aggression among youngsters. Their report regrets that psychologists have so far underestimated the degree of brutalities and sustained sadism that film-makers were capable of inventing and willing to portray, let alone the special effects technologies which would support such images. The psychologists have recommended that society must intervene with tougher laws since parents may be unwilling or unable to stop this trend.

According to a widely quoted study by S Centerwell of the University of Washington, the introduction of television into the US and Canada led to the doubling of the homicides rate in the 1960s and 1970s, which has been maintained in the 1980s and 1990s. Several factors are no doubt responsible for violence but nevertheless, Centerwell says, "The epidemiologic evidence indicates that if, hypothetically, television technology had never been developed there would today be fewer homicides each year in the United States, 70,000 fewer rapes and 7,00,000 fewer injurious assaults."

Perhaps the most dangerous aspect of TV for small children (below five years specially) is that many times they fail to distinguish between fact and fantasy. So they sometimes try to imitate the imaginary heroes in ways which can seriously hurt them or even kill them. Many such pathetic accidental suicides have been reported from time to time. From Malaysia there were reports (following TV screening of Superman films) of children trying to fly like Superman, 'taking off' from big heights and dying. Four children died and 12 were injured in a spate of such incidents. Such a death has also been reported in India due to the efforts to imitate a comic hero Dhruv. Four Chinese children died after consuming poison. This happened after they had seen a TV programme on hell.

In the US two cartoon characters who have caused a lot of problems in recent years are Beavis and Butt-head. Among their various heroics is a tendency to set fire to anything they can find. Trying to imitate them a five-year old boy in Dayton, Ohio, ignited his bed clothes with a cigarette lighter. The boy's two-year old younger sister died in this fire. Among other things, Beavis and Butt-head are known to "mistreat animals, scream and lust at girl, tell dirty jokes, sniff glue and revel in maximum havoc", as an article in *The Times* said. In another revolting incident in another Ohio town, a fire was started by three young girls who were apparently inspired by watching the TV characters setting fire to each others' hair by igniting the spray from an aerosol bottle. Local fire protection officials said the children admitted they saw the fire act on TV and felt they could repeat it for fun.

Such terrible acts of setting other children on fire, hanging, eating poison and jumping from roofs have a common element—the inability to differentiate between fact and fantasy. This tendency can be reduced if parents (or other elders) sit with children when they are watching TV, share their emotions and give explanations to what they cannot comprehend. (Of course the best way is to entirely avoid the exposure to such risky programmes.)

A different risk arises when grown-up children or youth draw 'inspiration' from detailed violence and crime they see on TV and try to commit similar acts in real life. Violence and crime are frequently shown in cinema and TV programmes in attractive settings and even if this is not the case, certain minds inclined towards violence and crime may nevertheless find the details of crime and violence shown in them to be quite interesting.

In a recent case in Calcutta four youths got together to commit a triple murder. This murder was inspired at least partly by a recently screened current affairs TV programme in which a peculiar murder had been reported in detail. This appears to have attracted the youths. Another aspect of media influence was that a painting of 'thundercat' was discovered from the belongings of one of the murderers. This, as the youth explained himself, was the symbol of a horror show that had been telecast recently. A 12-year old boy tried to recreate the hanging scene in *The Good, the Bad and the Ugly*. He was found unconscious hanging from a wooden beam. A teenager in Delhi who recently forged his own kidnapping was inspired by a Hindi film *Khiladi*. According to newspaper reports, two boys inspired by a Hindi film *Divyashakti* kidnapped a girl, disrobed her and drew various dirty pictures of her body. This happened in the small town of Amravati.

The film *Bonnie and Clyde* led to a series of crimes clearly based on the romanticised acts shown in the film. In San Diego a high school student chopped up his own parents and sister after watching a lurid TV fictionalisation of an old axe-murder case. In the most shocking crime of recent times two 11-year old boys in Britain killed a two-year old baby. They used most violent methods which need not be detailed here. Justice Morland who heard the case said "I suspect that exposure to violent video films may in part be an explanation. When a French youth tried to imitate the hero of an American serial by manufacturing a bomb using easily available ingredients, he died in an explosion. His mother has accused the particular TV channel of encouraging the murder.

Damage of this kind (close linkage because TV/cinema and acts of crime) can be reduced to some extent if care is taken not to show such acts in detail and/or in an attractive setting. In the case of TV details of crime are even more harmful as such programmes can be recorded for repeated viewing, and if video films are available then even this is not necessary. Some time back the national network in India telecast a detective serial Vyomkesh Bakshi which appeared to specialise in showing in detail how items of everyday use can be converted into deadly homicide weapons. This programme was seen week after week by millions. In such cases, if detectives chasing murderers are to be shown on TV, it would be much better to focus on 'who was the murderer', instead of focusing on the details of how the act was committed.

Although abnormal acts (of crime being directly inspired by a TV programme or film) get more attention, the problem that exists on a much wider scale is of course that of the increase in aggressive behaviour in everyday life as a result of media-related influence. It has been argued that hyperactivity and aggressiveness of several children can be attributed to "the release of energy that was stored when they were in a passive state before the TV". But more specifically we should also blame the high violence content of several programmes. It has been estimated that an American child has seen 33,000 murders and 2,00,000 acts of violence by the time s/he is 16 years old. Apart from increasing aggressiveness in the short term, such long-time exposure also leads to a desensitisation towards violence so that violence becomes more easily acceptable in the society.

Any discussion of violence on TV cannot be complete without referring to the impact of the WWF (World Wrestling Federation) fights which are shown regularly on TV to millions of children. These programmes involve a lot of cruelties and perversions but are getting increasingly popular among children. Video films, magazines and posters based on them are also doing brisk business. Special tours of these wrestlers are being sponsored by companies selling cigarettes, ice-cream, etc. Many parents have expressed concern about the World Wrestling Federation fights being shown on TV recently. In these fights the viewers are encouraged to derive sadistic pleasures from strangely dressed persons inflicting torture on each other amidst shouts of 'crush them' 'kill them'. Several parents have complained of aggressive behaviour on the part of their children after watching this programme and one mother lamented that her son had repeatedly attacked his younger sister.

Keeping in view the accumulating evidence of the disturbing impact of TV violence, specially among children and teenagers, it is important to take strong steps to curb the violence content of TV programmes. Parents should also discuss this harmful impact with children to convince them of the need to avoid such programmes. Similarly discussions in school can also be very helpful.

People's Initiative to Solve Water Crisis in Saurashtra

Sanjay Sangvai

This summer people of Saurashtra have launched a movement to evolve and implement a sustainable solution to the perennial water problem in the region.

SINCE the summer of 1994, a new wave has been engulfing the villages in Saurashtra as the people themselves have deviced a sustainable solution on the perennial water problem of their area They have abandoned despondency and have kept away the self-serving politicians and there is no rhetoric and double talk Throughout the months of May June and July there were seminars, meetings and discussions of the villagers on evolving a sustainable solution and how to implement it—the techniques of well-recharging Well recharging has been taken up as a campaign on a war footing by the farmers, their co operative societies and the organisations like Saurashtra Lok Manch Swadhyaya Parivar, Patel Khedut Samaj, Swaminarayan and Pushtimargi religious sects the local Lions and Rotary Clubs and other charitable trusts

Much has been said about the chronic water problem of Saurashtra and the politicians in Gujarat have depicted the entire problem as unsolvable except albeit through the controversial Narmada Project In fact, it has been now proved beyond doubt that the Narmada Project (Sardar Sarovar Project—SSP) will not solve the water crisis of the drought prone areas like Kutch, Saurashtra and north Gujarat Those in power in Gujarat too inadvertently admit this when they defend the project for the prosperity through sugar industry and the industrial development that is expected of the SSP' The local political leaders of these areas too recognise this reality, and privately insist on the decentralised and small-scale water conservation programmes As Jaynarayan Vyas, an MLA from Mehsana in north Gujarat puts it, even if the Narmada Project is realised it will not solve the problem of the drought in north Gujarat If only 1 per cent of the total expenditure on the SSP is spent on the watershed development in a decentralised way in this area, the entire problem will be solved for ever in a fraction of the time that it would take to construct the gigantic SSP, he insisted in Gujarat assembly in 1993

Politicians of all hues have kept the people of the drought-prone areas in the dark about the real problem and the long-term solution Politicians have been making frequent announcements about novel schemes every six months—viz, the pipeline scheme to lift water from Mahi, Narmada, etc, the bridge-cum-pipeline scheme over Gulf of Khambat, the scheme of drinking water in "all villages in drought-prone areas within two years"—and the usual rhetoric about Narmada dream Empty rhetoric and demagogy hold sway instead of scientific understanding

To overcome the problem, the new campaign has concentrated on well recharging According to Harish Jadvani, and Shyamjibhai Antala of Saurashtra Lok Manch (Saurashtra People's Forum), there are over 7,00,000 wells in Saurashtra and almost every village has its own pond ('gam talawadi') Out of these even if 1 00 000 wells are recharged it would solve the water problem of Saurashtra permanently

Empty Assurances

Antala, one of the foremost pioneers of the Jal Sanchay Abhiyan (Water Conservation Campaign) forcefully and rationally put forth the case for the massive campaign for well-recharging in Saurashtra villages In one of his articles in Gujarati daily *Loksatta Jansatta* (July 11) he points out that the people of Saurashtra and Kutch are busy solving their water problem on their own without waiting for any sort of help from the government He laments that there has been no comprehensive and in-depth study regarding the water resources of Gujarat after the study by R G Nambiar in 1975 If there is no planning for the balanced use of the resources and its blend with the demand, then the ground water in the state may be used up by 2000 AD This was the warning given in the report of 1975 In 1989, the Legislative Committee on Public Enterprise had suggested the necessity of well-recharging, but no attention has been paid to these suggestions Further, according to Shyamjibhai Antala, the then chief minister of Gujarat Chimanbhai Patel had announced a Rs 100 crore scheme to solve the water problem of Saurashtra and directed the officials to use the amount before March 1994 But, what happened to this scheme, no one knows A year before, another scheme had been announced to take piped water to the villages of Saurashtra at the cost of Rs 400 crore And more Rs 1,800 crore were earmarked for planning of providing the drinking water through pipeline to every village in Kutch and Saurashtra Recently, the chief minister Chhabil Das Mehta has announced a Rs 1,000 crore for a 10-year plan for providing water for irrigation in Saurashtra, at a Congress meeting in Jamjodhpur In 1986 drought, a master plan for providing water for Gariadhar tehsil in Bhavnagar district costing Rs 23 crore was prepared This remains on paper and today Gariadhar is in the grip of drought

As per the article, out of Rs 11,500 crore of the Eighth Five Year Plan of the state, only Rs 232 crore are earmarked for the irrigation sector Previous experiences too were not encouraging The salt water ingress in the coastal area of the region has been one of the serious problems rendering thousands of hectares of cultivable land useless and making for deterioration of the quality of the ground water In 1978, Rs 1,305 crore were earmarked for preventing sea ingress However, only Rs 62 crore could be spent on this scheme during last 15 years In 1991 92 Rs 10 crore and in 1992-93 Rs 5 crore were allotted for this purpose Other irrigation projects in Saurashtra too had the same experience At present 94 schemes big and small, are on-going in Saurashtra costing around Rs 500 crore However for these 94 irrigation projects, in 1992-93 the state government had allotted Rs 30 crore only Though Antala and others in the Jal Sanchay Campaign do not feel free to probe the reason it is obvious that about two thirds total irrigation budget of the Eighth Plan of the state is spent on only one project, Sardar Sarovar, starving the other schemes and projects in other parts of the state Antala asks that 'The state government could not allocate even Rs 40 crore for the irrigation and salinity ingress prevention in the year 1992 93 What is the meaning of declaring the plans of Rs 100 crore, Rs 1,000 crore or Rs 2,200 crore?

People have now taken the initiative in solving their problems on their own without waiting for help or direction from the government People had resolved to store maximum rain-water, harvesting it and recharging the ground-water, wells, tanks through these water harvesting methods The people are convinced that if they do not act in the direction of rain water harvesting and recharging their ground water resources, the ground-water reservoir of Saurashtra will be exhausted before long Jalsanchay Abhiyan and Saurashtra Lok Manch have been mobilising the people for recharging their wells in the farms Campaigners feel confident that this would solve the problem permanently

Campaigners have made calculations based on data and experience The total area of Saurashtra and Kutch is 2 crore 71 lakh acres Even if we take for granted that average rainfall is 21 inches, it amounts to total precipitation of 4 crore 74 lakh and 25,000 acre feet As these comprise undulating and

rocky terrains, it is assumed that 85 per cent of the rainfall flows to the sea. Only 15 per cent rainfall can be harvested and out of that 5 per cent can be used for recharging the ground water. That comes to around 23 lakh 71,000 acre feet, which can be recharged and may increase the ground water level. Against this, the total requirement of irrigation, domestic and drinking water of 1.25 crore people in Saurashtra-Kutch comes to around 26 lakh acre feet (16.65 lakh acre feet for irrigation purposes and 9.34 lakh acre feet for drinking and domestic purposes). Antala points out that every year two lakh 26,000 acre feet more ground water is extracted than the yearly recharging during the rains. This has resulted in sea-water ingress rendering 25 lakh acres of cultivable land and over 40,000 wells. In Saurashtra alone there are over 7,00,000 wells, which can be recharged at negligible cost. According to the estimate of Haribhai Jadvani, the cost of recharging the well (that is, digging 10 feet by 12 feet trenches around the wells) is around Rs 100 to Rs 150. Tanks, wells, small borewells are the means through which the ground water recharging takes place. Recharging maximum rain-water would result in increasing the water table within five to seven years. According to the rough calculations, every well has the capacity to store 80,000-90,000 gallons of water. Every year, says Antala, 150-200 billion gallons of rain-water would be recharged due to the campaign of well-recharging. And thus, within five-seven years the ground water level in Saurashtra could be restored to normal.

During the monsoon of 1994, 2,25,000 to 2,50,000 farmers had undertaken well-recharging in their own farms. Hundreds of village tanks have been repaired, rejuvenated with the community labour and hundreds of small check dams have been constructed on rivulets, streams in the villages. Government agencies too had undertaken many works. All this will lead, hope the workers of Jal Sanchay Abhiyan, to the solution of the chronic water problem of the area, which seems more to be man-made, due to the kind of farming practices, environmental degradation and overwithdrawal of ground water along with negligence of decentralised, village level initiatives.

The monsoon of 1994 has more than fulfilled the hopes of Saurashtra. Till July 25, there were three spells of heavy rainfall, filling up all the water reservoirs, marooning the low-lying areas and contributing massively to the ground water recharge. Fortunately, this year there is something in this land to hold the torrential rains and store it for the future generations. What petty politicians and bureaucrats could not see and do, the people themselves are doing. Both the objective and the means of the unique campaign are exemplary and need to be replicated.

New World Order and West's War on Population

Amrit Wilson

What years of 'family planning' have shown is that people are unwilling to accept these policies till they themselves have control over their lives. When this happens—when they are sure of survival and are in a position to plan their future—they begin to think of planning their families as well. This, of course, is not the perspective of the west's 'war on population'.

IT is now 'commonsense' that the 'poorer' countries of the world are overpopulated, and 'poor because they are over populated'. To that extent the population control lobby's work of more than 30 years has been successful. But a closer look at the rationale behind the population policies expressed in secret documents now declassified or in the less publicised statements of the US establishment shows that they have little to do with helping these countries. They are committed to maintaining and securing the economic and political dominance of the advanced capitalist countries.

In the 90s particularly there has been a flood of rhetoric on the subject. At the International Conference on the Environment at Rio western governments claimed that the earth is being irrevocably damaged by overpopulation in the 'third world' and the answer is stringent population control. But their arguments were demolished even by the normally aquiescent voices from 'third world' governments who pointed out that the real reason for environmental damage was over-consumption, waste and industrial pollution caused by the advanced capitalist countries.

Now western governments and UN agencies are proclaiming that population growth must be controlled in the interests of development and for the sake of women's rights. This is the theme of the International Conference on Population and Development organised by the International Planned Parenthood Federation (IPPF) and the United Nations Fund for Population Activities (UNFPA) to be held at Cairo in September 1994. Meanwhile at an alternative conference also at Cairo women's organisations from round the world and NGOs will be protesting about these planned and already existing population policies. Also at Cairo, at a public hearing on the Crimes against Women, witnesses will testify from their own experience of the untold suffering to women in third world countries in the name of family planning. They will speak out about the way inadequately tested injectable and implantable contraceptives being 'trialled' on women with the permission of the WHO; about the forced sterilisations which in many countries are the order of the day because third world governments have to meet targets (translated into numbers of women to be sterilised) set by the World Bank or aid agencies; about the way 'targets' actually encourage the killing of girl babies; and about oppressive governments which are conducting slow genocide of certain ethnic groups using the methods validated by population policies.

One of the questions raised by the alternative conference and the public hearing will inevitably be the question of choice: i.e, whether in this situation women are being given any genuine right to choose.

The Background

To understand current population policies, it is worth looking briefly at their history. The notion which permeates population control ideology—that poor powerless people and black people are eating up the world's resources and therefore have no right to breed—goes back to Malthus and the Eugenicists. However as national and international policy, population control only got going in the cold war era. With western capital heavily dependent on the now nominally independent countries of Asia, Africa and Latin America for both markets and cheap labour, 'population' became a subject of paranoia. It was thought that high population growth in the 'third world' would increase the chances of revolution which would draw these countries out of the US orbit. Population therefore had to be studied and methods to control it developed and implemented. In 1962, USAID began assembling information on population growth, in 1969 the US government set up the United Nations Fund for Population Activities (UNFPA) and the World Health Organisation established a Special Fund for Research Development and Research Training in Human Reproduction (HRP). Money spent was regarded as very much worth it because, as Johnson put it, "less than $ 5 invested in population control is worth $ 100 invested in economic growth."

The 70s saw the growth of anti-imperialist movements from Vietnam on and, at the same time, the beginning of the current crisis of capitalism. The US government began to see the people of the third world as a direct threat whose demands for subsistence might destabilise the capitalist system. For strategic reasons certain countries were selected for the implementation of population policies—Kenya and Puerto Rico for example because of their location in areas where the cold war rivalries were particularly focused; and India because of its internal politics (these were the years of the naxalite uprising) and its cordial relationship with the Soviet Union.

Population and Western Dominance

In July 1969 president Nixon had proposed that Congress establish a 'Commission on Population Growth and the American Future' and at the same time the secretaries of state, treasury, the AID administrator, and the directors of the USIS and Peace Corp had been asked to "enlist the active support of all US representatives abroad to encourage and assist developing nations to recognise and take action to protect against hazards of unchecked population growth". In 1974 he directed the National Security Council Under Secretaries Committee to examine how world population was likely to affect US security interests over the next 25 years. The document—the National Security Study Memorandum 200—was prepared during the Ford administration by the departments of state, defence and agriculture and by the CIA it was adopted as official National Security policy in late 1975. Now declassified, it is a frank declaration of the US's major concerns: firstly, the radicalisation of the 'developing world' to a point where "younger people—who are more prevalent in high-fertility populations—can more readily be persuaded to attack such targets as multinational corporations"; secondly, that certain third world countries, e.g. Bangladesh "whose position on international issues will be likely to become radicalised...as its problems grow...inevitably in opposition to US interests", might then "advocate a better distribution of the world's wealth", thirdly, that "in the absence of slow or zero population growth, concessions to foreign companies are likely to be expropriated of subject to arbitrary intervention. Whether through government action, labour conflicts, sabotage, civil disturbance, the smooth flow of needed materials will be jeopardised".

To prevent all this, measures are suggested which over the years became thoroughly integrated into US foreign policy, for example, that development assistance is, "integrated" into population planning and health into family planning. This integrated health and family planning would "help the US contend with the ideological charge that it is more interested in curbing numbers of LDC (less developed country) people than it is in their future and well-being". The use of food assistance as leverage is also recommended but "it is important in style as well as substance to avoid the appearan of coercion". (In fact food aid was used to

enforce sterilisation policies particularly during the floods in Bangladesh in the 70s.)

Women's Rights and Sustainable Development

If the basis of population control policy was being laid way back in the 70s, there were also the first signs of a sudden concern for 'women's rights' to contraception. Feminism had placed women's rights on the agenda and this was a cynical attempt to use it against women. And on a practical level women would have to be targeted anyway because attempts to impose population control by performing vasectomies on men had failed miserably (in one major experiment in India, it had contributed to the fall of Indira Gandhi's government). There were in addition other advantages in targeting women, firstly, that violence against women had reached such proportions in most 'third world' countries that this new assault on women's bodies would be seen as 'acceptable' by the governments in these countries; and secondly it would ensure that progressive organisations, the left in general and in fact most men would simply ignore these developments as mere 'women's issues'—nothing to do with them. In other words, sexism would provide the smokescreen behind which these major strategies of imperialism were put in place.

The concept of 'sustainable development' was also being worked out at the same time. Now fully accepted by international agencies, 'sustainable development' sounds on the face of it extremely reasonable, as Nafis Sadik, the executive director of the UNFPA puts it, it is a "sustainable balance between population, natural resources, consumption and production...both developing and industrial countries have complementary responsibilites". However, she says, "This is not time or reason for ideological debates". Why not? Is it because such debates might lead to inconvenient questions such as 'sustainable by whom?' and why 'sustainable' rather than 'self-sustaining'? Underlying the concept of sustainable development are the assumptions that the status quo will be maintained in 'third world' countries; that agricultural countries will never become industrial countries serving their people; that cash crop economies will remain as they are, their people will remain dependent on food and aid and loans from outside; that the advanced capitalist countries will continue their exploitation of the so-called 'Less Developed Countries'.

Embarrassingly enough for the population control establishment, even while these concepts were being consolidated, research by the US scientists was showing that there was very little correlation between population growth and per capita income and the relationship between population growth and economic development was complex. For example, Julian Simon's work in 1973 showed that moderate population growth is a stimulus to economic development, rapid population only a mild deterrent and zero population growth and population decline are strong deterrents.

By the 80s the US government had set aside almost $ 3 billion specifically for population control activities. At the same time USAID was supporting population activities in 95 countries, including 45 sub-Saharan countries (now targeted as of special interest) and the World Bank had emerged as one of the major moneylenders for population control, third only to the UNFPA and USAID. And in addition to the money lent directly for population control the World Bank was making many of its loans conditional on the implementation of population control. According to Fred Sai (former president of the IPPF) and Lauren Chester (writing in *Population Policy: Contemporary Issues*, New York, Praeger, 1990) it had committed $ 750 million to 29 population projects in 14 countries round the world, and carries on "policy dialogue with government officials on the impact of rapid population growth on development objectives and strategies and analysis of population growth and the role it plays in economic development". These analyses then provide an "avenue for influencing government population policy". The Bank's population activities include research "to improve the understanding of the links between development and population growth, and collaboration and co-operation in international efforts to stimulate concern for...population issues, and to encourage consensus on policy issues."

In fact the World Bank and the US government's actions are often indistinguishable. Taking on board the recommendations of the US government's National Security Study 200, the World Bank set up, in 1979, a new Population Health and Nutrition Department (PHN). And while "health became an operational issue" not surprisingly it turned out that "stress was placed primarily on the relationship between health and population, both in the delivery of family planning...and to open dialogue with countries which had yet to develop explicit population and family planning objectives. The volume of lending continued to increase under this new structure."

While these cynical and often inhuman policies were being implemented, strict discipline was maintained within the World Bank. Staff were drawn into line through

seminars which emphasised "the far-reaching implications of rapid population growth for general economic development and individual sectors" and here too consensus was achieved.

The World Bank's influence on population policy in Indonesia receives special praise from Sai and Chester. What is not mentioned by them is Indonesia's repressive and violent population control programme which includes the use of untested injectable and implantable contraceptives and sterilisation in a genocidal attack on the East Timorese people. "The Bank's sector work", write Sai and Chester, "supported the government's innovative ideas for a population programme and in part formed a basis for the programme. [It also] helped the government implement its ideas."

As for Africa the Bank has increased attention to population issues in sub-Saharan Africa despite its extremely low population. For example, countries such as Botswana have a population density of only 2.23 people per sq km compared to 230 per sq km in the UK or 320 in Belgium. Africa's underdevelopment is at least partly due to the loss of population in the slave trade of the 17th, 18th and 19th centuries from which the continent never recovered. However it is not underpopulation but the 'high growth rate' (which could in fact have stimulated the economy) which is worrying the World Bank. It has been busy in Africa, setting up projects (a large proportion of the total PHN sector reports are on Africa) and apparently most crucial of all influencing leaders. In Senegal "The Bank's sector work... probably influenced to some degree both government officials (including the president) and regional Bank staff on the importance of population. The population sector work prompted Bank regional staff to talk about population with high-level officials when discussing terms for a structural adjustment loan (SAL). As a result, preparation of a Population Policy Statement and Action Plan became an agreed condition of the release of the third tranche of the SAL...this Population Policy Statement has been drafted by the Bank and will eventually be discussed at a national workshop. It will then go to the president and council of ministers for approval... It will be translated into a priority investment programme. Here...explicit targets will be identified.

New World Order and Implementation of Population Policies

In this new phase of capitalist development, the role of the state has altered to the extent that emphasis is now placed not on its function as a nation state but on its activities as a facilitator of global capital. Since now MNCs can choose suitable sites of investment and then move on as they wish to regions of cheaper and/or more suitable labour, laxer labour laws and more tax concessions, what is required is not the classical pattern of labour mobility but a new one of capital mobility and labour immobility.

Maintaining such an environment requires coercion and repression and this is now the role of the 'third world state'. In the creation of an ideally docile and immobile pool of labour such measures as national security laws and anti-trade union laws are essential but they are being used in conjunction with the slightly longer-term policy of population control. And just as the state is in charge of the implementation of Structural Adjustment Policies dictated by the World Bank, the IMF and the WTO, it also provides the infrastructure for the implementation of population policies and targets set by the international population control agencies—the UNFPA, IPPF and others. (Currently in India the draft stage of new population policy has even recommended the use of the army and para-military forces for 'population stabilisation'.) The responsibility for the research and development of contraceptives is also that of an international body—the Population Council which while closely linked to multinational drug companies has a board of directors including US state department officials, World Bank officials, ex-US army officials.

However there is no need to speculate about the role of population control in providing the needs of global capital. It has been discussed widely by key actors in the field and their opinions have been collated and analysed and published in 'population issues of concern to the Foreign Policy Community October 1993—a literature search and bibliography prepared by the Population Reference Bureau for the Pew Charitable Trust's Global Stewardship Initiative' by Alex de Sherbinin. The "US Foreign Policy Community" (defined by de Sherbinin as comprising those working directly on the design and implementation of foreign policy and those advising/observing the process—including the state department, AID, US Department of Defence, the US National Security Council, the CIA and think-tanks such as the Centre of Strategic and International Studies) are quite open and down to earth about the role of population control. De Sherbinin sums up the main issues in the accompanying diagram. He shows how control of 'third world' populations interlocks with and provides the long-term regulator for very many of the recent economic and political initiatives in Europe and the US, all of which aim at a situation where labour is immobile, they also foresee some of the developments which are to be part of the New World Order. For example, Box 2 'LDC inability to meet job, infrastructure needs' foresees the effects of massive retrenchment and cuts in welfare services which are a part of structural adjustment; Box 5 'migration, US immigration and other international migrants and refugees' takes account of the unemployment which is being expected in the G-7 countries and the creation of barriers around trade blocks like Fortress Europe which would require if necessary the sending back of refugees to torture and death in their countries of origin, in total contravention of all International Regulations on Human Rights; Box 13 'insufficient food production' implies the food scarcity in countries particularly of Asia and Africa because of cash crop production on the one hand and the effects of the 'free market' and GATT on the other; Box 10 'racial and ethnic or religious conflicts' suggests the fear of civil wars thanks to the proliferation of US manufactured arms and arms from the old Soviet Union, and also suggests that there will be intervention and sometimes genocidal policies in the interests of 'maintaining a balance' (Rwanda's problems for example are already being linked with population pressure); Box 1 confirms the Memorandum 200 policy of targeting of countries with young populations as in Bangladesh and in the countries of sub-Saharan Africa—countries essentially where life expectancy is low and disasters frequent. In addition to the diagram, Sherbinin expands on specific issues among them US access to strategic resources. In this context "African nations produce between 90 and 100 per cent of four minerals vital to US industry: platinum, manganese, chromium, and cobalt" and as Sherbinin points out secretary of defence Richard Cheney reported to the president and Congress in 1993: "Failure by the western nations to promote stability in Africa could result in disruption in the production and distribution of strategically important resources and could reduce access to facilities important to regional contingencies". No wonder then that Africa, particularly sub-Saharan Africa, has been targeted for population control.

How Targets Are Implemented

On a more practical level how do 'third world' states set about implementing the population policies forced on them? In India the state agreed, in 1983, to a target of a net reproductive rate of 1 by the year 2001. NRR of 1 means that each woman at the end of her lifetime would be replaced by just one daughter. In a country where there is enormous pressure to produce a son and where there are already a large number of girl babies killed, this amounts to encouraging female infanticide. However this was no deterrent, the problem was simply that the target was not practicable. The time span was increased by another 10-15 years to 2011-16. But even this according to a recent study (undertaken jointly by the Gujarat Institute of Development Research and the

Population Council) is an unrealistic aim and can only be achieved "under regimes of very high mortality...as happened in the Indian subcontinent during 1911-21" when there was an influenza epidemic which killed a large proportion of the population. As the study points out, Gujarat's infant mortality rate is 67 per 1,000 live births compared to seven which is the average for the UK. But obviously this figure is too low for the NRR to be achieved! All this makes it abundantly clear that what population control is about is not a better life for people in India but simply less people in India so that the west faces no hindrance in keeping control of the world's resources.

How has the Indian government managed to meet these targets in the short term? Targets are translated to numbers for each state and district. After this it is a story of coercion and corruption.

For example, a recent expose of the situation in Puranpur, UP, in India showed that when central and state governments are unable to meet impossibly high targets, the district administration sets targets for non-health departments—school teachers, officials of co-operative societies, forest officers and so on. In December 1993, 80 per cent of these employees had their salaries stopped for non-achievement of targets. In 1994 they kidnapped large numbers of women from neighbouring Nepal, forced them on to buses and then drove them to dingy warehouses to be forcibly sterilised. In this situation (which is not unique to India) can anyone believe that what these women are getting what the population control lobby calls the 'human right to contraception'?

There is no doubt that women desperately need control over their own fertility. They need contraception which they can choose and most crucially contraception which they themselves can control. But national population policies concerned with meeting targets not only do not meet this need, they take control out of the hands of women. If previously in their struggle for control of their fertility they had to take on the sexism and brutality of individual men within or outside the family and often feudal oppression from the family itself now they are also up against the forces of advanced capitalism which want to control and limit their fertility in an effort to continue their exploitation.

In this context, it is striking that the contraceptives used in family planning programmes are almost invariably controlled (inserted and removed) only by medical or para-medical intervention. This means that women who are injected or implanted no longer have control over their own fertility.

Long-Acting Contraceptives

Among the contraceptives widely used in population control is the injectable Depo-Provera. A public inquiry conducted on this drug in the US in 1984 held that data on its carcinogenic potential was insufficient to prove its safety. It is now to be manufactured in India in a collaboration between Max Pharma India and UpJohn USA.

The most widely used of the implants is Norplant. This is being trialled (or tested) in third world countries with the permission of the WHO. It consists of five capsules which are implanted in the upper arm and contain a steroid called levonorgestrel. Apart from possible side effects of hormonal disturbances, absorption of levonorgestrel by infants through mothers milk, circulatory and heart problems, there are established risks of ectopic pregnancies (which can be fatal) for women who have been on Norplant. Norplant therefore requires careful follow-up services. It lasts for five years and requires minor surgery to remove.

Also making its way on to family planning programmes round the 'third world' is an anti-pregnancy vaccine developed and tested under the management of the WHO which acts through the immune system. The first experiments on already sterilised women resulted in 25 per cent of cases in a collapse of the immune system.

If follow-up services have been recognised as essential for all these contraceptives, what infrastructure is available for follow-up? In India where health services are stronger than in many other 'third world' countries, 300 women selected for the pilot study on the implantable contraceptive Norplant are now untraceable. This is alarming but not really surprising since India has one Primary Health Centre for 30,000 people and one sub-centre for 5,000 (and these sub-centres may well have neither medicine nor any sort of auxiliary nurse or midwife).

Resistance

Third world women have organised widely against population control, the alternative hearings and testimonies at Cairo are only one example of the activities of a growing movement.

In addition, of course, there is opposition to contraception itself from Muslim and Catholic organisations, to counter this the population control lobby is producing material claiming that population control is not only not un-Islamic but explicitly sanctioned by it. (For example, the Indonesian authorities have produced a booklet on the topic and UNFPA have produced *Family Planning: The Legacy of Islam*, Routledge.)

However what the years of 'Family Planning' have shown is that people, in cities or villages in 'third world' countries in general, are unwilling to accept these policies till they themselves have control of their lives. When this happens—when they are sure of survival and are in a position to plan their future—they begin to think of planning their families as well. They cannot do this till infant mortality falls, till diseases are overcome and till they achieve a minimum quality of life. World Bank policy-makers are well aware of this, they acknowledge that they are 'encountering resistance' to sterilisation and have suggested a shift to injectable and implantable long acting contraception despite the dangers of these methods—in other words it is to be a shift from coercion to deception since in most cases the women do not know what injections they are being given or what the implants are doing to their bodies. These programmes far from giving the right to choose breach the most basic requirement for choice—that women and not governments or foreign agencies or even doctors must have control over their bodies.

But choice is not what population control is about. In the words of de Sherbinin: "The US national security agenda has broadened considerably since the collapse of communism in the Soviet Union and the East Bloc...In the post-cold war era foreign policy is much more complex, encompassing such diverse issues as international migration, economic development, environmental degradation, and religious fundamental... global developments now suggest the need for a broadening definition of national security to include resource, environmental and demographic issues...the average American's interest in maintaining high standards of living has been a potential motivator for US population policy from its earliest formation and it is likely that this will continue for the foreseeable future."

Keynes's Indian Connection

Arun Banerji

Keynes and India: A Study in Economics and Biography by Anand Chandavarkar; Macmillan, London; pp xiii + 209, price not mentioned.

ANAND CHANDAVARKAR has made a refreshing and valuable addition to the rich, though not large, treasure of writings on the history of economic thought. For India, we have, of course, B N Ganguli's *Indian Economic Thought: Nineteenth Century Perspectives* and Bhabatosh Datta's *Indian Economic Thought: Twentieth Century Perspectives*, which Malcolm Adiseshia called a "monumental work". But Chandavarkar studies an almost neglected aspect of the work of the greatest economist of this century, analysing the interaction of Indian experience on Keynes's thought and work, and of Keynes on Indian economic thought and policy. It is a pioneering study, reflecting his wide and catholic reading, which has enriched his admirable style—an accomplishment that is acquiring a scarcity value with the writings of most economists.

In his Prologue, Chandavarkar raises two interesting questions—first, the virtual absence of any reference to "the crucial formative role of the Indian Connection in Keynes's life and work and its contribution to the development of his economic ideas and its manifestations in his psyche and career" in the three full-length biographies of Keynes and the prolific symposia published on virtually every aspect of Keynes. Chandavarkar extends the Indian connection over almost four decades—from Keynes joining the India Office to his role *vis-a-vis* India at Bretton Woods and Savannah, including his role in the Indian currency discussions of 1913, 1919 and 1926, and contacts with other Indian problems and with Indian students at Cambridge. To the west, it may be no more than his first book, *Indian Currency and Finance* (*ICF* below; all page references to this are to the Royal Economic Society edition, 1971).

The second, and to me the more important, question he raises is: what triggered Keynes's interest in India, despite the absence of any family tradition of service or other links with India? He seems to find an answer in what Sayers wrote in 1972: "the problems of the British Government of India stood as a great challenge, luring many of the intelligent men of the age into its service, out of all proportion to its economic importance". This is true, even more so for the generations before Keynes. One does not even have to think before such names as Charles Trevelyan, William Mansfield, David Barbour, John and Richard Strachey and Sir Edward Law come to mind, and bankers like Brunyate and Lindsay. But of academics, even of a much lower order of brilliance than Maynard Keynes, one seeks in vain. The longer I have poured over *ICF* the more baffled I have felt in answering Chandavarkar's "basic question". I shall return to it below.

Chandavarkar's slim 196-page book (excluding bibliography and index) has 10 chapters; these seem to fall into three broad divisions—(a) service with India Office, writing *ICF*, membership of the Royal Commission on Indian Finance and Currency, 1913, and evidence before the Babington Smith Committee, 1919, and the Royal Commission on Indian Currency and Finance, 1925 (chapters 1-4); (b) his memorandum submitted to the 1913 Commission on proposals for a State Bank in India (chapter 5); and (c) Bretton Woods and Savannah, which Keynes's *Collected Works*, Vol XXIII subtitle as 'Shaping the Post-War World', relation with Indian students at Cambridge, and his attitude to a few specific issues (chapters 6-10). Right at the beginning of his work, Chandavarkar stresses the need for reassessment and periodic reappraisals of persons of Keynes's protean intelligence and achievements. We are indeed grateful for the many shafts of light he has thrown on little known facts, and for the nostalgia he must have evoked in those who had seen his subject in real life. This was perhaps not the occasion for Chandavarkar to attempt an objective and critical appreciation of Keynes's work on India. I do hope he will return to that, eminently qualified as he is for it. May I suggest to him a re-study of Keynes's ideas on the State Bank in relation to both what India in the 1920s and 1930s needed, and what in fact it got in 1934, and their implications for the succeeding decades? Some criticisms by Chandavarkar there certainly are in the work—like Keynes never sponsoring any Indian for the Apostles, Cambridge University's elite society dating back to 1820, and his advocacy of free trade for India based on a wholly static concept of the comparative cost advantage of India in agriculture which led him to oppose India's industrialisation. In chapter 7, Chandavarkar returns to this, and clearly states as 'Keynes's failing' "the excessive concentration on monetary problems amounting to a virtual exclusion of basic non-monetary issues. Thus, Keynes was sceptical of India's industrialisation" (p 135). In the penultimate chapter, he also speaks of Keynes's "staid view of British rule in India". Assessments of these types may contain the clue as to why Keynes was not a development economist, not that he has not more than made up for it by his *Tract, Treatise, General Theory* and the revolutionary ideas on the Fund and the World Bank. It is perhaps these latter that Hirschman had in mind when he wrote *Development Economics in 1981* from which Chandavarkar quotes on page 146. Of the three broad divisions into which I have placed the successive chapters of Chandavarkar's book, in this review I intend to write largely about the first. But before I come to that, I must state that the quality of paper used by Macmillan for the copy in my hands, presumably an Indian edition, is such that one can barely scribble legible pencil jottings on the margin!

* * *

Chandavarkar tells us that Keynes was in the India Office for less than two years, from October 1906 to July 1908 ('1909' in the first line on p 25 seems a printing error), 'Apprenticeship to Greatness', in his words. There he handled various matters pertaining to the military department, trade in jute, the search for a Director of Statistics, etc, but it is known that he never had anything to do with Indian Currency or the Finance Department (Chandavarkar, p 58). Keynes's letter of resignation to Sir Thomas Holderness (of June 5, 1908) had carefully stressed "please do not think that I have disliked my work in the Revenue Department or have been discontented" (p 20). So I wonder how Austin Robinson wrote in 1947 regarding Keynes's short period at the India Office thus: "He had formed an abiding interest in the problems of Indian currency and finance" (p 21). Considering Keynes's meteoric rise in Whitehall in the next few years, Harrod's remarks are perceptive—"His brief spell at the India Office. had made his abilities known to the officials of the Office. That knowledge was a necessary link in the chain of events which brought Keynes into prominence in public affairs early in life" (p 21).

Chandavarkar has noticed some interesting features of Keynes's life at the India Office. While in the Revenue, Statistics and Commerce Department, he was able to do extensive reading, "everything comes to me to read, and I read it", he wrote to Lytton Strachey. He also wrote drafts of memoranda

on a variety of subjects: "the proposed grant of a monopoly of bonded warehouses in Cyprus; the prevention of smuggling of liquor from Portuguese India into British India; and the imposition of a low fixed licence fee to combat illicit distillation of country liquor in the Punjab" (p 13). All these minutes are notable, Chandavarkar adds, for their shrewd eye for detail and a rare feel for the subtle interplay of economic and social factors. Keynes also made his voice heard in the matter of looking for a Director of Statistics "by the appointment of a real trained statistician". But soon he grew "thoroughly sick of this place" and wanted to resign, a decision which became effective in July 1908, and signalled his return to Cambridge.

Keynes's departure from the India Office seems to have strengthened and enlarged his involvement with Indian affairs, with writings and lectures on both monetary and non-monetary themes. Former colleagues at the India Office were especially supportive of his work, through discussions and correspondence. The most notable among these was Sir Lionel Abrahams (Financial Secretary, and later Under-Secretary of State for India), aptly described "as the moulder and manipulator of India's involved but efficient financial system" and Keynes's "mentor". Among the important papers Keynes wrote at this time was the one published in *The Economic Journal* 1909, in which prices figure prominently. Strangely, prices do not appear in his first book, *ICF*.

Keynes was also involved in a controversy with one Beaumont and another anonymous writer in the columns of *The Economist* in 1909 on 'British Investments in India'. His estimate is one of the more reliable ones even today. He developed an interesting argument by calling to his aid Council bill sales by the Secretary of State, but this did not carry the argument far enough. I cannot lay my hands on the journal, but have a feeling that since during 1903-07, sales of Council bills greatly exceeded the government's budget estimates, this may possibly have a role in reconciling the positions taken by Keynes and Beaumont.

The more important paper was the one on Indian currency to the meeting of the Royal Economic Society on May 9, 1911. According to Chandavarkar, this was later developed into his *ICF* (p 60). Abrahams made a copy of Keynes's draft for the use of the India Office, and even for the government of India which later printed it in Simla for internal use (and answering the increasingly vocal critics)! How important it is to have a Cambridge man upholding the handiwork of the India Office which had been facing strident criticism for the gold exchange standard it had created for India? And India Office knew more critics were going to raise their voices, including even the till-then loyal 'Anglo-Indian' press in India. The youthful Keynes wrote of the gold exchange standard being "much more civilised" than a gold currency, and the presence of precious metals among circulating media as being not only "wasteful", but "uncivilised" too. It was not long before Keynes "rose to the defence of Abraham's system", and wrote to *The Times* (October 26 and November 14, 1912) (Chandavarkar, p 64, and *Collected Works*, pp 88-94).

In May 1913, the world saw Keynes's first book, *Indian Currency and Finance*. It had a surprisingly cryptic 10-line Preface, and no acknowledgements at all, presumably as he had just then been "offered a seat on the Royal Commission (1913) on Indian Finance and Currency". To acknowledge the enormous debt to the India Office at that moment would be totally out of the question. By that time, of course, the exchange standard had already been cobbled together by India Office into a finished product, including even a surprising U-turn by the government— early in 1913, Sir Guy Fleetwood Wilson announced in the Governor-General's Legislative Council the decision to mint a special Indian gold coin—though not the sovereign. Keynes noted this (*ICF*, p 48), but chose not to probe into the motivation of the India Office to take this decision. Only a year earlier Sir Guy had marshalled an invincible array of arguments for not doing this! However, Keynes presented a commendably competent exposition of the complex system of the Indian version of the gold exchange standard. For him, writing this book involved taking apart the pieces of the jig-saw puzzle, and then systematically putting them together so that the reader could grasp the interconnections without too much confusion. This was no mean achievement. It did have some criticisms too, which the Royal Commission accepted. At various places the need for a State Bank is mentioned, but not fully developed. The ideas must have been already in his mind, as his Memorandum to the Royal Commission is dated '6th October, 1913'.

We see from a letter dated April 21, 1913 from Austen Chamberlain, chairman of the Royal Commission set up only four days earlier, to Keynes, from which Chandavarkar quotes an extract, that the Secretary of State, Lord Crewe, had seen the proof sheets of *ICF*, and that "the character of the work and its subject were a qualification" for him to propose Keynes's name to the King to be a member of the Commission. Crewe would have certainly observed the tone and temper of Keynes's writings on Indian currency for over two years, and been briefed on these matters by Abrahams. The paper of 1911 could not have gone to Simla without the approval of the Secretary of State. As Abrahams, an official, could not be on the Commission, Crewe was certain that Keynes would prove redoubtable to critics, both academic, if any, and men of the world, of the edifice the India Office had raised over a whole decade-and-a-half.

One of the first reviews of *ICF* appeared in *The Economic Journal*, December 1913, by none other than H S Foxwell (pp 561-72). Keynes was already editor of the journal. Despite some critical remarks, Foxwell bestows considerable praise on the author. What especially struck me is Foxwell's very perceptive remark: "The timing of its appearance may have been determined by the very energetic but ill-considered attack on the Indian monetary administration last autumn, but *the phrasing of some passages rather suggests that they were originally written as a memorandum or report for official use*" (p 561). The world had to wait for almost 60 years till the Royal Economic Society published Vol XV of the *Collected Works of Keynes* to know at least something more on how the book came to be written.

Chandavarkar must be commended for the succinct yet mature account of Keynes's role in the Royal Commission, especially of Keynes's very intelligent suggestion on the fiduciary portion of Indian paper currency (pp 70-71), and how the Commission accepted some of his other suggestions. He has stated that Keynes was truly the moving spirit of the Commission. Although one of 10 commissioners, he asked about one-sixth of all the questions put to the witnesses. The editors of Keynes's *Collected Works*, Vol XV, have wisely quoted extensively from evidence taken by Keynes of four witnesses. I shall not lengthen this review further by referring to other parts of Chandavarkar's interesting book. He has brought out very ably Keynes's interest in some specific Indian economic issues of the 1930s, and his association with the views and problems of the Indian delegation to Bretton Woods. Of chapter 7, I have already touched on an important matter the author has brought to light, viz, Keynes's attitude to India's industrialisation. The chapter 'Keynes—The Guru' would no doubt evoke nostalgia among some. The record of I G Patel's personal impressions of Keynes at a meeting to discuss the Anglo-American loan is certainly of great interest.

* * *

I stated above that, like Chandavarkar, I too am seeking the origin of Keynes's interest in India—in my case, more particularly, why and how he wrote his *ICF*. A brief discussion of three specific matters from this book will, I hope, point to the reader where my bafflement lies, and if it is legitimate. These three matters are: the government's attempt to introduce sovereigns into active circulation in 1900;

the account of the exchange crisis of 1907-08; and Keynes's perception of the implications of the large accumulation of treasury balances in the busy season when taxes are flowing in fastest, and the release of the accumulating currency in India through the sale of council bills.

ICF gives a bland account of the attempt to introduce sovereigns into circulation in accordance to the recommendations of the Fowler Committee, 1898 on page 52. Early in 1900, the government began to pay out gold to the public at the Currency Offices in Calcutta, Madras and Bombay—by giving instructions "to tender gold to all presenters of notes, but to give rupees if they were preferred". Authorisation was also issued to send sovereigns to the larger district treasuries, and post offices in presidency towns began to give gold in payment of money orders, and the presidency banks were requested to issue sovereigns in making payments on government account. By March 1901, £ 6.75 mn of sovereigns had been put into the hands of the public. But, and this is important for Keynes, "of this amount part was exported, not far short of half was returned to government, and it was supposed that the greater part of the remainder went into the hands of the bullion dealers" (Keynes's source is the *Report of the Comptroller of Paper Currency.*) With this experience, "further attempts to force gold into circulation were, therefore, abandoned". The failure of this attempt was important for the India Office, so that it could be harped upon, and the Chamberlain Commission could say, unabashedly, that the people of India "neither desire nor need" any considerable amount of gold for circulation as currency.

To correctly apprehend this incident, two material facts are needed: these Keynes does not supply. During the decade ended 1892-93, the coinage of rupees averaged Rs 8.24 crore a year. This dwindled to Rs 3.2 crore in the following years till 1899-1900, due to the closure of the mints in 1893, producing a currency famine, of course one of the reasons for the rise of the exchange to 16d in 1898. More importantly, I wish to draw attention to the state of India in the late 1890s, for which I can do no better than quote Sir Verney Lovett (*Cambridge History of India*, Vol VI, 1932, pp 306-07)—a grave failure of the rains in 1896-97, affecting a population of 62 millions, 34 millions in "tracts severely distressed". This calamity led to the appointment of a Famine Commission. Before their recommendations could be considered, "India was visited by a drought *the greatest in extent and intensity which she had experienced for 200 years*... The loss in crops alone amounted to £ 50 mn in British India and £ 30 million in the Indian states". Curzon, then Viceroy, placed the agricultural production in 1899-1900 at least one-quarter, if not one-third, below the average. Water supplies shrank considerably; an enormous fodder famine produced an unprecedented devastation of all kinds of cattle. Then came cholera, dysentery and fever, upon an already exhausted and enfeebled population. These calamities aggravated the man-made shortage of rupees; the cultivators affected by them could not even earn a few rupees by the sale of their produce. Their cattle had perished by the hundreds of thousands. Usury and exploitation were rampant of which the government was fully informed. It was a cruel joke to offer gold sovereigns to a population reeling under the twin calamities of man and nature. Before this, Marie Antoinette's reported advice to those who did not have bread pales into insignificance.

The account of the Indian exchange crisis of 1907-08 (*ICF* pp 96-98) seems to raise a similar question. Of the 'crisis' and 'storm' which the Secretary of State had to confront in late 1907, we are only told: "it had become plain that the Indian harvest would be a bad one, and the financial crisis in the United States was fast developing"; and on November 7, the Bank of England raised its rate to 7 per cent, for the first time since 1873. These are all the reader is told; how exactly they affected the Secretary of State, especially the US crisis, is left to the reader to guess. Some facts about the sale of Council bills are given. Very meagre sale in early November was followed by none for several weeks, with "no further steps for the support of exchange", which Keynes ascribes to the situation being *"perplexing and unprecedented*", and that "it was some weeks before his [Secretary of State's] advisers found their bearings". The authorities *"nerved themselves" at the end of December* to take such "drastic steps" as may be needed to maintain the gold value of the rupee. Again there were unexplained delays and indecision.

A probe into this period at the London end reveals that it was the Bank of England which weathered the 'storm' even from the spring of 1906. It originated in speculation in New York, involving many American banks, and money had been raised in London for lending to speculators across the Atlantic, leading to a crash in American rail stocks in London. The crisis of October 1907 has been called the "worst between 1890 and 1914" (Sayers), involving heavy loss of gold by the Bank of England, and repercussions in Europe and Canada in late 1907. The Bank made serious expensive bids for gold in the market, and got it from France and a number of other countries to restore its holdings. The situation returned to normal in early 1908. All this time, October 1906 to July 1908, Keynes was in the India Office.

What strikes me in this episode is the uncanny synchronisation of the phases of inactivity and loss of nerve of the India Office advisers and the gestures of 'drastic' steps to maintain the gold value of the rupee with the stages through which the Bank of England and the British monetary system then travelled during this "worst crisis" (cf. Sayers, *The Bank of England, 1891-1944*). Keynes could not, of course, dream of pointing to this if my presumption that that is where the crisis lay is correct. London could not risk the faintest admission that the Secretary of State's inaction, lasting for months, in this first crisis of the newly set up gold exchange standard of India, arose from the Bank of England then wrestling to protect its own gold reserve. That would be the proverbial last nail on the coffin of the Secretary of State's emphatic and persistent espousal of the benefits to India in keeping her costly reserves in England where they would be available at the first sight of any adverse trends in India's external account, even if the reserves were not in liquid gold. I am offering a hypothesis to account for the inaction of the Secretary of State, the costs of which to India remain yet to be gauged, and will be happy if scholars respond to this, to throw light on an as yet important but dark episode of our financial history.

The third issue relates to Keynes's perception of the "difficulty and inconvenience" arising from tax payments withdrawing large funds from the market into the Indian Treasury almost just when the money market needs them. The ill-effects of this, he stated, "are to a certain extent counteracted by a transference of these funds to London and a release of the accumulated currency in India through the sale of Council bills" (p 40). For almost half-a-century, the India Office propagated this thesis. And the Indian public meekly swallowed this stubborn refusal of the authorities to recognise that this release of the proceeds of taxation to buy sterling for the home charges was *not* a remedy for the stringency and accompanying deflationary pressure on the economy. Those proceeds should have been released by regular government spending in India on goods and services, investments, and transfer payments, which would complement the earlier stream of withdrawals from incomes through taxes. In the absence of home charges and of substantial private remittances, the favourable trade balance of India, if any, would be reflected in foreign investments by India, or repayment of earlier foreign loans, or the import of bullion, and over a period, relatively more imports as the import of bullion tended to discourage some exports and encourage some imports. But those on the right side of the Imperial divide always turned a blind eye to this.

Chandavarkar tells us that 'drain' did not excite Keynes, whose interest was always

"in specific policy issues rather than in grand themes like metropolitan exploitation of the colonies" (p 39). (See p 135 for a rather disparaging remark of Keynes on this matter.) But in regard to the Council bills, for his lectures at Cambridge and London on the Indian monetary system, was Keynes not aware of Goschen's unequivocal assertion in his report to the House of Commons in 1876 that these bills affected India's ability to import silver, or of the series of articles on silver and the home charges that Bagehot wrote at that time (reprint published by H S King, London, 1877)? Bagehot had no hesitation in calling these charges "tribute", for "such economically it is". Among the effects of imposing a tribute on the industry of a dependent country, Bagehot gave the first place to driving away all cosmopolitan capital which can carry on business elsewhere. And, as a rule, the effect of the tribute will be to lower prices. Given the usual assumptions of classical economics, the employment effect had to wait for recognition till Keynes's *General Theory*, though some empirical studies of the early 1900s were pointing to it. Marshall too had referred to them in memoranda and oral evidences submitted to various enquiry bodies during the 1880s and the 1890s. Speaking before the Gold and Silver Commission, he stated categorically that "I consider that this [Council bills representing payments fixed in gold] is a disturbing element in the trade of India". In the controversy with Ohlin on reparations (*Economic Journal*, 1929) Keynes refused to perceive the shifts of purchasing power associated with international transfers. That the *process* of effecting these large transfers (laying aside for analysis their specific content) relentlessly over decades generated massive secular deflation and arrested growth was never recognised.

I shall close now, and go back to Chandavarkar's 'basic question', 'what triggered Keynes's interest in India?' which I have echoed. I am groping, without as yet a convincing answer to the question: *Why did Keynes write Indian Currency and Finance when he did, and for which he needed, so it seems to me but I may be mistaken, to rein in his objectivity*, and his grasp of, and sense of fairness to, history so eminently manifested in the *Treatise*?

Understanding Caste

Sukumari Bhattacharji

The Interpretation of Caste by Declan Quigley; Clarendon Press, Oxford, 1993; pp viii+184, Rs 250 (special India price).

THE book discusses the various interpretations of caste offered by scholars over the years but its primary concern is with the views of Dumont and Hocart, and some of their supporters, as well as the relation of caste to power. The author discusses the idealist interpretation of caste as a cultural construct, also the materialist interpretation of caste which he finds a rationalisation of more basic inequalities. He criticises both, pointing out their inadequacies and oversimplifications.

Caste, in the Indian context, covers both the four Varnas mentioned in the Vedas and, carried on still further in time, into jatis. Today the varnas have receded into history and only the jatis are relevant. The author probes the basis of the jatis and discusses in this context the views of Dumont and Hocart, et al. Although Dumont visualises a holistic society based on a purity-impurity hierarchy this view is shown to have serious limitations. The author quotes Raheja: "hierarchy is not stressed at all. What is stressed is the institutional and conceptual centrality of, the dominant caste, not the hierarchical superiority of the Brahman" (p 71). But since not all brahmans are priests nor all priests are brahmans this theory of hierarchy is not tenable. "Brahmans are fragmented into innumerable different castes which endlessly contest each others' status to the extent that some deny the Brahmanhood of others" (p 85). There are regional differences in the social position of the different castes. "...the aristocratic Rajputs might appear to be asserting the inferiority of most Brahmans"; this is Parry's view expressed in *Caste and Kingship in Kangra, 1979* (pp 105-06). Similarly some scholars' characterisation of the kshatriyas as warriors is fallacious; not all kshatriyas were warriors, many of them were nobles or 'rajanyas' who did not fight but constituted the nobility in the royal court.

What started as the varna division soon grew into caste or jati which latter resulted from (i) profession, (ii) inter-marriage, (iii) intermixture with invading people who were later assimilated into the body politic. What was obfuscated in many discussions was the relationship of these castes—which multiplied in arithmetical progression through permutation and combination—with the economic and political background. A very interesting instance is cited on p 18 "... caste organisation literally evaporates when one reaches a certain altitude in the Himalayas. The reason is not to do with altitude *per se* of course (but because) ...caste organisation depends on an agricultural surplus".

One cardinal issue which the author discusses throughout the book is the relationship of caste with power. The primary and earliest need, relevance and application of power arose from social chaos. Even the Mahabharata story of Prithu Vainya tells us that the first king was entrusted by the priests with the creation of order from the social chaos that prevailed. In other words he was empowered to discharge a specific function. And even the Mahabharata says that the first royal task he performed was setting the boundaries of caste. "Caste is a means of creating order through their (i e, kingship and kinship) combination where the alternative would be no order at all" (p 141). And "caste depends on the relative failure of kinship in shaping social institutions" (p 145). The king's task was to preserve a status quo in society, according to the order which had come about through the interaction of social, economic and political pressures, at least for a limited period before further permutation and combinations take place. In India, as in several other smaller countries the problem gained in dimension because here "the Sanskritic tradition has never been unified by any text or person" (p 166).

Caste, then, is integrally related to power and the author has shown how it is economic and political authority which empowered the king through the instrumentality of the priest. Power moved, changed hands, and changed its contours with the social exigencies. The brahman caste was not at the apex of the caste hierarchy, as political power rested with the king one of whose major obligations was to preserve the boundaries intact, to adjudicate when a new problem arose from the advent of invaders with no recognisable caste marks, to assimilate them within the existing paradigm, and to arbitrate when through change of profession or changed kinship relation a caste stood to lose its previous identity. The priests assisted the kings in these tasks, and power veered from royalty to ecclesia until a balance was struck.

The book is short (pp 169) but it excellently argues its position through refutation of some views and endorsing others after critically weighing their validity. Its strength lies in showing caste as historically transcending kinship, and as the first step in the division of labour. Also by connecting it with its economic and political roots. With diagrams, it illustrates many of its discussions and strengthens them. It is a real contribution towards understanding the problems of caste in India.

Economic Reform: India and Elsewhere

Lance Taylor

If South Korea shows that the state can effectively intervene in the economy, the examples of Chile, Argentina, Mexico and Turkey suggest that an attempt by the authorities not to intervene and turn all decision-making over to the market can backfire for a variety of reasons not just confined to the sphere of economics.

What will happen in India of course remains to be seen. But in the absence of good monsoons for the next two or three years, sustained export growth over the same period and an investment recovery led by the state, the chances of success of the current reform attempt cannot be rated very high.

'MARKET friendly' economic reforms are being implanted all over the developing world. In India and elsewhere, economic liberalism (in the 19th century Manchester and 20th century European sense of the word) is the doctrine of the day. Indeed, liberal policy packages were imposed 'elsewhere' some years before they arrived in India, which means that morals can be drawn from other countries' experiences about prospects for the reform programme here. With due reservations about the complexities of the Indian scene, I would like to point to a few such lessons in this presentation.

By way of background, it makes sense to begin by looking at the intellectual origins of the 'Washington consensus' reforms which the Bretton Woods institutions (the World Bank and the International Monetary Fund) and their allies recommend here and elsewhere.[1] The consensus reflects thinking common in the industrialised economies for the last few decades, brought on by stagnant real incomes and worsening distributions since about 1970. Over the same time span, social cohesion has declined, and no successors to national projects such as building up welfare states after World War II have emerged.

In the United Kingdom and United States, classical liberalism was soon proposed as a solution for the prevailing political and economic malaise (without strongly favourable results to date, but that is another story). The doctrine found articulate spokespersons such as Margaret Thatcher and Ronald Reagan, and their message reverberated worldwide. Its transmission has been abetted by 'globalisation' of industrial and finance capital (especially the latter), the collapse of the socialist (or, better, pseudo-socialist) alternative mode of economic organisation, and the deep reverence for market systems that characterises most of the economics profession.

For developing economies, Washington consensus policy packages all around the world take on similar characteristics, whether they are applied in Mexico, Zimbabwe, the countries of the former Soviet Union, or India.[2] They try to assure economic 'reform' with pay-offs in the form of faster output growth and rising real incomes by first 'stabilising' the macro-economic system and then 'adjusting' the market so that it can perform more efficiently.

The stabilisation exercise is based on policy tools that have been wielded consistently by the International Monetary Fund for the last 40 years.[1] They include:

—fiscal and monetary austerity aimed at restricting aggregate demand, e g, tax increases, cuts in public spending for both current purposes and capital formation, high interest rates, and credit restraints (especially for the public sector);

—devaluation (or weakening) of the local currency by increases in the rupee/dollar exchange rate, aimed at stimulating exports and restricting imports;

—other relative price shifts, such as changes in the agricultural terms of trade and reductions in the real wage; and

—income redistributions (typically unequalising, or regressive) in support of all of the above.

As we will see in discussing country experiences later, the main impact of these policies is to generate an output recession. The resulting production downturn will almost certainly improve the external trade account and devaluation may even lure in capital inflows (as appears to have been the case in India in the early 1990s). The IMF's chief target has always been to rectify an 'unsustainable' external balance, and its policy package usually hits that mark. Whether it reduces inflation (sometimes) or leads to renewed, equitable economic growth (rarely) are altogether different questions.

In the Washington consensus's division of labour, economic adjustment is mostly managed by the World Bank. The institution was taken over by liberals early in the 1980s; since then its main policy thrust has been to improve the allocative efficiency of the price system, in the sense that all 'wedges' between prices for similar commodities in different markets should be removed. For example, producer output subsidies and consumer purchase subsidies for food should be eliminated; furthermore, domestic food prices should be driven toward border prices (import or export dollar prices times the exchange rate). More generally, internal relative prices of traded goods should be the same as world relative prices. Labour market 'distortions' such as minimum wages should be removed, and rates of return (corrected for risk) of holdings in all financial markets should be equalised.

The Bank's belief, supported by innumerable exercises in neoclassical economics, is that creating allocative efficiency will lead to greater productive efficiency as well. The unregulated invisible hand will make the economy utilise its resources optimally, and on average everybody will be as well off as they can be. Note in passing the ahistorical nature of this assertion. It boils down to a theorem of Newtonian physics reinterpreted to describe how economic 'agents' allegedly behave (with optimality proofs provided, on the whole, by the second-rate applied mathematicians who have dominated neoclassical economic theorising for the past few decades). In no sense does the Bank extract its ideas from observed economic experience. As will be seen, its predictions about the efficiency improvements that liberal policies are supposed to assure are often wildly inaccurate.

In detail, adjustment packages typically include the following policy moves:

—liberalisation of foreign trade, beginning with replacement of import quotas by tariffs, and subsequent reduction of the tariffs and export subsidies;

—simultaneously or a bit later, liberalisation of the external capital account to facilitate cross-border financial flows;

—deregulation of the home financial market, aimed at equalising asset rates of return, as discussed above;

—deregulation of labour markets and decontrol of business decision-making;

—tax reduction and rationalisation; and

—privatisation, which is based on the idea that privately owned enterprises are intrinsically more efficient than firms owned by the state. In practice, selling off state-owned firms often amounts to a fiscal stopgap to close budget deficits opened by rapid tax reductions.

To inquire about the effects of these policies, one can ask two sorts of questions:

Have 'successful' developing economies relied on a liberal economic policy mix?

Where the Washington blend has been applied, has it generated economic 'success'? Why or why not?

We can sketch answers to the latter questions by reviewing experiences in places where the Fund and Bank have had a major say in economic policy formation. Because they help shed light on the Indian scene, we restrict our observations to a few semi-industrialised country case histories: Chile, Argentina, Mexico, and Turkey.[4]

Chile is usually considered the number one success case for liberalism, on the basis of its rapid, export-led growth since the mid-1980s. However, it is worth noting that the country went through a very long transition toward the free market under a very tough military government—General Pinochet took office in 1973. Despite their use of the best IMF medicines, he and his economic team did not succeed in stabilising inflation and curtailing output losses until exports took off. In other words, stabilisation did not come before adjustment (and in fact depended on the latter), contrary to the usual Washington chronology.

Looking backward, many Chileans now say that their current rapid growth justifies the dozen years they spent in the politico-economic desert. But had they been able to look forward in 1973 with foreknowledge of the difficulties that reform would create, it is not so clear that they would have chosen to take the free market path. Even after several years of robust output expansion, real income levels for most households are not far above their levels of 1970, as an initially unequal income distribution has become strikingly worse.

Moreover, Chile's path was not fully guided by the free market. The public sector invested heavily in copper mining (the once dominant, and still important export sector). For decades prior to their growth spurts, it intervened to support the new export industries, via cheap credits for planting and public investment in forestry and paper projects, technical support for new varieties, quality control, etc, in fruits, and enforced mergers and corporate restructuring in fisheries. The new Chilean way is certainly via capitalism, but it combines strong elements of public and private sector partnership veiled by free market rhetoric.

The same sort of rhetoric also dominates on the other side of the Andes mountains, in Argentina which has been growing rapidly since 1991. Inflation there was slowed dramatically by a non-IMF package combining austerity with frozen money wages and exchange rate (the peso was pegged one-to-one with the dollar in a new Constitution), and a good deal of government arm-twisting applied to enterprises to keep their mark-ups down. Luckily for its designers, this package was imposed just when interest rates were cut sharply in the US, leading to substantial repatriation of capital flight after the Argentine bourgeoisie had spent a decade building up nest eggs abroad. Since it owed most of the foreign debt built up in the 1970s, the government's budget benefited greatly from reduced interest obligations. By cutting interest rates, American Central Bank Governor Greenspan was far more useful to Argentina than Treasury Secretary Brady with his debt rescheduling schemes.

Growth in Argentina has been consumption-led. Repatriated resources have been invested in financial markets at home, which have generated substantial capital gains in peso terms as foreign exchange continues to flow in. This new wealth has mostly been directed toward higher household purchases, with a big import content financed by the continuing capital inflow. Levels of new physical capital formation remain low. If capacity limits do not begin to bind, the model can continue to work so long as Argentina maintains inflows of external finance. However, that may prove difficult as a degree of residual inflation increasingly strengthens the real value of the peso, thus facilitating still higher imports. In the absence of currency devaluation (precluded by the Constitution), there is an ever-increasing risk of renewed capital flight. Maybe an export miracle or a burst of external generosity will keep the balance of payments under control, but I would not bet heavily on that outcome over the next couple of years.

Mexico resembles Argentina, except that the economy is stagnant, after intensive Bretton Woods treatment since the debt crisis of 1982. Financial speculation is flourishing but income distribution has become substantially more unequal. For the past few years, Mexico has had a trade deficit on the order of 5 per cent of GDP (financed by renewed capital inflows, as in the rest of Latin America), which it has used to support *negative* output growth. In the 1970s, similar trade deficits were associated with output growth rates of 6 per cent or more.

The root cause of this problem is a private investment collapse, in part because Mexican authorities have had to maintain high real interest rates to keep money flowing in from Wall Street. Moreover, public investment which historically stimulated or 'crowded in' private capital formation has been reined in according to the Washington view. National saving has gone down as well, even more than in Argentina where at least the consumption boom has supported local economic activity.

Supposedly the enactment of the North American Free Trade Agreement (or NAFTA) in late 1993 would kick off a Mexican investment boom, but that has not happened so far. Instead, the threat that massive maize imports under NAFTA would wipe out the livelihood of small farmers making up 5-10 per cent of the population was one of many factors contributing to the revolt in the largely tribal (in Indian usage) state of Chiapas. The uncertainty provoked by Chiapas and the assassination of the official party's presidential candidate will hold down private capital formation for a long time to come.

Closer to the subcontinent geographically (and not so far distant in terms of social structure), Turkey was once considered an orthodox miracle. Its exports shot up in the early 1980s after a fairly standard stabilisation supported by ample capital inflows responding to geopolitical factors. The new economic team cut real wages, peasants' incomes via adverse shifts in the terms of trade, and government spending. The country had built up an industrial base over decades of inward-looking policies, and with depressed internal markets these producers started to look abroad. By happenstance, demand boomed in the region thanks to the 1979 oil shock and then the Iran-Iraq war. Aided by currency depreciation and ample subsidies (up to one-third of the value of foreign sales), exports and output grew rapidly through the mid-1980s.

For several reasons, the miracle unravelled soon thereafter. In an allegedly liberalised economic environment, the provision of state support to enterprises was taken out of the hands of a relatively fair bureaucracy and relocated in the prime minister's office. Pay-offs and 'rents' (the returns garnered from an assured market position, for example, the possession of an import quota) were passed out politically, angering elements of the entrepreneurial class left out of the largesse. More ominously, workers and peasants reacted against their income losses, and forced massive wage increases and pro-agriculture shifts in the terms of trade in the late 1980s. The distributional framework for the miracle collapsed, and by 1994 the economy was in the midst of a "lively, entertaining financial crisis" in the words of my Turkish colleague, Korkut Boratav of the University of Ankara.

The bottom line of these vignettes is that when orthodox packages succeed (as to date in Chile), they do so thanks to contingent events and a substantial dose of non-orthodoxy. By creating distributional conflicts (at least latently and sometimes actively) and financial speculation as opposed to real investment, they run a strong risk of falling apart, in both the economic and political spheres. High interest rates to lure in foreign capital and a strong exchange rate to facilitate a trade deficit to accommodate the capital inflows make the prospects for investment-led growth that much worse.

Morals from these observations can easily be drawn for India, but before doing that it makes sense to address our first question above—have successful developing economies adopted the Washington model? In one important case—that of South Korea—the answer is clearly 'No'.[5]

The leitmotif of state intervention in South Korea has been the creation of an "independent economy... with sufficient technological capability to permit a reasonable living standard without a chronic balance of payments deficit". To arrive at their goals, Korean planners consistently co-ordinated macroeconomic and industrial policies, usually

giving the latter precedence. Instead of aggregate demand management, keeping up investment was the order of the day. Korea's emphasis on building up production capacity was accompanied by prudent fiscal policy, numerous measures aimed at holding down consumption, and ample credit creation targeted toward production sectors deemed 'priority' at any time.

The main features of Korean industrial strategy remained stable over the years. First, a theme continually developed in official documents was that "the market mechanism cannot be entirely trusted to increase competitive advantage by industries", so that branches likely to enjoy high productivity growth and/or income-elastic demand were to be promoted as "promising strategic industries". They were given custom-designed financial, technical, and administrative support. Picking winners turned out to be an operational concept in an economy like South Korea's (and, earlier, Japan's) which was not operating on world technological frontiers.

Corrective feedback to the selection process was provided by ongoing, broad reporting of activities of 'priority' firms to the government. The economic bureaucracy thus had access to detailed business information, which proved essential for effective industrial policy. 'Creative destruction' of obsolescent firms was assured by the government's use of its acquired knowledge to weed out inefficient production operations in successive waves of rationalisations, mergers and liquidations. Individual conglomerate firms (the famous chaebols) were clearly subject to discipline, even though as a group they had privileged access to state resources. Noise and static in dealings between the state and producers were reduced by the fact that apex organisations were engaged on both sides of the dialogue.

Second, in line with this strategy, intense effort was devoted to acquiring technology (a huge public investment in education was economically mobilised exactly in this fashion). For this reason, direct foreign investment was strictly regulated while foreign technologies were banned in sectors in which domestic counterparts were available. Firms were encouraged to practise reverse engineering, along with licensing and purchase of technologies not available at home—all under bureaucratic guidance.

Third, there was a consistent emphasis on attaining economies of scale. This goal was reflected in many mergers of small firms initiated or subsidised by the government, e g, in the chemical, automobile, fertiliser, and other sectors. There was an ongoing campaign to restrict entry and control capacity expansion in various sectors to curtail 'excessive competition' in the form of big swings in investment and price wars in industries with decreasing costs.

Fourth, within the generally expansionary macro-economic environment, credit allocation was aggressively practised. The banking system was nationalised early on, giving the state effective control over all important financial flows (aided by tight foreign exchange restrictions). 'Policy loans' with subsidised interest rates and/or priority rationing accounted for over half of bank credits in the 1960s and 1970s.

These features of Korean industrial planning suggest several conclusions relevant to economies such as India's. One is that there can be a bargaining solution among peak organisations to restrain rent-seeking, with rapid output growth and the state's power to punish recalcitrants in the background. Rents were certainly created for the chaebols by their privileged position, yet they became production powerhouses and not leeches thriving on public largesse. Moreover, they were effectively guided by the bureaucracy, since channels were created for it to get access to business information.

The economic bureaucracy itself was an essential Korean player. It was 'embedded' in the society in the sense that it could act autonomously for the public good as it saw fit, without completely being taken over by patronage and rent-seeking. From a rent-seekers' heaven prior to the Korean war, conditions were created for an effective bureaucracy to emerge.

The dialogue among the bureaucracy and the chaebol permitted Korea (along with other countries in east and south-east Asia, using similar institutions) to practise economic planning effectively in a capitalist environment. Short-term allocative efficiency ('getting prices right' along Washington lines) was often sacrificed to long-term productive efficiency or rapid productivity growth. Conscious rent creation on the part of the state was the key to constant industrial upgrading and realisation of economies of scale. In the long run, huge steel mills and shipyards made sense.

Finally, the institutional basis for the South Korean miracle was invented over a relatively short time. Chaebols, trading companies, the planning bureaucracy, and the macro-economic policy mix all emerged in the early 1960s in a creative burst. Obviously, such institutions cannot be transferred without modification to other national contexts, but partial functional equivalents may well prove relevant in India and elsewhere.

To summarise, if South Korea shows that the state *can* effectively intervene in the economy, the examples discussed earlier suggest that an attempt by the authorities *not* to intervene and turn all decision-making over to the market can backfire for a variety of reasons not just confined to the sphere of economics. The political coalition which backed reform in Chile, Argentina, Mexico, and Turkey was made up of the Bretton Woods institutions and other foreign actors, industrialists in a position to gain from liberalisation and an export push (by no means comprising the total of national firms), financial speculators, households in the top 10-20 per cent of the income distribution who could afford an ample array of new consumer goods in a liberalised trade regime, and a local economic technocracy which put the new policy packages in place.

The losers included people in the bottom 80 per cent of the distribution, some important industrialists, and old political elites. When reforms failed to take hold, the outcomes included novel forms of corruption practised by the beneficiaries of liberalisation, financial speculation, stagnant private capital accumulation (not stimulated by public investment which had been cut back), accelerating inflation pushed by distributional conflicts, lagging output, high interest rates, and an overvalued exchange rate. All these are familiar problems which market friendliness was supposed to overcome. When they did rear their heads, the reform coalition ran the risk of falling apart—it has done so already in Turkey, and Mexico and Argentina do not seem far behind.

What will happen in India of course remains to be seen. But in the absence of good monsoons for the next two or three years, sustained export growth over the same period, and an investment recovery which will probably have to be led by the state, I would not bet the family farm on the success of the current reform attempt. The appearance of exchange appreciation, distributional tensions, or a speed-up in inflation (already near the local political flashpoint) would make prospects considerably worse. On the other hand, a push toward sensible public investment policy and directed intervention as in East Asia would make a wager on an Indian growth miracle a much more appealing choice.

Notes

[Lecture delivered at the India International Centre, New Delhi, April 20, 1994 I am grateful to the United States Educational Foundation in India for making my visit possible]

1 The 'Washington consensus' label is due to John Williamson of the Institute for International Economics, a liberal Washington think tank.

2 Documentation has been built up over the years by several sources, including the World Institute for Development Economics Research (WIDER) in Helsinki. WIDER-based research underlies three monographs in which I had a hand: *Varieties of Stabilisation Experience* (Oxford University Press, 1988), an edited volume called *The Rocky Road to Reform* (MIT Press, 1993), and *The Market Meets Its Match* (Harvard University Press, 1994), co-authored by Alice Amsden, Jacek Kochanowicz and me.

3 For details, see the country studies summarised in *Varieties of Stabilisation Experience*.

4 More detail is available in *The Rocky Road to Reform* and more recent country papers prepared for WIDER.

5 Good descriptions of Korea's economic strategy are given by Alice Amsden, *Asia's Next Giant* (Oxford University Press, 1989) and Ha-Joon Chang, 'The Political Economy of Industrial Policy in Korea' (*Cambridge Journal of Economics*, 1993, pp 131-57) The quotations in the text come from these authors.

I cordially welcome you all to the 55th Annual General Meeting of the Company.

CONSOLIDATING THE PAST, BUILDING A BETTER FUTURE

The year 1993-94 was a year of high growth for your Company. Gross Turnover registered a new high of Rs. 509.82 Crore, an increase of 80% over previous year. Gross profit before interest and depreciation at Rs. 83.32 crore was 89% higher and Profit after tax more than doubled to Rs. 32.72 crore. The Earning Per Share increased to Rs. 10.14 on the substantially enhanced capital (average) as against Rs. 5.60 per share in the previous year. The Directors have recommended a Dividend of 30% on the increased equity capital.

Improved performance in all the divisions of the Company was achieved inspite of competitive market conditions and rising costs. This was possible due to the thrust on higher capacity utilisation, betterment of productivity factors, cost reduction measures, quality upgradation and focus on niche markets.

The source of our Company's strength has been the courage to take bold decisions with a future focussed vision and the will to succeed. Our strategy for leadership is to increase capacities, strengthen financial resources, lay emphasis on research and development, maintain highest standards of quality, and nurture human resources.

Keeping this in view, **an investment of Rs. 2000 Crore has been planned, of which Rs. 1000 Crore will fructify in the current year itself.** This will result in significant enhancement of our Paper and Cement capacities and consolidation of the Polyester Fibres and Magnetic Tape businesses.

I shall now dwell on the significance of two major changes in your Company.

Orissa Synthetics Ltd. (OSL)—co-promoted by us—was merged with the Company. This merger is a 'merger of strength', as this addition has already resulted in higher sales and profits, besides enhancement of asset-base and net worth of the Company. This will add a new dimension in our journey towards accelerated growth. Your Company is now well diversified being engaged in the manufacture of Paper, Cement, Polyester Fibre & Yarn, all core sector industries, and Magnetic Tape — an industry of the future. All of these are high growth industries.

Statement of Shri Hari Shankar Singhania, Chairman & Managing Director, at the 55th Annual General Meeting held on Saturday, the 6th August 1994

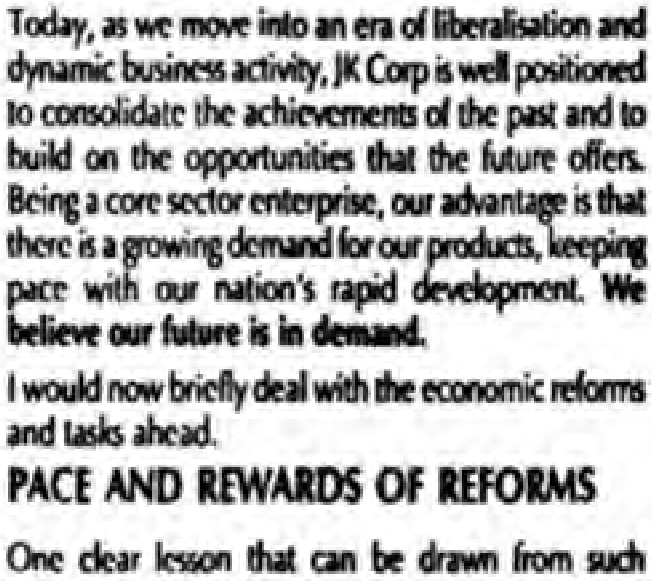
In order to appropriately reflect the Company's growing corporate size and its multi-dimensional business activities, the name of your Company has been changed to "JK Corp Limited" from Straw Products Ltd.

Today, as we move into an era of liberalisation and dynamic business activity, JK Corp is well positioned to consolidate the achievements of the past and to build on the opportunities that the future offers. Being a core sector enterprise, our advantage is that there is a growing demand for our products, keeping pace with our nation's rapid development. **We believe our future is in demand.**

I would now briefly deal with the economic reforms and tasks ahead.

PACE AND REWARDS OF REFORMS

One clear lesson that can be drawn from such economic reforms that have been launched is that there is a close connection between their pace and rewards. Where the reforms have been far-reaching, such as de-licensing of industries, a liberal attitude towards foreign investment and a realistic re-alignment of the external value of the Rupee, the overall results have been good. They are reflected in the performance of companies, in the flow of foreign



capital and improvement in exports. On the other hand, where the changes effected have been tardy, as in the case of restructuring Financial Institutions or downward adjustment of interest rates, or opening up of power, telecommunications and such crucial sectors, the effects have been marginal, if at all. And, in the areas where the reforms have not been meaningfully effective — running of public enterprises and maintenance of infrastructure, they constitute serious drag. A country's success or failure lies in the adequacy and quality of its infrastructure.

TASKS BEFORE GOVERNMENT & PRIVATE ENTERPRISE

Even in the most free of market economies, the macro-economic policies of Government influence the flexibility of product, labour and financial markets. In our own economy, the role of Government is both critical and crucial. High structural budgetary deficits and hikes in administrative prices pre-empt savings, increase prices and adversely affect business confidence. The tasks before our Government are many :

- to create and maintain a stable macro-economic environment with a consistent budgetary/monetary mix conducive to price stability and low short and long-term interest rates.
- to eliminate/curtail regulatory barriers that stand in the way of restructuring of enterprises.
- to help Indian private enterprise attain world class and compete in global markets.

Private enterprise in India also have to undertake many tasks. First and foremost every business entity must be more than ready to adjust itself to the new era which is already here. Over-worked though the term globalisation may already seem to some, it is becoming an increasingly accurate reflection of what is happening to business the world over. It means not only the deepening of integration between national economies but also the spread of that process over ever larger parts of the world. The global village and global market place are a reality. No country and no business enterprise can be sheltered from the winds of change.

I would now like to review the various businesses of the Company.

PAPER

JK Paper Mills

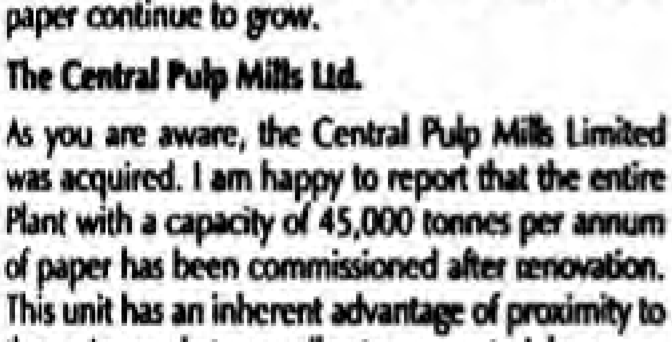
The Paper Mills had yet another year of over 100% capacity utilisation. Thrust on product-mix optimisation through value addition and quality upgradation ensured the creation and sustenance of niche markets. The new Speciality Paper Machine which is scheduled to be commissioned shortly, will increase the capacity to 75,500 tonnes per year. With the commissioning of Chlorine Dioxide bleaching by the end of the year, further improvement in product quality will be achieved. New investment programme is on hand for increasing Paper capacity to 1,15,000 tonnes per year along with Pulp Mill expansion and augmentation of captive power.

A NEW IDENTITY, FOCUSSED VISION

JK Paper Mills is now well entrenched as a leading manufacturer of high quality papers. This is evidenced by your Company being the largest manufacturer of Copier Paper in the country and having significant market shares of watermarked Bonds, Air Mail, Surface Sized Maplitho and the Enamel Board. During the year, new grades of paper were introduced including "JK Laser", for the first time in the country. Exports of select grades of paper continue to grow.

The Central Pulp Mills Ltd.

As you are aware, the Central Pulp Mills Limited was acquired. I am happy to report that the entire Plant with a capacity of 45,000 tonnes per annum of paper has been commissioned after renovation. This unit has an inherent advantage of proximity to the major markets as well as to raw material sources. **This acquisition would bring the overall capacity of the two units to 1,60,000 tonnes per annum which represents more than two and a half times increase in our existing capacity.**



Industrial Plantations

While the long term growth prospects for the Paper Industry are good, the Industry has to gear itself to meet the demand by adequate planning of capacity. One of the major difficulties encountered in this is the absence of a progressive government policy for industrial plantations of renewabel pulp wood. It is imperative that urgent steps are taken to ensure that adequate raw material for the Paper Industry is available through such plantations. Imports of pulp and waste paper to supplement raw material needs cannot be a permanent and long term solution as they are a drain on the country's foreign exchange resources.

CEMENT

Lakshmi Cement

Lakshmi Cement achieved a higher production of 5.57 lac MT of Cement during the year. Cement demand in the country, though higher than the previous year, grew at a slower pace than earlier years. Generally, cement prices remained depressed. The Industry is hopeful of a much improved situation in the coming year as construction activities gather momentum.

Inspite of cost increases, margins at Lakshmi Cement have improved over the previous year due to higher productivity, better efficiencies and cost reduction. In recognition of its excellent quality conforming to International Standards, it has been awarded ISO 9002 quality certification. Lakshmi Cement also bagged the shield for the best overall performance in the region.

The Company's Cement capacity is being increased from 6 lac tonnes to 15 lac tonnes per annum at the existing location. Erection of the plant is in full swing and the project is expected to be completed by the end of the year. The Project is being partly financed under a World Bank Line of Credit. It is proposed to raise the capacity further to 20 lac tonnes per annum.

J.K. Udaipur Udyog Limited (JKUUL)

You are aware that JKUUL was promoted by your Company for acquisition of Udaipur Cement Works from Bajaj Hindusthan Ltd. as a going concern. The acquisition was completed on 1st December 1993. I am happy to report that within a short span, production has doubled and power and fuel economies achieved. The installed capacity of the unit is slated to go upto a level of 10 lac tonnes per annum. To meet the cost of technology upgradation and capacity expansion this company proposes to make a capital issue shortly.

The combined capacity of the two units would thus go up to 30 lac tonnes per annum — a five fold increase.

POLYESTER FIBRES

Orissa Synthetics

The year 1993-94 witnessed a significant increas in off-take of polyester fibre and yarns. Th performance of Orissa Synthetics was distinctly bette than the industry average and it achieved 100% rated capacity.

On the export front, the division was awarded th Top Exporter's Award for the year 1992 in succession I am happy to report that Orissa Synthetics is th first unit in the entire Polyester Industry to hav received ISO 9002 Certification for its entire rang of products. Polyester has emerged as a high-growt Industry for the next decade. Our capacity is bein increased from 21,000 tonnes to 30,000 tonnes pe annum during the current year.

MAGNETIC TAPE

JK Magnetics has carved for itself a place among th largest integrated manufacturers of internationa quality tapes in the country. Quality acceptance b recording companies affiliated to international label and the recent encouraging beginnings on Export are indices of the unit's progress. Production ha increased three-fold in the last four years and nov the Company has a market share of 26% in audi pan cakes.

ACKNOWLEDGEMENTS

Before I conclude, I would like to express m sincere appreciation of the contribution of th employees at all levels in the continuing growth o the Company. I would also like to acknowledg continued co-operation and support given to th Company by the Financial Institutions, Banks Government authorities, shareholders, distributors dealers and last but not the least, the customers.

Thank you.

This does not purport to be a report of the proceeding of the Annual General Meeting.

JK CORP LIMITED

(Formerly STRAW PRODUCTS LIMITED)

Our future is in demand

LAKSHMI CEMENT

Orissa Synthetics

JK MAGNETICS

Mass Conversions to Hinduism among Indian Muslims

Yoginder Sikand
Manjari Katju

In cases of mass conversion of Muslims to Hinduism, the central thrust has been on their de-Islamisation rather than on their accepting the Hindu religion. The Muslim castes which have been particularly vulnerable to Hindu missionary efforts have been those which are only nominally Muslim and retain many Hindu customs and beliefs. Most of the mass conversions have occurred among Muslim Rajput groups. The Hindu missionaries, too, have shown an inordinate interest in converting the socially dominant and powerful Muslim Rajputs and not the 'lower' Muslim castes who form the majority of the Indian Muslim population. Finally, the mass conversions have mostly occurred in the backward regions of northern India where feudalism is still largely intact and where brahminism has not been challenged by assertive 'lower' castes.

THE origin of the term 'Hindu' can be traced to the ancient Persians who employed to refer to the inhabitants of India who were unified not by belief in any single set of religious doctrines but by membership in hierarchically arranged 'jatis' (castes) which collectively formed what was known as the 'varna vyavastha' (caste system). What today goes under the name of the 'sanatan dharma' (Hinduism) refers essentially to the duties and rights of individuals as members of castes into which they are born, the dharma of each caste being different. Hence, caste, and not any common set of religious beliefs and customs, forms the bedrock of the Hindu religion and social order.

Unlike, for instance, Islam and Christianity, Hinduism lacks any creed which non-Hindus are required to accept in order to enter the Hindu fold. Theoretically, since birth in a particular Hindu caste alone qualifies one to be considered a Hindu, non-Hindus cannot convert to the sanatana dharma. However, the spread of Hinduism from the Hindu heartland of 'aryavarta' (the Gangetic belt of north India), not only to the rest of the subcontinent but even to far-off Indo-China, Malaysia and Indonesia in ancient times suggests that in actual practise it has been possible for non-Hindu groups to be Hinduised. This Hinduisation process is, in fact, still under way among many aboriginal and other non-Hindu groups in India who are outside the pale of the caste system.

Hinduisation Process

Till recently, the process of Hinduisation proceeded in a completely unorganised fashion. Typically, itinerant brahmin priests would venture off into non-Hindu domains and establish mutually supportive relationships with the ruling chieftains of those areas. The priests would confer upon them the exalted status of kshatriya (warrior caste) and, in turn, the chieftains would recognise the brahmins as their spiritual preceptors and would grant them extensive landholdings as well as other forms of state patronage. Gradually, the brahminical values, customs and beliefs would then filter down from the chieftains to their subjects leading to their eventual Hinduisation and their absorption into the caste system, mainly as sudras (untouchables and menial castes).

Today, however, this unorganised Hinduisation process is being supplemented with planned and organised missionary efforts of such groups as the Arya Samaj, the Vishwa Hindu Parishad (VHP), the Rashtriya Swayamsevak Sangh (RSS), the Ramakrishna Mission, etc. These outfits do not restrict themselves merely to the propagation of religious tenets, but also run a network of schools, dispensaries and community-service centres for many of the non-Hindu groups among whom they are proselytising.

Traditionally, Hinduisation of non-Hindu groups occurred in a very gradual fashion over a long period of time, sometimes extending over several generations. This was because it was essentially an extended process of cultural transformation. In this sense, therefore, it would not be entirely proper to speak of 'conversion' to Hinduism since non-Hindus admitted into the Hindu caste system were not required to accept any particular set of beliefs and customs as a precondition. What Hinduisation did entail was the acceptance of certain brahminical notions, such as the Karma theory, belief in the supremacy of the brahmin caste and observance of the rules of caste purity and pollution. Non-Hindus gained entry into the Hindu fold through this acculturation process which occurred alongside their accommodation within the caste system.

Unlike, for example, in Islam, where non-Muslim individuals and groups become Muslims immediately upon their recitation of the Islamic creed, in Hinduism, which lacks a set of fundamental tenets binding upon all its followers, entry of non-Hindus cannot be instantaneous. Hence, 'conversion' to Hinduism occurred as the result of a long process involving not the acceptance of any particular religious doctrine but, rather, the imbibing of brahminical cultural norms legitimising the caste system. This went along with the discarding of customs incompatible with these cultural norms.

This gradual process of Hinduisation through cultural change is, however, today being added to by Hindu missionary groups which conduct 'shuddhi karan' ('purification rituals' or conversion ceremonies) of non-Hindus, who become Hindus immediately upon the completion of the initiation rites.[1]

In India the closest ties that an individual has are with members of his or her own caste or jati. The jati is an endogamous, commensual unit affording security as well as an identity to its members. Membership of a jati is restricted only to those who are born into it. It is difficult, if not impossible, for a Hindu to exist in isolation from his or her own particular jati. Hence conversions in India to or from Hinduism (or any other religion for that matter) generally take the form of mass conversions. Entire jatis convert together instead of isolated individuals changing their religious allegiances. Today, however, the Arya Samaj, a neo-Hindu outfit, arranges for both individual as well as mass conversions. Non-Hindus getting married to Hindus now can, and, indeed, often do, convert to Hinduism through the Arya Samaj. This is a very recent development, which the 'sanatani' (orthodox) Hindus frown upon since the Hindu scriptures explicitly proscribe inter-caste and inter-religious marriages.

The vast majority of India's over 120 million Muslims are descendants of low-caste Hindus who converted to Islam to escape from the oppression of the higher

castes and in search of equality and dignity. Rarely did individuals convert by themselves, for that would have meant completely cutting off their ties with their castes. Hence, entire caste groups embraced Islam together and then adopted a new, Islamised or Arabic caste appellation for themselves. For instance, the tantis (weavers) of Bihar began to call themselves ansaris after becoming Muslims. In Punjab, the musallis bhangis (sweepers) adopted the more respectable title of Musallis. In all these cases, the endogamous caste unit which was in existence prior to conversion, remained intact even after that. This is how Muslim society in India has come to be characterised by a multiplicity of endogamous caste groups. As shall be discussed later on, it is the existence of castes among the Indian Muslims that allows for the process of Hinduisation to operate among them.

Hinduisation of Indian Muslims

Conversions of Hindu castes to Islam for social emancipation from the shackles of the caste system proceeded steadily so long as the Muslims were politically dominant in India. Thereafter, with the establishment of British rule, this process slackened considerably. In the early years of the present century the British rulers began instituting political reforms granting Indians a certain measure of self-government. These new opportunities, such as limited voting rights and representation on local body councils, were apportioned among the various religious communities of the country in accordance with their respective numerical proportions. The Hindu 'upper' caste elite, forming not more than 6 per cent of the then Indian population, represented a numerically relatively small, yet enormously powerful, minority. In order to corner the benefits of the British-instituted reforms, this minority group felt it imperative to enhance the Hindu numerical strength. The only way it could do so was by incorporating into the Hindu fold the untouchables, the aboriginals and other non-Hindu groups. The conversion of these non-Hindus, therefore, clearly represented a political strategy to employ the power of an artificially constructed "Hindu majority community" to bolster the fortunes of the 'upper' caste Hindu minority.

As one perceptive scholar observes,

> There is hardly any region in the subcontinent in which 'Hindus', as they defined themselves before Gandhi attempted to co-opt or incorporate all Untouchables communities into the 'Hindu', fold, represented a cohesive or clearly identifiable 'majority' community... The conjuring up of this concept can be seen as nothing more than another attempt by one elite minority or coalitions of elite minorities to dominate all others.[2]

Hence, the organised efforts by 'upper' caste Hindus to proselytise among the untouchables (who, being outcastes, were considered to be outside Hindu caste society) and among Muslims and Christians cannot be seen in isolation from the wider political context since political considerations played a very crucial role in the entire enterprise.[3] This continues to be the case to this very day.

Orthodox, or sanatani, Hindus held that it was not possible for non-Hindus, whom they considered 'impure' ('ashuddh') to become Hindus. It was the Arya Samaj, a revivalist neo-Hindu outfit set up in 1875 by a Gujarati brahmin, Dayananda Saraswati, which broke from orthodoxy in this regard. It allowed for non-Hindus to convert to the Arya Samaj sect through a ritual known as the shuddhi karan ('purification') ceremony.[4]

'Shuddhi' ('purity') is said to be an ancient and central concept in Hinduism. It refers to a state of ritual 'purity' needed for the performance of one's dharma, the central component of which is observing the duties assigned by the brahminical scriptures to one's caste. Since dharma has both ritual as well as social dimensions, shuddhi refers to the state of 'purity' required for the performance of both religious rites and social intercourse.

Shuddhi may be lost by 'pollution', which may occur through a death or birth in one's household or by the touch of 'polluted' materials or 'impure' people. Shuddhi Karan refers to the rite through which this 'pollution' is considered to be removed and ritual 'purity' restored, thus enabling one to regain one's caste status.[5] As an orthodox brahmin 'pundit' opines:

> The abandonment of prohibited food, separation of contact with low persons, and living in one's situation according to *Varnasrama dharma* (caste-system) is called *Suddhi*.[6]

The shuddhi karan rite seems to have been formulated in the 19th century only, though efforts were made to bestow upon it an ancient history.[7] It first made its appearance in the context of 'upper' caste Hindus who lost their caste for having crossed the seas. The ban on travelling abroad had been imposed by Hindu scriptures for fear of 'upper' caste being unable to observe the rules of the maintenance of caste 'purity' in foreign lands. With the establishment of British rule in India many 'high' caste Hindus went to England for higher education. For this, they were excommunicated from their castes but now could seek re-admission after undergoing a 'purification' ceremony. It was this newly-invented ritual that later came to be used to convert untouchables and other non-Hindu groups to Hinduism.

Prior to the mass conversions of certain Muslim groups by the Arya Samaj, there had been isolated instances of individual Muslims undergoing the Arya shuddhi karan ceremony. Most of these early Muslim conversions to Hinduism were, however, cases of Hindu converts to Islam reconverting back to Hinduism.[8] The first instance of the conversion of a born Muslim to the Arya Samaj was reported in 1877 when Dayananda Saraswati performed the shuddhi of a Muslim of Dehra Dun, giving him the Hindu name of 'alakhdhari'.[9]

The mass conversions of Muslims to Hinduism assumed significant proportions only in the 1920s, in the backdrop of concerted efforts by the Muslim and Hindu elites to inflate their numbers so as to enhance their political bargaining power. The Arya Samaj was particularly successful among Muslim groups which were only partially Islamised and had still retained many of their old Hindu customs and beliefs. Thus, for instance, the sheikhs of Larkana (Sind), a low half Muslim-half Hindu caste, were converted by the Sukkur unit of the Arya Samaj as early as in 1905. Similar was the case with the subrai labanas of Ludhiana (Punjab) and the maiwaris of Ajmer (Rajputana), who, like the Larkana sheikhs, followed a curious mixture of Hindu and Islamic practices.[10]

It is interesting to note that these group conversions to Hinduism organised by the Arya Samaj entailed essentially the giving up of a certain Islamic customs such as the burial of the dead, 'nikah', the visiting of 'dargahs' and circumcision, rather than the imparting of Hindu religious knowledge to the new converts.[11] This was possibly because the shuddhi movement was motivated far less by the desire to promote spirituality and moral and religious values than by strong anti-Muslim passion.

Conversion of Malkanas and Jats

The Arya Samaj claimed to be opposed to the caste system based on birth. However, it is interesting to note, that in the case of the mass conversions of entire Muslims groups to Hinduism a crucial component of the Arya Samaj missionary strategy was first to construct an artificial history of these groups as being the descendants of 'upper' caste Hindu kshatriya warriors who were forcibly converted to Islam. It then sought to win them over by instilling in them a false pride in this constructed caste identity, promising them the restoration of their 'upper' caste privileges if they were to de-Islamise themselves. All Muslims, including those of 'upper' caste Hindu descent, were treated by orthodox Hindus as 'unclean' and 'impure' ('achchut' or 'ashuddh') and hence, for Muslim castes of imputed kshatriya descent, conversion to Hinduism seemed to offer a means to regain many of their caste privileges which they had lost on becoming Muslims. Appealing to the caste sentiments of Muslim groups, therefore, played a crucial role in the Arya Samaj's missionary successes. Indeed, this remains the basic missionary strategy of Hindu missionaries even today. For instance, the present head of the Vishwa Hindu Parishad, asserts:

The Muslims and Christians of this country were made to forget their Hindu identity, yet their lesser identity is still meticulously preserved securely. Till this day they can recall from which particular caste they were converted and in most cases they continue to maintain their caste identity. This identity alone will, in the future, become the means for them to recognise their Hindu identity, as a result of which the large numbers of those who have been cut off from Hinduism will come back into its fold.[13]

The appealing to caste sentiments formed, as in all other similar cases, the basis of the most controversial of the Arya Samaj's mass conversions—the shuddhi of the Muslim malkana rajputs of the western districts of the United Provinces in the 1920s.

The term 'malkana' is not a clan name, but is a title derived from the word 'milkiyat' or ownership of land. The malkanas are said to have been nominally converted to Islam under the Afghan rulers from whom they received extensive land grants in the Jamuna tract in the neighbourhood of Agra, Mathura and Delhi. They claimed to be the descendants of the Jadun rajputs, though some of them are also said to have possessed Agarwal bania and tarkar brahmin ancestry.[13] The malkanas followed both Hindu and Muslim customs, because of which they were also known as adhbariya ("half Hindu-half Muslim"). Yet in the censuses they tended to return themselves as Muslims.[14] Their population in the 1920s was said to number several hundred thousands.[15]

Efforts to convert the malkanas to Hinduism began in the first decade of the present century when shuddhi sabhas were set up at various places in the United Provinces by Pandit Bhoj Dutt Sharma of the Arya Samaj. In 1907 the Hindu rajputs of the Agra division flocked to these *sabhas* in an attempt to convert the Muslim rajputs so as to thereby enhance the numerical strength of the rajput community.[16] By 1910, the Rajput Sabha, which was, along with the Arya Samaj, actively engaged in the shuddhi movement, claimed to have converted 1,052 rajput Muslims to Hinduism.[17]

It was, however, only in the 1920s that the dramatic mass conversions of malkanas began. The first of these conversion ceremonies took place at Raibana, near Agra. Within the first few months of 1992, over 5,000 malkanas were said to have been Hinduised and the figure rose to over 30,000 by the end of the year.[18] This drive continued till 1927 or so, by which time it js reported that about 1,63,000 malkanas had entered the Hindu fold.[19]

In the conversion of the malkanas, the Arya Samaj was actively assisted by the Kshatriya Upkarini Mahasabha (Rajput Welfare Society). On August 30, 1992, the Mahasabha at its meeting at Kashi under the presidentship of Raja Sir Rampal Singh, decided "to take back Hindu rajputs who at one time or another had turned Muslims".[20] The Mahasabha sought to win over the Muslim rajputs by repeatedly playing up the issue of their upper caste kshatriya ancestry. That the Arya Samaj had to seek the active co-operation of the Mahasabha suggests that despite its professed disavowal of the caste system, the Aryas did not hesitate in making as their central missionary strategy the evoking of caste sentiments.

In the conversion of the malkanas the primary aim of the Arya Samaj seems to have been their de-Islamisation so as to decrease Muslim numbers. It is also evident that the Arya Samaj was not particularly concerned about instructing the new converts in the principles of the Arya faith. Instead, the malkanas seem to have been rehabilitated, at least partially, as Hindu kshatriyas. As Chinmayananda Sanyasi, an active Arya missionary, admitted,

> The malkanas do not become Arya on shuddhi but go to their community (Rajput) which is mainly sanatanist (orthodox).[21]

That the Hindu rajputs' active role in converting the malkana rajputs was spurred more by an interest in increasing their numbers rather than by a genuine sense of brotherhood is evident from the fact that even today the Hindu rajputs refuse to inter-marry with the malkanas.

The jats are a peasant community inhabiting north-western India, including parts of present-day Pakistan. The jats of western Punjab are, by and large, Muslims, those of central Punjab being Sikhs and those of the eastern districts mostly Hindus. However, in the Haryana region of the then province of Punjab, particularly in the Rohtak division, there lived a significant number of neo-Muslim jat cultivators known as the Mula jats. This community soon became the focus of the Arya Samaj's missionary efforts.[22]

By 1921, Rohtak had emerged as a major centre of the Arya Samaj movement. Nearly 90 per cent of the registered Aryas of this region were drawn from among the Hindu jats. Chhotu Ram, the leading jat politician, who had a strong base among the jat peasantry of Rohtak, was a staunch Arya Samaji and was the main force behind the shuddhi of the mula jats. At his instance, resolutions were passed by various Hindu jat panchayats of the Rohtak division calling for the conversion of Muslim jats. On November 12, 1925, a resolution to the same effect was passed by a massive gathering of Hindu jats at the pilgrimage town of Pushkar near Ajmer, which was presided over by Maharaja Bijendra Singh, the jat ruler of the Bharatpur state. By 1927, under Chhotu's influence, even the jat mahasabha, the leading jat organisation, had become actively involved in the shuddhi movement. In the same year, a committee presided over by Choudhry Ghasi Ram, a member of the Punjab Council, was set up to promote the conversion of the mula jats. Chhotu Ram was appointed as its joint-secretary.

Chhotu promised the mula jats that they would be fully accepted by the Hindu jats if they were to renounce Islam. A resolution was passed during the course of a meeting held at Rohtak on April 8, 1923, in which it was declared that,

> *Shuddh-Shuddha* ('purified') Jats will be fully integrated into the Jat Community. No Jat is to discriminate against *shuddh-shuddha* Jats in any matter of eating, socialising or marriage alliances.[23]

Despite Chhotu Ram's efforts to integrate the Hinduised mula jats into the broader jat community, the Hindu jats seemed unwilling to accept them.[24] The shuddhi of the mula jats, therefore, proved a failure and many of them were reconverted back to Islam through the efforts of the Isha'at-e-Quran and the Tabligh-ul-Islam, Muslim organisations set up in 1923 with the aim of rescuing Muslim jats, gujjars and rajputs who had been converted to Hinduism by the Arya Samaj.[25]

As with the conversion of the malkanas, the shuddhi movement among the mula jats, in which the politician Chhotu Ram played the key role, was undertaken more for political gain than out of any genuine spiritual commitment. Chhotu's personal interest in ensuring the success of the movement lay in his concern for increasing his own jat political support-base. As his biographer observes:

> It needs to be emphasised that Chhotu Ram was not interested in the shuddhi movement, as some other Arya Samajists were, in claiming back some Hindus of lower caste who had embraced Christianity or Islam in the Haryana region. He only worried lest the numbers of Hindu jats got dwindled by their conversion. Pointing to the dwindling number of Hindu jats in the population of Punjab, Chhotu Ram advocated wide-scale shuddhi of the mula jats (Muslim jats) as one of the ways in which it could be over come... In fact, the failure and success of the entire shuddhi movement was measured by the Chhotu Ram in relation to the addition it was likely to make to the total number of Hindu jats. The numerical strength of any "community" was necessary in the Punjab of Chhotu Ram's days as that alone gave the 'Community' a leverage to make claims to the government for allocation of jobs, rewards, patronage, etc. *Chhotu Ram's interest in and advocacy of shuddhi in relation to jats alone substantiates the theory that he was acting not for the sake of 'Hinduism' but 'jatism' to maintain the numerical strength of jats, and to increase it, if possible.* Significantly, Chhotu Ram was advocating the readmission of the purified jats into their own jat biraderi (caste-brotherhood) not as Aryas but as jats. In fact, he resisted all attempts of the Arya jats to be called Aryas only.[26]

Chhotu Ram, too, acknowledged the essentially political motives behind the shuddhi enterprise when he stated that:

The very aim of the (shuddhi) movement was to integrate the Shuddh-Shuddh jats into the fold of the jat community so as to strengthen the jats.[27]

It should also be noted that, as in the case of the malkana rajputs, the supposedly anti-caste Arya Samaj not only sought to convert the mula jats as an entire caste group (which it would not have attempted had it really been opposed to the caste system), but also tried, though in vain, to get the mula jats absorbed into the Hindu jat caste. Had the shuddhi of the mula jats been successful this would undoubtedly have further strengthened the caste system, a social order which the Aryas denounced in theory.

Besides the conversion to Hinduism of nominally Muslim castes such as the malkanas and the mula jats, the Arya Samaj also reached out to castes on the peripheries of the Hindu caste order who, though non-Muslim, practised many Islamic customs. Historically, it was the gradual adoption of many Muslim practices by non-Muslim caste groups that paved the way for their eventual formal conversion to Islam. The Arya Samaj sought to prevent this by campaigning against these customs and practices. This de-islamisation among the peripheral castes was soon followed by their eventual conversion to Hinduism after undergoing the Arya shuddhi ceremony.

One instance of this is the Arya Samaj's missionary efforts among the Bishnois, a large farming community spread over Rajputana and the western districts of the United Provinces. The Bishnois had adopted several Muslim customs such as burial of the dead, employing the name 'Allah' to refer to God and using Muslim names and, unlike orthodox Hindus, they did not worship idols. A leading Arya missionary, Shraddhananda Sanyasi, explains this by saying that:

> ...having once slain a Qadi, who had interfered with their rite of widow-burning, they had compounded the offence by embracing Islam.[28]

The Arya Samaj began working among the Bishnois in the 1920s. Gradually they were made to give up their Islamic customs and today they are almost a full-fledged Hindu caste.

Another similar case of the Arya Samaj's efforts to do away with Islamic customs practised by peripheral non-Muslim castes was that of its work among the bhangis (sweepers) of Rajputana and the Punjab. From the point of view of the brahminical *Dharmasastras* (law-books), the bhangis, along with all other 'untouchable' groups, are considered to be non-Hindus or outcastes, since they fall outside the 'chaturvarnya', the four-fold Hindu caste order. Hence, the bhangis were largely uninfluenced by the brahminical ethos. They, in fact, had adopted many Islamic customs and several of them had converted to Islam in search of social equality and dignity.

This free borrowing of Muslim customs by the bhangis was noted by William Crooke who, writing in 1896, observed that,

> The religion of the sweepers is a curious mixture of various faiths. Some ... profess to be Hindus, others Musalmans, others Sikhs...[29]

The bhangis of the princely state of Jodhpur in western Rajputana celebrated Muslim festivals such as Shab-e-Barrat, Moharrum and the 'urs of local 'pirs'. Most of them were followers of the cults of Sufi saints such as Zinda Pir, Lal Beg, Sujani Pir and Ghazi Pir. Many non-Muslim bhangis of Jodhpur kept Muslim names.[30]

The Arya Samaj began its programme of de-Islamising the Jodhpur bhangis in 1923. Its main objective was said to have been "to eradicate Muslim influence from their socio-religious spheres and to create a feeling of Hinduism".[31] The conversion of the bhangis to the Arya Samaj fold did not in any way help in ameliorating their dismal social and economic conditions. Nor did the giving up of Muslim customs at all help in elevating them from the lowest rung of the caste system.

In the wake of the partition of the subcontinent in August 1947, bloody riots broke out all over northern India in which thousands lost their lives. In several areas, Hindus forced Muslims to choose between fleeing to Pakistan, being slaughtered or else agreeing to convert to Hinduism. Under duress scores of Muslims are said to have chosen the third option.[32]

By 1950, when India declared itself a republic, the communal situation had shown some signs of improvement. Fairly strong modernist and liberal political tendencies had emerged, and Hindu political outfits such as the Hindu Mahasabha and the RSS had been considerably marginalised. This, however, was not to last very long and by the early 1970s, coinciding with the emergence of the general crisis of the Indian state, extreme right wing brahminical Hindu militancy saw an enormous upsurge. The main force behind this was the RSS, which operates through a large number of frontal organisations working in different fields. One of the most powerful of these is the VHP, the "World Hindu Congress", floated in 1964, among whose main objectives is the conversion of all the non-Hindus to Hinduism.

Recent Conversions

The most recent of the mass conversion of Muslims to Hinduism organised by the VHP has been that among the Cheeta-Merat rajput Muslims. This community numbers over 3,00,000 and is scattered across the districts of Udaipur, Pali, Bhilwara and Ajmer in Rajasthan, with their biggest concentration being in the Beawar region of Ajmer district. These Muslims are believed to be descended from the rajput king Prithvi Raj Chauhan, who fought several battles with the Muslim rulers of Delhi. According to local tradition, Cheeta, grandson of Mera Chauhan, converted to Islam during the reign of the Mughal emperor Aurangzeb (1658-1707 AD) and his descendants came to be known as cheetas, mers or merats. On the other hand, the other descendants of Mera Chauhan remained Hindus and are known as gorat merats, barar mers or rawats.[33]

In the early censuses, however, all the mers were classified as belonging to non-Hindu aboriginal tribes and even today the distinction between Muslim and Hindu mers remains blurred. Indeed, apart from the practice of circumcision and the burying of the dead, the nominally Muslim mers are quite indistinguishable from their Hindu relatives. Until recently, mers, irrespective of religion, used to freely inter-marry and brahmins would perform their marriage ceremonies according to Hindu rites.

Commenting on the admixture of Hindu and Muslim customs among the mer or cheeta rajputs, Lodrick notes that:

> Mers (Muslims) and Rawats (Hindus) shared a common culture, inter-dined, wore similar dress and even worshipped the same Hindu deities. Hindu mers disregard many of the traditional Hindu prescriptions concerning ablutions, ceremonial forms and food, and have no compunction about eating beef or any animal flesh. Many orthodox Hindus disassociate themselves from the mer community, and a strong case can be made for regarding mers, whether Katat mers, Gorat merat or Rawat, as a distinct group that fits neither the Mouslem nor the Hindu mould.[34]

The close kinship and other social ties between the Hindu and Muslim mers, however, came in for vigorous opposition from the Arya Samaj. Its founder, Dayananda Saraswati, had set up his headquarters at Ajmer, and he is said to have made the Hindu mers of the neighbouring Masauda and Merwara regions give up the practice of intermarrying with the Muslim mers.[35]

The gradual drifting apart of the Muslim mers and the Rawats was further accelerated by the introduction of the franchise and communal representation in British India as well as by the bloody events immediately before and after the independence of India in 1947.[36]

According to Jamal Khan, president of the Cheeta-Merat-Kathat Sabha of Beawar, the first conversions of Muslim mer rajputs to Hinduism occurred in 10 to 15 villages in the Bhim tehsil of the Udaipur district in 1947. Thereafter, strenuous efforts were made to Hinduise the mers of Beawar. One means that was adopted was the instruction given to Hindu school teachers by some local rajput heads of villages to change the names of their Muslim students to Hindu ones in the official school records.[37]

In the 1970s, the organised attempts by the VHP to convert the mer Muslims were further intensified. It has been alleged that since

1975, the VHP's conversion drive in this region has been funded by a monthly grant of Rs 3,00,000 by Birla and Company, India's largest industrial house.[38] In the same year, the Chauhan Rajput Sabha, a Hindu rajput outfit allied to the VHP, held a meeting on January 19 at Kana Kheda in the Ajmer district which was attended by Hindu Chauhan rajput heads of several villages. In its resolution it appealed to the Muslim Chauhan mers to abide by the following decisions of the sabha:

(1) Circumcision should be done away with.
(2) Keeping in mind the glory of our caste, the marriages of our children should be performed in Hindu style by circumbulation of fire.
(3) On the death of any Chauhan, no *fakir* (Muslim mendicant) should be called and nor should the *fatiha* be recited.
(4) Since we are the descendants of Prithvi Raj Chauhan, to maintain the glory of our caste we should give our children only Hindu titles and surnames such as Singh, Raj, Chand, Kumar, Lal, Ram, etc.[39]

As is evident from this resolution, the de-Islamisation of the Muslim mers, and their acceptance of certain Hindu customs and cultural norms, rather than a concern for their spiritual and social development, forms the core of the conversion drive among them.

The VHP is reported to have made several films on Prithvi Raj Chauhan and Baba Ramdeo Ji, another Chauhan hero whom Muslim rajputs also revere, which are regularly screened in mer Muslim villages. Through these films the VHP is seeking to propagate a distorted history of the ancestors of the mers as having been forcibly converted to Islam by the Muslim rulers.[40]

Taking advantage of the abject poverty of the mers, the VHP is said to be attempting to win them over by the liberal distribution of rice and clothes. It has set up free dispensaries in the Muslim mer-inhabited hamlets of Shyamgarh, Chana and Kharkhedi in Ajmer district as well as schools, hospitals and creches in other mer villages of the Beawar region.[41]

The process of persuading the Muslim mers to convert to Hinduism is said to take several months and it involves organising kirtans (ceremonies at which hymns are sung and sermons are delivered) and meetings in which the VHP's version of the history of the mers is narrated.[42] Before the actual conversion itself, villagers are made to sign a joint letter addressed to the VHP which invariably states that they want to give up their Muslim customs at a ceremony in which they shall take a solemn oath to adhere to the 'pure kshatriya dharma', the rules of social conduct appropriate to members of the Hindu rajput warrior caste. The letter is said to always end with a request to the VHP to make arrangements to screen films on Prithvi Raj Chauhan. A letter of this sort is the VHP's way of ensuring that the conversion ceremony is seen as purely voluntary.[43]

The VHP claims to have converted over 47,000 mers, though this number is said to be a gross exaggeration. In the wake of these conversions some Islamic organisations such as the Jamiyat-ul-Ulema-i-Hind, the Rajasthan DiniTalimi Sangh and the Muslim United Forum of Pali are said to have stepped up efforts to bring the mers back to Islam.

The conversions among the mers, quite expectedly, caused great concern to Muslim leaders and a leading Indian Muslim politician, Syed Shahabuddin wrote to the government seeking its opinion in the matter. In response, the home ministry, in its letter December 29, 1983 to Shahabuddin, opined that the Cheeta-Merats who had come under the influence of the VHP had only thereby "re-affirmed their faith in Hinduism".[44] The choice of the phrase "re-affirmation of faith" instead of "conversion" was too significant to be ignored.

The VHP claims to have converted over 20,000 Muslims in the remote Kutch district of northern Gujarat, though this is certainly a gross exaggeration. It is now said to be eyeing the 5,00,000 strong Maul-e-Salaam girasiya rajput Muslims of central Gujarat, who still retain many Hindu customs.[45] Muslims in many parts of India live in constant fear of attacks by Hindu mobs in which, especially in recent years, the police is known to play an extremely partisan role, often actively assisting the Hindu rioters. Heightened insecurity has driven some Muslims to enter Hinduism to protect their lives and property. Hasmukh Patel, a leading VHP functionary from Gujarat, explains his outfits success in winning Muslim converts by stating that:

> We promise the both *swabhiman* (self-respect) and *salamati* (security) if they convert.[46]

Seen in the context of the repeated bloody anti-Muslim progroms that periodically rock Gujarat, this promise to grant Muslim converts security seems but a veiled threat of violence being unleashed against Muslims if they fail to convert.

The VHP is said to have converted some 200 Muslims of the mir caste of musicians in Ahmedabad, Gujarat in early 1993. It is also said to be attempting to convert half a dozen Muslim castes in central Gujarat who still have not discarded many of the Hindu customs of their ancestors.[47] Conversions of Muslims to Hinduism are also said to have occurred in some states ruled by the Bharatiya Janata Party (BJP), the right wing Hindu party. Thus, in 1992 the rajput Muslim inhabitants of eight villages in the Hathras district of Uttar Pradesh were converted by Arya Samaj and the VHP. According to a report in a leading English language daily:

> ...over the past many years, volunteers of the RSS have been systematically raiding the community (i e, the Muslims of these villages), using their abject poverty to lure them with promises of employment and a higher standard of living... Not surprisingly, the exertions of the RSS band bore fruit and four years ago, a sizeable number of Muslims, as many as 12 each from the villages of Allahpur and Sujjan alone, took to Hinduism.

The report goes on to add that the ruling BJP, too, had a hand in these conversions, and that:

> ...it (the BJP) has begun to take direct interest in the operation. On October 18, a party delegation led by two MPs from Hathras, Dr L B Rawal and Mr Suresh Anand, participated in a *shastra pujan* ('worshipping of weapons') ceremony at Sujjan. The ceremony was organised by the *Saraswati Shishu Mandir*, a school run by the RSS-sponsored Vidya Bharati mission. At the ceremony, the MPs, according to eyewitness accounts, gave impassioned speeches extolling the virtues of the *kshatriya* (rajputs) and stressed that the adoption of the *kshatriya dharma* was the only path to salvation.

Since Sujjan is an overwhelmingly Muslim village, the purpose of the visit by the BJP's MPs, according to the report, "could only have been to secure more conversions".[48]

The dramatic rise in recent years of the BJP in Indian politics has ominous portents for the future of the Indian Muslims. It is likely that if this party were to come to power at the centre, efforts to convert the Muslims to Hinduism would receive a tremendous impetus. After all, the late M S Golwalkar, the head of the RSS of which the BJP is the political wing, had declared that the Indian Muslims must,

> ... either adopt the Hindu culture and language, must learn to respect and hold in reverence Hindu religion, must entertain no idea but those of the glorification of the Hindu race and culture, i e, of the Hindu nation, and must lose their separate existence to merge in the Hindu race, or may stay in the country, wholly subordinated to the Hindu Nation, claiming nothing, deserving no privileges, far less any preferential treatment—not even citizen's rights.[49]

CONCLUSION

The Hindu missionary enterprise seems more of a politically-inspired movement rather than a purely religious undertaking. In all the cases of the mass conversions of Muslims to Hinduism the central trust has been on their de-Islamisation rather than on their accepting, in any real sense, the Hindu religion. This is not merely due to the absence of a set of fundamental tenets in Hinduism, but primarily because the Arya Samaj and the Vishwa Hindu Parishad missionaries seem more concerned with weaning Muslims away from Islam than with the spiritual instruction and development of their converts.

Muslim castes which have been particularly vulnerable to Hindu missionary efforts have several features in common. They are generally only nominally Muslim and still retain many Hindu customs and beliefs. Most of the mass conversions have occurred among Muslim rajput groups. The malkanas, cheeta merats, Maul-e-Salaam girasiyas and the meos are all of rajput origin, and the mula jats, too, claim kshatriya ancestry. In converting to Hinduism many rajput Muslims were perhaps attracted by the promises given to them of their being restored the 'upper' caste privileges due to them as descendants of members of the rajput kshatriya community.

The Hindu missionaries, too, seem to have exhibited an inordinate interest in converting the socially dominant and powerful Muslim rajputs, since the entire shuddhi movement was largely undertaken to bolster the fortunes of the entrenched Hindu 'higher' castes. On the other hand, there have been few instances of mass conversions to Hinduism among the 'lower' Muslim castes, who form the majority of the Indian Muslim population. This is perhaps due to the fact that the Hindu missionary outfits, being upholders of the brahminical caste order, have not shown great concern for the spiritual salvation and the social upliftment of the lower castes. Further, since the Hindu missionary organisations promise to rehabilitate Muslim converts into the caste to which their Hindu ancestors originally belonged, few 'low' caste Muslims would be willing to enter the Hindu fold since that would mean being once again accommodated at the lower rungs of the caste system as untouchables and shudras.[50]

It is also worth noting that these mass conversions have mostly occurred in the backward regions of northern India where feudalism is still largely intact and where brahminism has not been challenged by assertive 'lower' castes as elsewhere. In regions such as southern India, where Muslims are fairly well-educated and where 'upper' caste Hindu communalism has been, to a great extent, countered by low caste anti-brahminical militancy, few conversions to Hinduism among Muslims have been reported. There have, in fact, been no instances of any major mass conversions of Muslims outside the orthodox brahminical heartland of northern India.

50 As for those Muslim converts to Hinduism who were not aware of the caste of their Hindu ancestors, the Hindu Mahasabha, the leading orthodox Hindu political organisation, proposed that a new Varna or broad caste category, in addition to the existing four varnas be created to accommodate them. Thus N C Chatterjee, delivering the presidential address at the Hindu Mahasabha's 30th general session at Bhopal on December 28, 1952 asserted that, "We should not neglect *Shuddhi* and *Sangathan* (Hindu unity) and we should declare all converts to Hinduism who cannot be fitted into their old families as belonging to the *Mahasava Varna*" (see N C Chatterjee, *Presidential Address*, All India Hindu Mahasabha, New Delhi, 1952, p 19).

SCHEDULE 17

NOTES ANNEXED TO AND FORMING PART OF THE ACCOUNTS OF THE INDIAN BRANCHES FOR THE YEAR ENDED MARCH 31, 1994

A STATEMENT OF ACCOUNTING POLICIES

i BASIS OF PRESENTATION

The financial statements have been prepared on the historical cost basis in accordance with generally accepted accounting principles and conform to the statutory requirements prescribed under the Banking Regulation Act 1949.

ii FOREIGN CURRENCY TRANSLATION

Assets and liabilities in foreign currencies are translated at year end rates of exchange. Revenues and expenses have been translated at rates prevailing on the transaction date. Foreign exchange trading positions including spot and forward contracts are valued monthly at prevailing market rates and the resulting gains and losses are included in foreign exchange revenue.

iii CREDIT LOSSES

The Bank has a consistent internal policy of classifying its commercial and consumer loans and advances and full provision for credit losses and writeoffs, have been made to satisfy the Prudential accounting norms prescribed by the Reserve Bank of India for asset classification and for income recognition.

iv SECURITIES

The Bank has been consistently classifying its securities portfolio into current (trading) and permanent (investment). Trading securities are marked to market, and in cases where no quotations are available, is derived by reference to the applicable market yield. Investment securities are generally stated at cost.

v PREMISES AND EQUIPMENT

Premises and equipment are stated at cost/valuation less accumulated depreciation. Depreciation is computed on written down value method (other than certain assets in staff quarters for which depreciation is computed on straight line method) with reference to the estimated useful life of the asset. Certain premises belonging to the Bank in India have been revalued by an approved valuer as at March 31, 1994 and the increment in value amounting to Rs. 686,573,919 has been brought into the books of account and credited to Properties revaluation reserve.

vi STAFF BENEFITS

The Bank has fully funded contributions to the Pension Fund and Superannuation benefits for its employees with the Life Insurance Corporation of India.

vii INCOME RECOGNITION

The Bank follows a procedure of income recognition which satisfy the norms prescribed by the Reserve Bank of India.

AUDITORS' REPORT ON THE ACCOUNTS OF THE INDIAN BRANCHES OF CITIBANK, N.A. UNDER SECTION 30 OF THE BANKING REGULATION ACT, 1949

We have audited the attached Balance Sheet of the Indian Branches of Citibank, N.A. (incorporated with Limited Liability in the U.S.A.) as at 31 March, 1994 and the relative Profit and Loss Account of the Indian Branches of the Bank for the year ended on that date signed by us under reference to this report.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and Profit and Loss Account together with the notes thereon, are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956. The accounts are, therefore, drawn up in conformity with Forms "A" and "B" of the Third Schedule to the Banking Regulation Act, 1949.

1. We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory.

2. The transactions which have come to our notice have been, in our opinion, within the powers of the Indian Branches of the Bank.

3. In our opinion, proper books of account as required by law have been kept by the Indian Branches of the Bank so far as appears from our examination of these books.

4. The above mentioned Balance Sheet and Profit and Loss Account of the Indian Branches of the Bank dealt with by this report are in agreement with the books of account.

5. In our opinion and to the best of our information and according to the explanations given to us, the Balance Sheet and Profit and Loss Account together with and subject to the notes thereon give the information required by the Companies Act, 1956, as amended in the manner so required for Banking Companies and on such basis the said Balance Sheet gives a true and fair view of the state of affairs of the Indian Branches of the Bank as at 31 March, 1994 and the Profit and Loss Account gives a true and fair view of the Profit of the Indian Branches of the Bank for the year ended on 31 March, 1994.

India's External Debt

Retrospect and Prospects

Nirupam Bajpai

Statistics bear testimony to the fact that India's external debt has grown rapidly over the 80s. Also, it has been contracted on increasingly hard terms. With the serious external payment crisis that the country went through in the recent past, concern about the size and composition of India's external debt has come into sharp focus.

An attempt is made in this article to examine the reasons for the surge in the debt and its servicing burden. A modelling exercise is undertaken to project India's external debt and balance of payments.

I
Introduction

IT has been more than a decade since the debt moratorium announcement of Mexico. Ever since then the developing country debt crisis is dragging on. In much of Latin America, most of low income Africa and in several other debt distressed countries, the prospects for economic development in the 1990s remain severely constrained by an unfortunate conjuncture of influences, among which the burden of external debt is very prominent. The crisis is no longer perceived as a matter of temporary illiquidity of borrowers or as a threat to the overall international financial system. Above all, it is now seen in terms of impediments to debtors' prospects for economic growth and development. Therefore the key issues now relate to the impact of external debt upon levels and productivity of investment and of capacity utilisation in developing countries. Perhaps, too much of the adjustment thus far has been borne by investment cuts in the debtor countries. Also there is now an appreciation that the required internal transfer from the private to the public sector is no less a part of the debt crisis than the external transfer problem.

Over the years a broad consensus has emerged that there is a theoretical possibility that a debt overhang can damage the prospects of both creditors and debtors by way of discouraging private investment and economic policy reform, that is, that there exists a debt Laffer curve. Above some finite value of debt, further borrowing reduces the present value of future repayment obligations. Also there is wide ranging agreement that many debtor countries are now on the wrong side of the Laffer curve. While there have been a number of debt relief and restructuring strategies adopted over the 1980s the debt ridden countries have yet to grow out of the crisis. More importantly, experts with diverse views now tend to agree that domestic policy reform, foreign direct investment, and returning flight capital, together with modest and voluntary debt reduction have not succeeded in restoring growth and creditworthiness in the debt distressed countries.

The majority of the studies relating to the international debt crisis focus their attention on the debt owed to commercial banks by middle income countries, particularly those in Latin America. By contrast, the debt crisis in the low income countries has received little serious attention, perhaps because their debt liabilities are mainly loans from or are guaranteed by official creditors and consequently the commercial bank exposure is far less than that of the middle income countries.

For analytical purposes, the World Bank has classified low income countries (LICs)[1] and middle-income countries (MICs)[2] into two groups. These are called the severely indebted and the moderately indebted group of countries. The severely indebted low income countries (SILICs) and the severely indebted middle-income countries (SIMICs) are defined as countries in which either one of two key ratios for 1989-91 is above the critical level. These ratios and their critical levels are: present value of debt service to GNP (80 per cent), present value of debt service to exports of goods and all services (200 per cent).

Similarly the moderately indebted low income countries (MILICs) and the moderately indebted middle-income countries (MIMICs), are defined as countries in which either one of the two key ratios for 1989 91 falls in the following ranges: present value of debt service to GNP (48 80 per cent), present value of debt service to export of goods and all services (132 220 per cent). With the exception of China almost all other developing countries are classified in one or the other of the above mentioned categories. Although both India and China are low-income countries, the former is classified as a MILIC, while the latter is not a part of any of the analytical groups.[3]

India's external debt has grown rapidly over the 1980s. Also, apart from the growth in its size, it has also been contracted on increasingly hard terms. A decade ago, for example, 89 per cent of India's external debt was owed to official bilateral and multilateral creditors and was on highly concessional terms, that is, interest rates averaged 2 2 per cent and maturities averaged 35 years. However, during the period 1985 91, private creditor exposure to India has more than doubled i e, from $ 8 9 billion in 1985 to almost $ 22 5 billion by March 1991.[4] Increasing dependence on commercial borrowings has resulted in making the profile of India's external debt biased in favour of commercial debt.

Various estimates of India's external debt strongly suggest the need to take a closer look at its size and composition. Also, there is need to study the reasons for the surge in the debt and debt service burden and the policy options that India has in the backdrop of the current situation in order to keep the debt and debt service burden within manageable limits. With the serious external payment crisis that the country went through in the recent past, concern about the size and composition of India's external debt has come into sharp focus.

II
India's Mounting External Debt

India is one of the largest debtors among the developing countries, if ranked by outstanding external debt stocks. However, its ranking is much lower by debt service since a large proportion of its debt is still on concessional terms. At the end of fiscal year 1991-92, India's outstanding external debt amounted to US$ 71 5 billion, including obligations to the IMF, short-term debt, and approximately $ 9 2 billion of foreign currency deposits owed to non-resident Indian citizens.[5]

The World Debt Tables, 1992 93 shows that the total external debt of India (long-term public and publicly guaranteed, short-term debt and the use of IMF credit) rose from $ 36,677 3 million in March 1986 to $ 71 557 million in March 1992 (Table 1). *The Economic Survey*, 1992-93, on the other hand, shows that the aggregate external debt of India, excluding defence debt and the

civilian rouble debt, rose from $ 37,350 million in March 1986 to $ 67,580 million in March 1992.[6] However, as of September 1992, the *Economic Survey* reports India's total external debt to be of the order of $ 71,110 million which is close to what the World Bank data is for March 1992. Although, now the government of India provides external debt data as per the recommendations of a 'Policy Group and Task Force on External Debt Statistics of India',[7] there still exist differences in the statistics compiled by the government and those of international agencies such as the World Bank.

Between the period April 1986 and March 1992, India's aggregate external debt recorded a phenomenal increase of 95 per cent. The debt to official creditors rose from $ 23,608 million to $ 40,344 million during the same period, registering thereby an increase of 71 per cent. Debt obligations to the private creditors, on the other hand, witnessed an increase of over five times over the same period. Of course, a large chunk of it is in the form of NRI deposits which were not considered as part of external debt prior to 1987. Similarly, another significant factor with regard to India's external debt has been a sharp increase in the borrowing requirements of short-term debt (Table 1).[8]

Data obtained from the department of economic analysis and policy (DEAP), Reserve Bank of India, show that the NRI deposits (outstanding) rose from being US $ 1,044 million ($ 188 mn in FCNRA and $ 856 mn in NR(E)RA) in 1980 to $ 6,073 million ($ 2,719 mn in FCNRA and $ 3,354 mn in NR(E)RA) in 1987. The tentative figures for the same in 1993 stood at $ 8,160 million, of which, $ 5,287 million was in FCNRA and $ 2,873 million in NR(E)RA. However, in 1992 the outstanding NRI deposits fell sharply. As against $ 10,584 million in 1991, these deposits stood at $ 7,847 million in 1992 (Table 3). This significant decline was mainly due to the serious payments crisis that India went through in July 1991, and the consequent down grading of India's credit rating abroad. In the fiscal year 1991-92, $ 1,611 million were withdrawn from the FCNRA and $ 27 million from NR(E)RA by the non-resident Indians (Table 4).

Earlier the NRI deposits were not treated as part of the country's external debt. However, some international agencies were considering them to be a part of external debt and now the government of India too

Source: Computed from Table 1.

recognises them as a component of India's debt. However, only NRI deposits with original maturity of more than one year are being treated as long-term. Deposits up to one year maturity are proposed to be classified as short-term debt. The RBI data on NRI deposits does not include the accrued interest, whereas the World Bank data does, and therefore the figures provided by the latter are higher. The reason government of India did not consider NRI deposits as part of India's debt earlier was due to the fact that most of the deposits were renewed from time to time and it was presumed that they would eventually be utilised in India. However, this assumption did not hold good in 1991-92 when large-scale outflows took place (Table 4) and it was decided to include the deposits of non-resident Indians in external debt from the point of view of debt management.

The short-term debt of India includes all borrowings above six months and up to one year maturity. The short-term debt is classified into two broad heads, namely, banker's acceptance facility (BAF) and supplier's credit. While the former includes short-term bank exposures along with the roll-overs of BAF, the latter includes export credit arrangements for the period of six months to one year. The disaggregate data with regard to the short-term debt is given in Table 5.

The debt service burden of the government of India has been steadily rising and particularly so after April 1986. According to the *World Debt Tables*, total debt service (long- and short-term) increased from \$ 1,343 million in 1980-81 to \$ 2,829 million in 1985-86 and further to \$ 7,445 million in 1991-92. As against these figures, the *Economic Survey* reports the total debt service to be \$ 1,410 million; \$ 2,610 million; and \$ 6,440 million respectively for the above mentioned years. The World Bank data on total debt service includes interest on short-term debt and the IMF repurchases and charges. The interest payments on short-term debt increased from \$ 226 million in 1985-86 to \$ 400 million in 1991-92. For data on short-term debt refer to Tables 1 and 5. IMF repurchases and charges, on the other hand, rose to as high as \$ 1,444 million in 1988-89 but have since seen a decline and were \$ 663 million in 1991-92. The repayment of IMF credit, the growing proportion of commercial credits in the total credit and also the growing proportion of non-concessional and non-grant elements in the official credit have raised the debt service payments substantially between the period 1986-87 and 1991-92 as compared to the level obtaining in 1985-86.

The growing commercial borrowings have substantially changed the profile of India's external debt. The share of official credit in the total external debt declined precipitously from around 88 per cent in 1980-81 to 64 per cent in 1985-86 and further to 56 per cent in 1991-92 (Tables 2 and 10). While the share of multilateral credit remained stable around 34 to 35 per cent of the total outstanding debt of India, it was the bilateral credit (loans from governments and their agencies and loans from autonomous bodies funded by the government) that registered a steep decline. The share of bilateral credit in the total external debt of India declined from being 53 per cent in 1980-81 to 30 per cent in 1985-86 and further to 23 per cent in 1991-92 (Table 2). In absolute terms, the bilateral credit flows were \$ 10,353 million in 1980-81, \$ 10,861 million in 1985-86 and \$ 16,352 million in 1991-92 (Table 1).

The share of credits from the financial markets in the total long-term credit to India increased from a negligible level of 0.7 per cent in 1977-78 to 2.9 per cent in 1980-81 and to 13.3 per cent in 1985-86. For the subsequent period, however, as the *World Debt Tables* have clubbed the financial market borrowings in a separate category entitled 'Other Private' it is not known how much credit has been raised from the financial markets. Similarly, debt obligations from the commercial banks have risen sharply. Debt to the commercial banks increased from being \$ 464 million in 1980-81 to \$ 2,196 million in 1985-86 and finally to \$ 7,067 million in 1991-92.[9] Furthermore, India's short-term debt obligations have also been increasing at a fast pace. Such obligations stood at \$ 926 million in 1980-81 (4.8 per cent of total debt stocks), \$ 1,516 million in 1985-86 (4.1 per cent of total debt stocks), \$ 4,800 million in 1990-91 (6.9 per cent of total debt stocks). However, the short-term debt declined in 1991-92 and was placed at \$ 3,791 million (5.2 per cent of total debt stocks). The change in the debt profile is thus attributable mainly to the rising financial market borrowings and a steep decline in the bilateral credits. Also, the component of concessional debt in the total debt has fallen steadily. From being as high as 75 per cent in 1980-81 it fell to 49 per cent in 1985-86 and further to 42 per cent in 1991-92.

India's borrowing terms witnessed distinct signs of hardening over the 80s. Consequently, India's debt service burden increased year after year. The maturity period of new official credit commitments to India shortened from 36 years in 1980-81 to 30.7 years in 1985-86 and further to 25.9 years in 1990-91 (Table 6). Also, the maturity period of new private credit commitments fell over the 80s, from being 9.5 years in 1980-81 to 9.8 years in 1985-86 and to 7.7 years in 1991-92. Interest cost on new official credit commitments after remaining stable around 2.2 per cent until 1980-81 jumped to 6.2 per cent in 1982-83 and since then has fluctuated between 4 and 6 per cent. By contrast, the interest rate on private credit declined continuously from a high level of 15.5 per cent in 1980-81 to 8.3 per cent in 1985-86 and was marginally higher at

8.7 per cent in 1991-92 (Table 6). There has also been a significant reduction in the grant element in the new credit commitments to India. The grant element on all credits together declined from 71.7 per cent in 1977-78 to 46.2 per cent in 1980-81 and further to 30.3 per cent in 1985-86. However, in 1991-92, the grant element was placed at 31.3 per cent.

As a result of the substantial reduction of the maturity period, the volume of principal repayments in respect of long-term debt increased from $ 778 million in 1980-81 (4 per cent of total debt) to $ 1,570 million in 1985-86 (4.3 per cent of total debt) and further to $ 4,140 million in 1991-92 (5.7 per cent of total debt). There was also significant increase in interest payments which rose from $ 566 million in 1980-81 (2.9 per cent of total debt) to $ 1,259 million in 1985-86 (3.4 per cent of total debt) and further to $ 3,305 million in 1991-92 (4.7 per cent of total debt). For details refer to Tables 1 and 2.

Interest and amortisation payments which together absorbed 41 per cent of the total disbursements in 1980-81 rose sharply to 61 per cent in 1985-86 and further to a substantially higher level of 84 per cent in 1991-92 leaving a net transfer to India of only 16 per cent of the total annual long-term credit disbursements (Table 7). Net transfer from multilateral creditors and private creditors have declined significantly. As regards the former, net transfers fell from 88 per cent of total annual disbursement in 1980-81 ($ 1,351 million) to 66 per cent in 1985-86 ($ 922 million) and further to 46 per cent in 1991-92 ($ 1,267 million). Net transfers from private creditors fell from 66 per cent of total annual disbursement in 1980-81 ($ 248 million) to 51 per cent in 1985-86 ($ 598 million) and finally to minus 22 per cent in 1991-92 ($ -589 million), i e, substantial flow of resources from India to the creditor institutions. For details refer to Table 7.

Amongst the principal debt indicators listed in Table 8, at least three require to be analysed in detail. These are: the debt service ratio (TDS/XGS); the debt/GNP ratio (EDT/GNP); and perhaps the most important for a realistic picture of the debt servicing capacity, the current account deficit/exports ratio (CAD/XGS). While the debt service ratio is one of the most widely used debt indicator for a country, its inadequacy becomes apparent when we recognise that an increase in exports can be accompanied by a proportionate or more than proportionate increase in imports, thereby worsening the country's debt servicing capacity despite an increase in exports. Be that as it may, the debt service ratio for India increased from 10.9 per cent in 1980-81 to 21.5 per cent in 1985-86 and to 30.6 per cent in 1991-92. The debt/GNP ratio rose from 11.9 per cent in 1980-81 to 18.5 per cent in 1985-86 and to 29.2 per cent in 1991-92 (Table 8).

Changes in the current account deficit/exports ratio over time will directly indicate the changes in the gap (current account deficit) the country has already bridged (or otherwise) and the gap it still has to bridge before generating a capacity for servicing its external debt obligations. Ultimately, the ability of a country to service its external debt depends on the surplus of its export earnings over import payments. A fall in the CAD/XGS ratio will reflect a narrowing of the gap to take the country nearer to a stage of generating a debt servicing capacity. A rise in the ratio, on the other hand, will indicate that the distance the country has to traverse has increased and therefore it has become more difficult for it to generate a debt servicing capacity. Furthermore, a rise in the CAD/XGS ratio will also point to the movement of the country towards greater dependence on external resources, and thereby larger debt servicing obligations in the future.

The current account deficit/export ratio for India between 1985 and 1990 is seen to be very high. In fact, for the years 1985 and 1988 it is as high as 55 and 57 per cent respectively (Table 8). While the cumulative current account deficit for the decade of the 70s was a mere $ 4.7 billion, the same for the 80s was as high as $ 58 billion. As a proportion of 1981 GDP, the cumulative current account deficit for the period 1970-80 was 2.7 per cent. Whereas, as a proportion of 1991 GDP, the cumulative current account deficit for the period 1981-90 was as large as 19.5 per cent (Table 9). The CAD/XGS ratio, however, declined substantially in 1991 to 17.73 per cent. Of course, this sudden decline in 1991-92 is mainly attributable to the wide-ranging import curbs necessitated by the serious payments crisis that faced the country in mid-1991. While the current account deficit in 1990-91 was $ 7,727 million, the same for 1991-92 stood at a substantially lower level of $ 3,169 million.

The large and persistent current account deficits over the 80s have had and will continue to have far-reaching implications on the capital account of the balance-of-payments. While, on the one hand, larger borrowings were undertaken to finance these deficits, on the other, they were largely on commercial terms since both concessional multilateral and bilateral credits were not forthcoming as they were in the 70s and the early 80s. Debt owed to the commercial banks alone rose from $ 2.1 billion in 1985 to $ 7 billion in 1991. By contrast, debt owed to the commercial banks in 1980 was a mere $ 464 million. Also, the short-term debt rose from $ 3.1 billion in 1985 to $ 4.8 billion in 1990. However, it declined to $ 3.7 billion in 1991.

While principal repayments have had some degree of year-to year fluctuations during the second half of the 80s, the interest payments have risen far more sharply. The latter rose from $ 1.9 billion in 1985 to $ 3.9 billion in 1990, although they declined to $ 3.3 billion in 1991. The principal repayments have averaged around $ 3 billion a year during these seven years. More importantly, the implications of large-scale commercial borrowings on the capital account will be reflected during the mid- and late 90s when the repayment of such loans is supposed to commence. The average maturity period for the commercial loans raised during the second half of the 80s is 10 to 11 years (Table 6).

III
External Debt and BoP Projections for India

The external sector has been assuming an increasing degree of importance and relevance to developing countries, particularly in the case of countries with low growth rates of savings and GDP and lagging in technological development. The periodical assessment of a country's external debt and investment position has, therefore, evoked considerable public interest due to its policy implications. With the

growing need to raise resources in foreign currencies to meet the cost of imports, capital requirements of developing countries have grown substantially. This has led in many developing countries including India to relax their economic regulations paving way for smoother flow of capital from abroad. Also, many incentives and fiscal concessions have been offered to attract foreign investment.

Over the 80s, developing country debt witnessed considerable rise in its volume and consequently servicing commitments. The issue concerning reduction and restructuring of the debt burden have been discussed at different fora. Several plans have been formulated by international agencies to help the indebted countries in this regard. The increasing debt servicing burden has seriously eroded the balance-of-payments position in most of the highly indebted countries which, in turn, has adversely affected their growth performance.

While the problem of India's mounting external debt and servicing burden has been discussed at length in Section II, the present section analyses the projections of India's external debt and balance-of-payments. The debt projections have been done using the World Bank's Revised Minimum Standard Model (RMSM-X) for India. The RMSM is a disaggregated trade gap model, which consists of a simple system of relationships based on general economic principles. It is essentially an accounting framework of the national accounts and the balance-of-payments with special attention to flows resulting from external borrowings.

The projections of India's external debt and the balance-of-payments have been done for the period 1992-93 to 2001-02. While the data source for the former is *World Debt Tables 1993-94*, for the latter, the data is from the Reserve Bank of India, Annual Reports (various issues). The projections have been done for two scenarios, that is, the optimistic and the pessimistic scenario. The debt projections have been divided into seven broad heads. These are: commitments, disbursements, principal repayments, interest payments, net flows, net transfers, and debt service. While assumptions have been used for projecting commitments, disbursements, principal repayments, and interest payments, the remaining three heads, i e, net flows, net transfers, and debt service are calculated by the model using the projections.

The seven broad heads mentioned above have been further disaggregated into 10 sub-heads each. These sub-heads are: IDA, other concessional multilateral, IBRD, other non-concessional multilateral, bilateral concessional, bilateral non-concessional, bonds, commercial banks, suppliers, and other private. These 10 sub-heads constitute the public and publicly guaranteed debt. Private non-guaranteed debt is projected separately. Debt outstanding and disbursed (long-term) constitutes public and publicly guaranteed debt and private non-guaranteed debt. Finally, the total debt stocks are arrived at by adding debt outstanding and disbursed (long-term) to the use of IMF credit and short-term debt.

The external debt and balance-of-payments projections of the optimistic scenario have the following broad assumptions: (a) the stabilisation induced recession in the economy lasts till 1992/93; (b) the import growth during the period (1992-93 and 1993-94) averages around 13 per cent and the exports grow at 10 per cent; (c) between the period 1994/95 and 1998/99 both imports and exports witness sustained growth and average 16 and 15 per cent respectively; (d) from 1999/2000 the export growth averages 20 per cent while the import growth is placed at 13 per cent, hence the resource balance is declining throughout.

Between 1992 and 1994 because of substantially lower level of current account

Source: The balance of payments data except for interest payments and principal repayments are from the Reserve Bank of India, Annual Reports (various issues). The data on interest and amortisation payments are from the World Debt Tables, 1992/93

deficit, the reserves actually get boosted Between 1995 and 1999 the total capital account is unable to finance the current account deficit and hence the reserves get depleted Finally in the last two years the current account deficit gets reduced considerably (primarily because of high export growth) and the total capital account being higher than the current account requirement, reserves again get boosted The contraction of additional or new debt every year is based on the level of current account deficit and the disbursement schedule of commitments of previous years

The total debt stocks (EDT) in the optimistic scenario (OS) of the external debt projections rise from $ 76 6 billion (bn) in 1992/93 to $ 91 9 bn in 1996/97 and to $ 104 5 bn in 2001-02 (refer to the debt projections-optimistic scenario) While the disbursements in this scenario are projected to be rising steadily, the debt service from the year 1995/96 goes up considerably (bunching of repayment obligations to the private creditors, especially the commercial banks refer to the break-up principal repayments) As a result the net transfers become negative from 1996/97 However, during this period, there is relatively large inflow of foreign investment The net transfers with regard to IBRD, bonds, and commercial banks are negative throughout the period By contrast, IDA, concessional bilateral, and other private have positive net transfers over the projected period

Debt outstanding and disbursed (long-term) goes up from $ 68 9 bn in 1992/93 to $ 81 8 bn in 1996/97 and to $ 97 1 bn in 2001-02 On an average, 67 per cent of the DOD is on account of official creditors and the remaining on account of private creditors Of the total debt stocks, the concessional component (multilateral and bilateral) averages around 43 per cent over the projected period Debt owed to multilateral creditors averages around 35 per cent Interestingly the borrowings from the commercial banks, having seen a sustained rise over 80s, are projected to go down throughout the period For instance, the DOD commercial banks is $ 6 5 bn in 1992-93 and then falling to $ 4 6 bn in 1996-97 and to $ 0 3 bn in 2001/02

In the optimistic scenario, the debt service ratio (TDS/XGS) is quite high till 1996/97 It is averaging around 27 5 per cent However, for the period 1997/98 and beyond till 2001/02 the debt service ratio is seen to decline and is averaging 22 4 per cent for this period The current account balance/exports ratio (CAB/XGS) having come down sharply in 1991/92 picks up steadily up to 1996/97 and reaches a peak of 29 per cent For the subsequent period, however, the CAB/XGS ratio declines throughout, and is placed at 10 per cent

Source *Economic Survey*, 1992-93

1/02. The total debt stocks/exports ratio (EDT/XGS) is seen to decline all through the projection period From being 283 per cent in 1992/93 the EDT/XGS ratio falls to 232 per cent in 1996/97 and to 124 per cent in 2001/02 The concessional component of total debt stocks, that is, concessional multilateral and bilateral is seen to average 43 per cent over the projected period The multilateral component of total debt stocks, that is, multilateral concessional and non-concessional is averaging around 36 per cent over the projected period

The inflow of foreign direct investment is very small until 1994/95, between $ 200 mn and 400 mn but then picks up from 1995/96 Till the end of the projection period the yearly average inflow of foreign investment is $ 2 0 bn Perhaps, a lot more needs to be done in order to change the mind-set of the foreign investors as far as investing in India is concerned The advantages of investing in India need to be advertised much more aggressively and our track record of honouring all external payment obligations at all times has to be emphatically conveyed Also, financial sector reforms would help attract potential foreign investors

Some mechanism needs to be evolved for reducing or at least not letting the amount of undisbursed debt go up As of fiscal year 1992/93, the total undisbursed debt is of the order of $ 24 5 bn Most of the undisbursed debt is the project tied IBRD loans or IDA credits One such mechanism to control the amount of undisbursed debt is to channelise larger funds from the World Bank through lines of credit in ICICI, IDBI, NABARD and such other financial institutions Since the disbursement of loans and credits to these financial institutions is not linked to project implementation, there would normally be no undisbursed debt as far as these institutions are concerned

The external debt and balance-of-payments projections of the pessimistic scenario (PS) have the following broad assumptions (a) the stabilisation induced recession in the economy lasts till 1993/94, (b) the import growth during this period averages around 13 per cent and the exports grow at 10 per cent, (c) up to the fiscal year 1995/96 both imports and exports witness sustained growth and average 15 and 13 per cent respectively, but due to the recession the current account deficit till 1995/96 is below the level obtaining in 1990/91 Because of lower levels of current account deficits till 1995/96, and higher levels of disbursement of external funds, the reserves actually get boosted From 1996/97 onwards till 1999/2000 the import growth is averaging 17 5 per cent while the exports grow at 14 5 per cent With the invisibles turning negative the current account deficit rises sharply The import growth in the last two years of the projection period is brought down to 13 per cent since the required export growth is not materialising The repayment obligations from 1996/97 rise substantially with bunching of repayments to the IMF and commercial banks The reserves are depleted throughout the period

The total debt stocks (EDT) in the pessimistic scenario (PS) of the external debt projections rise from $ 76 6 bn in 1992/93 to $ 92 3 bn in 1996/97 and to $ 116 6 bn in 2001/02 (refer to the debt projections—pessimistic scenario) Although the disbursements in this scenario are growing steadily, they are barely sufficient to meet the debt service requirements From 1996/97 the debt service requirements shoot up considerably due to the clubbing of repayment obligations to the private creditors (refer to the break up of principal repayments) The net transfers, as a result, become negative for IBRD, non-concessional bilateral, bonds and commercial banks (refer to the break-up of net transfers) By contract, IDA, other concessional multilateral, concessional bilateral, and other private have positive net transfers over the projected period

Debt outstanding and disbursed (long-term) goes up from $ 68 9 bn in 1992/93 to $ 84 1 bn in 1996/97 and to $ 105 4 bn in 2001/02 On an average, 64 per cent of the DOD is on account of official creditors and the remaining on account of private creditors Of the total debt stocks, the concessional component (multilateral and bilateral) averages around 42 per cent over the projected period Debt owed to multilateral creditors averages around 33 per cent By contrast to the optimistic scenario, the borrowings from the commercial banks are seen to be rising throughout the projected period For instance, the commercial banks disbursement is $ 204 mn in 1992/93, $ 1 4 bn in 1996/97 and $ 3 4 bn in 2001/02

In the pessimistic scenario, the debt service ratio (TDS/XGS) is hovering around 28 per cent till 1996-97 However, for the period 1997-98 and beyond till 2001-02 the debt service ratio declines to 25 per cent The current account balance/exports ratio (CAB/XGS) rises steadily all through the projected period From 15 per cent in 1992-93, the CAB/XGS ratio rises to 21 per cent in 1996-97 and to 28 per cent in 2001-02 The total debt stocks/exports ratio (EDT/XGS) is seen to decline over the projected period From being 283 per cent in 1992-93, the EDT/XGS ratio falls to 226 per cent in 1996-97 and to 159 per cent in 2001-02 The concessional component of total debt stocks, i e, concessional multilateral and bilateral is seen to average 42 per cent over the projected period The multilateral component of total debt stocks, i e, multilateral concessional and non-concessional is averaging around 34 per cent over the projected period

In the pessimistic scenario the stabilisation programme currently underway gets delayed and consequently the recession lasts longer. The revival of growth is slow Measures need to be taken to promote domestic investment Credit squeeze needs to be relaxed so as to raise the supply of investable funds The prospects of attracting large FDI flows is rather bleak in this scenario A comprehensive and sustained effort is required for changing the perceptions of foreign investors Equity flows are required to replace debt flows since this scenario suggests large contraction of external debt by mid- and late-90s

The required export growth after 1996-97 is to be in the region of 20-22 per cent in order to sustain the emerging debt situation, and if this does not materialise, as is the case in the pessimistic scenario then some form of import control would become necessary Besides, private creditor debt cannot be raised in large amounts for the period beyond 1996-97 since financing persistent and large current account deficits through them would eventually lead to an unsustainable debt situation In case of such an outcome, either non debt creating flows, such as foreign direct investment can help alleviate the burden or curbing the import demand

Notes

1 Low income countries are those in which 1991 GNP per capita was no more than $ 635
2 Middle-income countries are those in which 1991 GNP per capita was more than $ 635 and less than $ 7 910
3 *World Debt Tables 1992 93* Vol 1, p 155
4 *World Debt Tables 1992 93* Vol 2, p 194
5 World Bank, *World Debt Tables 1992 93*, Vol 2 p 194 Data include non resident Indian deposits for March 1980 March 1992 These deposits amounted to approximately US $ 9 2 billion as of March 1992 as compared to US $ 12 8 billion as of March 1991 The debt on account of NRI deposits is included in the category of 'private creditors"
6 *Economic Survey* 1992-93, p 118
7 With a view to have greater consistency and transparency in the external debt statistics of India, the RBI along with the ministry of finance set up a task force and a policy group on the external debt statistics of India The group submitted its report on March 31, 1992 The policy group/task force has drawn extensively on a report of an international working group on external debt statistics This group comprised of the World Bank, International Monetary Fund, Organisation for Economic Co operation and Development and the Bank for International Settlements
8 Short term debt include all debt with a maturity period of less than one year Includes NRI deposits up to one year maturity

Public Enterprises and Private Purposes

Ramaswamy R Iyer

I HAVE read with considerable interest Sudip Chaudhuri's article 'Public Enterprises and Private Purposes' (*EPW*, May 28) At the outset (particularly in view of the criticisms I am going to make later in this note) let me establish my credentials as a friend and not a foe of public enterprises (PEs) As Secretary of the Economic Administration Reforms Commission (the Jha Commission) I played a not unimportant role in the preparation of its reports including four on PEs (three of which have been cited in the references at the end of Chaudhuri's article) I also made a systematic attempt in my book *A Grammar of Public Enterprises Exercises in Clarification* (Rawat Publications, Jaipur, 1991, under the auspices of the Centre for Policy Research, New Delhi) to analyse and dispel the persistent confusions, errors and fallacies that characterise much of the thinking and writing about PEs (Chaudhuri, who too has tried to discuss some wrong assumptions about PEs, has probably not seen my book)

I am broadly in agreement with Chaudhuri s proposition that PEs have not received the right kind of support from the government (The fact that PEs have in the past had relatively easy access to capital funds from the government budget does not imply 'the right kind of support') I am also in agreement with the thesis that PEs have been used for private purposes This was so particularly from the mid-70s onwards when a process of subversion of all institutions began, and as a part of that process PEs came to be regarded as channels through which money could be collected (for whatever purposes), and also as instruments through which certain political purposes could be served As a corollary, appointments to the top posts in 'important' PEs began to be governed by considerations other than those of the requirements of the job While those tendencies perhaps abated somewhat later on, it cannot be said that they have disappeared, in fact some of them have become common form and have lost the power to shock

In spite of that general agreement in broad terms, I find myself not wholly comfortable with Chaudhuri's diagnosis and prescriptions, for two reasons

First, 'the lack of adequate governmental support' and 'the use of PEs for private purposes' may be true, but not universally they have affected some PEs more than others And I would be somewhat chary of recommending a larger planning role for the government in relation to PEs In my view, the central problem that has both constrained and distorted the performance of PEs in this country is an unhealthily close, dysfunctional relationship between them and the government—the absence of a proper *operational distance* between them It is this which has prevented PEs from functioning in a businesslike, enterprise-like manner, with all the speed, flexibility, decisiveness and innovativeness that imply This is the crucial difference between PE managers and those in the private sector, and not any inherent difference in ability or efficiency and this explains why PE managers are in demand in the private sector whenever large new projects are undertaken in the latter, and why, when they move over, they do very well This is a larger explanation which subsumes the thesis of 'use for private purposes' If a proper operational distance had been maintained from the beginning, such use would have been very difficult it is the closeness of the relationship which has facilitated such distortions (Of course now that those distortions have set in they themselves would become the reason for resisting the idea of 'distancing') As for 'adequate support', that would be nice for PEs to have, but it is less important than the freedom to function

That is a very compressed account of a complex problem with several aspects and dimensions I cannot elaborate on that theme here I can only invite attention to my book (referred to earlier) in which it has been dealt with at length

My second difficulty is that some of the illustrations that Chaudhuri uses to support his thesis show an imperfect understanding of the matters involved and an uncritical acceptance of some explanations which have been current, particularly in relation to certain developments in the fertiliser sector in the 60s and 70s For instance, he seems to be under the impression that most of the problems of the public sector fertiliser projects undertaken in the 60s and early 70s were due to the lack of adequate governmental support for the Fertiliser Corporation of India (FCI) and its Planning and Development Division (P and D) I know that such a view has been argued by some, but the reality was far more complex If a whole series of fertiliser projects ran into horrendous time and cost overruns and serious commissioning and operating problems, this was due to a combination of several factors

(i) An ambitious attempt on the part of the FCI to take on several projects at the same time or in quick succession, with hardly any experience in project planning or management

(ii) A strong (doubtless well-intentioned and patriotic) desire to do this on its own without external management support P and D and in particular K R Chakravorty were vehement advocates of such a view

(iii) The poor quality of project preparation in those years Major investment decisions were taken on the basis of sketchy and slipshod feasibility reports

(iv) The absence of adequate managerial talent FCI/P and D had many excellent engineers but relatively few good managers

(v) Unbusinesslike approach and methods There was no unified overall responsibility for project management, no proper control and review systems and no sense of urgency or of the value of time

(vi) The severe foreign exchange constraint (and the difficulty of getting project aid funds for public sector projects in those years) led to the allocation of foreign exchange by the government from diverse sources (like a patchwork quilt), making it very difficult if not impossible to tap the best or even second-best sources of know-how, engineering, contracting and equipment This was compounded by the difficulty of integrating equipment from multiple sources

(vii) Rupee resource constraints (and too many projects) led to sub-optimal budgetary allocations, leading to delays and cost increases

(viii) There was a multiplicity of objectives The timely and successful completion of fertiliser projects was not the only or even primary objective either of the government or of the FCI They were simultaneously concerned with developing indigenous know-how and engineering capabilities, learning management by doing, buying plant and equipment from indigenous sources (BHEL, BHPV, etc), which were themselves in the process of learning and developing, locating plants in difficult areas for the purpose of balanced regional or backward area development, trying out catalysts developed by P and D (their claims in this regard at that stage were rather exaggerated), generating employment (which meant employing far larger numbers than

necessary), experimenting with unproven technologies (e g, coal-based fertiliser projects at Talcher and Ramagundam) and so on The surprise is not that many projects failed but that some had even a modest degree of success

If we contrast this with the handful of relatively successful non-FCI projects—IFFCO's Kandla/Kalol Project, Madras Fertilisers, Bhatinda/Panipat, etc—we can immediately see the crucial difference In each of these cases, quick, successful project completion was the prime if not the sole objective, foreign exchange was available from one or two good sources, facilitating good technology and equipment choices, proven technologies were adopted (in the case of IFFCO, a smoothly running plant in the US was duplicated in every respect), and there were tight project management arrangements with a clear responsibility for timely completion (This was not merely a case of turnkey contracts or foreign managers Madras Fertilisers was under Amoco's management in the initial years, but IFFCO had an outstanding MD in Paul Pothen, in addition to some modest help from an American co-operative group and Bhatinda/Panipat had Engineers India as their Indian prime consultants working closely with Toyo Engineering)

Perhaps the kind of pioneering effort undertaken by FCI was necessary at one stage but there is hardly any doubt that it could have been better planned and managed and proved less costly to the country The effort at self-reliance and indigenous development could have been combined with a greater concern for good management, moderated by a realistic understanding of what was practicable within a given time-frame, and governed by a hierarchy of priorities among objectives In any case, the point that I am trying to make is that the theory that lack of support from the government was the main cause of all the troubles is wide of the mark A variety of factors were responsible, and FCI/P and D themselves, with their strong and sometimes politicised advocacy of doing everything on their own and their failure to appreciate the importance of good management, must bear a part of the responsibility It is even possible to argue that the government tended to place excessive reliance on the P and D's claimed capabilities

Chaudhuri readily accepts the thesis that it was hostility to the FCI/P and D that led to the reorganisation of the FCI This is again a myth which has somehow gained currency I knew the FCI very well in those years, and while it had many excellent people (with several of whom I formed friendships that have lasted down the years), it was a disaster as an organisation It was

impossible to imagine a more inefficient, lethargic, unbusinesslike, lackadaisical organisation. The ministry of chemicals and fertilisers despaired of being able to reform the FCI and make it more efficient. Initially, the finance ministry was in favour of strengthening without splitting, but eventually it came round to the view that splitting was inescapable. When Chaudhuri says: "Thanks ultimately to the support of some senior bureaucrats and technocrats, some of whom later joined organisations like Bechtel and the World Bank, FCI was actually split into several companies in 1978", I do not know whom he has in mind, nor why he supposes that those bureaucrats and technocrats were driven by suspect motivations. Why could they not have been genuinely convinced that a splitting was necessary? And what have their subsequent careers (assuming that Chaudhuri's remark is factually correct) to do with this? (Chaudhuri is perhaps echoing some articles which appeared in those years in which the whole issue was misleadingly presented as a conflict between bureaucrats and technocrats, and the then Secretary (C and F) was vilified.) Well, I was one of the bureaucrats involved, I could even be described as 'senior' (I was Joint Secretary and Financial Adviser, Ministry of C and F in 1976-78) and I did not join either Bechtel or the World Bank later; and all I can say is that there was a prolonged debate on the reorganisation of the FCI. Whether we now consider the decision right or wrong, it was taken with the best of intentions for what then appeared to be persuasive reasons. May I add that far from being hostile to the FCI I had grown attached to it with all its faults and would have preferred to see it retained as one unit and reformed; but I had to accept reluctantly that though this was a theoretical possibility, it would be an enormously difficult undertaking with uncertain prospects of success. Looking back on the decision now with the wisdom of hindsight, I am convinced that it was the right thing to do. At least Rashtriya Chemicals and Fertilisers and National Fertilisers (their Nangal unit) have prospered; this would have been very unlikely if they had continued under the umbrella of the erstwhile FCI. The mistake lay not in the splitting of the FCI but in the fact that having isolated the problem plants under the (residual) FCI and HFC, the government failed to tackle their problems, and allowed the two companies to become more and more sick. (The explanation for this was not malevolence, but partly the general bureaucratic sloth and indifference, and partly the intractable nature of the problems.)

The article argues that the delinking of P and D from the production units was wrong. That is a plausible point of view. On the other hand, there was a strong view even among those who had some sympathy for P and D that there should be a *contractual* relationship between the project owners on the one hand and the consultants/engineers/project managers on the other, and that this was not possible so long as those services were provided by an in-house division. Precisely the same thing was done in the steel sector, and for similar reasons: the CEDB of Hindustan Steel became what is now known as MECON. MECON has grown and prospered. Engineers India was a separate company right from the beginning and it has been one of our successful PEs. If P and D (now PDIL) has not been able to do well, the reasons must be found elsewhere and not in the fact that it was separated from the FCI.

Another questionable remark is that "there are indications to believe such allegations", i e, the allegation that the government went in for 1,350 TPD capacity ammonia plants to "basically side-track P and D". I am amazed at the confidence with which such an assertion is made. Chaudhuri should have shared those 'indications' with his readers. I know that the then Secretary (C and F) agonised for a long period over the choice between continuing with 900 TPD capacity plants and making the change to 1,350 TPD, and came up with different answers on different days during informal discussions; ultimately he settled for the 1,350 TPD capacity. Of the many considerations that went into that decision, side-tracking P and D was not one. Certainly the choice was a debatable one. There was support for both options at the time: it was possible to argue either case. In retrospect it may now seem to some that we would have been better off if we had settled for 900 TPD; but the question is whether the decision was a *defensible* one at the time. I believe it was. Allegations of improper motivation had no basis.

Having taken the decision in favour of 1,350 TPD, it was also decided (on the basis of the recommendations of two committees) that a certain methodology would be followed for the selection of the prime consultant for the first two plants; that the technology would be standardised for the ensuing six to eight plants, so that while much of the equipment would be imported for the first two plants, indigenous equipment manufacturers would be able to supply an increasing proportion of the equipment for the succeeding plants; that P and D would be associated with the foreign prime consultant right from the start so as to enable them to play a major role in the plants after the first two; and so on. Unfortunately those ideas, and in particular that of standardisation, ceased to be of any consequence after the change of government in 1980 and the increasing ascendancy of Snam Progetti. I need not go into that well known story.

Let me turn to other matters. The article says: "There is, however, hardly any forum where an investment project is evaluated from the point of view of the public sector as a whole." That is not quite true. The Public Investment Board (PIB) which was set up in 1973 is serviced by (among other agencies) the Project Appraisals Division of the Planning Commission and (unless there has been a change since my time) the PAD submits an *economic appraisal from the point of view of the national economy*. In addition to this, the strong past insistence on 'the indigenous angle' and the stringent control over imports took care of the interests of all public and even private sector manufacturers who could supply the equipment needs of a project. It is in fact possible to argue that we tended to overdo this.

In Note 10 to the article, a reference is made to the point that privatisation is often recommended on the ground that it will eliminate political and bureaucratic interference. This argument may seem specious but it cannot be dismissed lightly. I myself believe that the performance of PEs can be improved without privatisation, and that a good part of the reform will have to be undertaken in the government at both the political and bureaucratic levels. At a recent seminar in Hyderabad, I outlined a series of measures that need to be taken, and concluded by observing that if those measures were not found possible, there would be no alternative to privatisation. A British participant told me that he disagreed with all my propositions except the last one: his point was that reform was not possible and that privatisation was the only way out. That is a counsel of despair but I cannot say that it has no validity. The most plausible argument in favour of privatisation is that it would at least remove one area from the ambit of exercise of patronage and corruption by the powers that be. Unfortunately, the same forces which prevent reform and 'distancing' will also resist privatisation. Frankly I do not know the answer to that conundrum.

One final comment. I must enter a caveat on the reference to V Krishnamurthy. I think it is improper to refer to the registration of a case by the CBI as if that establishes guilt. If Krishnamurthy has been guilty of improprieties, it is for the courts to say so. Meanwhile, may I say that he was indeed one of our ablest managers? His contributions to BHEL, Maruti Udyog and SAIL need to be remembered, whatever the outcome of the cases now in progress.

Freedom from Drought and Thirst

Water conservation to fight scarcity - Steps taken by the Govt. of Maharashtra.

Shri Sharad Pawar
Chief Minister, Maharashtra

Highlights :

- The State Government has launched a crash programme of water conservation to fight recurrence of scarcity and shortage of drinking water.
- A boost to soil conservation, social forestry, minor-irrigation programme and underground bandharas by preparing integrated watershed development projects in 6,439 villages.
- Lift irrigation schemes in Adivasi area are undertaken with the help of voluntary organisations.
- A campaign of tree plantation, as a first step towards waste land development.
- A special programme is undertaken for strengthening of drinking water sources through Ground Water Survey machinery in 452 villages by using non-traditional systems like Bore Facture ceiling or blasting
- Water conservation works are in progress in 1,211 villages during the current year.
- The State Government has taken a decision to hand over water conservation works in 10 percent villages of the total number of villages selected in each district.
- The Water conservation works like farmponds, underground bandharas, Gabian bandharas are in progress under the watershed development programme. Grant-in-aid is given to the extent of 80 per cent.
- Special programme of raising ground water level is undertaken in the earthquake affected areas in Latur and Usmanabad districts.
- A complementary programme of social forestry is undertaken in 49 rehabilitated villages.
- A state-wide crash programme of water conservation to meet drinking water shortage in villages which are supplied water through tankers and bullock carts is launched.
- Ideal village projects are being implemented in 227 villages as part of the August Kranti Golden Jubilee Year Celebrations.

Poor Pay the Price

The eagerness of the minister of agriculture, and indeed of the government in general, to promote crop exports, including exports of foodgrain, betrays disregard of the likely decline in food availability for the poorest and the most vulnerable groups in the population 2261

Technology: The Choices

The emerging global scenario offers little scope for countries like India to break out of the technological monopoly/control of the advanced countries and their MNCs, but the potential nevertheless exists for evolving alternative technological paradigms based on contemporary advanced knowledge which widen the choice beyond that between accepting a junior partner role and embarking on an autarkic reinventing-the-wheel path M-102

Learning Curve

Census data show significant variations across taluks in literacy achievement in Tamil Nadu in the period between 1971 and 1991 Mapping these variations can provide a basis for discerning the existence of systematic patterns and association between educational performance and socio-economic factors 2290

Victims

A study of the impact of the post-Babri masjid riots in Calcutta on the informal sector brings out that the part of the informal sector tied to the formal sector suffered a greater loss of economic viability than the independent units 2299

Success Story

Why have sugar co operatives done so outstandingly well in south Gujarat and Maharashtra? M-129

Backward?

The July 25 notification of the Karnataka government on reservation for so called backward classes shows once again how the dominant castes hold sway in the state's politics 2270

Lessons for Privatisation

As many state governments are contemplating sale of equity in their public enterprises the contrasting experience of privatisation of two state government enterprises in UP may hold some useful lessons M-120

Beyond the Pale?

State level public enterprises are important instruments of public policy for the state governments and no reform programme can succeed unless these enterprises can be rendered viable A study of the financial record and related aspects of state public enterprises M-115

Lost Gloss

The prime minister's August 15 speech with its sabre-rattling directed at Pakistan and its cataloguing of shop-worn populist schemes, was a clear expression of how the government and its economic reform programme are nearing the end of their tether 2266

How Dispersed?

A study of the economies of 20 states over the period 1960 61 to 1989 90 shows that the acceleration in economic growth is spatially dispersed and covers about two thirds of the national economy 2303

Expendable

Cotton hank yarn of lower counts used to produce lower quality handloom cloth is subject to higher short run price instability than higher counts yarn because the spinning mills treat its production as a residual activity M-136

Unwelcome

It has not appeared in our press, but the government turned down a request by the Special Rapporteur on extra judicial summary and arbitrary executions' appointed by the UN's Economic and Social Council to visit India 2265

Accountability

Eleven years after the Economic Administration Reforms Commission's superb report on the subject there has not been an iota of improvement in the accountability of government officials and departments An examination of the reasons and a practical plan to achieve greater accountability M-109

Water Management

The growing problems of providing adequate drinking water to urban populations are a consequence of the lack of long term planning and inefficient management of urban water usage 2272

War to Order

The most powerful western countries led by the US manipulated the UN to bring about the Gulf War without exploring the possibilities of a peaceful settlement of the regional conflict 2277

How Replicable?

South Korea s transformation from one of the poorest countries in the world 40 years ago is rooted in special historical factors which predate its current export-oriented, liberal policy regime 2275

LETTERS TO EDITOR

A Correction

MY review of Jagdish Bhagwati's book *India in Transition* ('In Praise of Reform', *EPW*, May 14) contains an error which needs to be corrected, even though it does not invalidate my argument

In the course of his indictment of India's adherence to central planning and physical controls, Bhagwati had castigated the writings of Lange and Lerner for asserting that centralised planning would work better than a decentralised market system He cited a "seminal" paper by Hayek, entitled 'Economics and Knowledge' which showed the "illogicality" of their position I had pointed out that the Lange-Lerner system was conceived as a decentralised mechanism possessing the virtues of the market and that in any case it was not relevant to a discussion of the Indian control regime In a lengthy end-note attached to this discussion, I had (correctly) pointed out that 'Economics and Knowledge' did not deal at all with the Lange-Lerner mechanism, and that "it was first read at the London Economic Club in November 1936, while Lange's essay was published in 1938 and Lerner's *Economics of Control* in 1944 The mistake which must have been spotted by many readers, was to cite the versions of the Lange Lerner model that were published in book form The original versions in fact appeared in companion papers in the October 1936 issue of the *Review of Economic Studies* where Lerner sharply criticised some aspects of Lange's original formulation Since the *RES* was published from Hayek's own institution the London School of Economics, and since Lerner was at that time also on the LSE faculty it is quite likely that Hayek was aware of the model when he delivered the lecture on 'Economics and Knowledge' However, the fact remains that this paper did not mention Lange and Lerner or the "socialist calculation debate" in which Hayek was already an active participant It was only in his later writings that he took up cudgels against their mechanism, developing an idea that he had expressed in 1936 in a different context

All this does not affect the main point I was making, that the Lange-Lerner model cannot be regarded as an exemplar of centralised planning and physical controls, and dragging it into a discussion of Indian Planning was quite unnecessary in the first place Inaccurate citations in footnotes by both the author and this reviewer further muddied the water on this particular issue

Delhi

Extension Effort for Watershed Development

WATERSHED development is considered to be the appropriate strategy for dealing with the problem of drought and dry land agriculture on a long-term basis To verify the thesis in an empirical manner, I undertook a survey of eight watershed development projects in Shirur and Baramati talukas of Pune district which are drought prone areas The study led to the interesting conclusion that watershed development by itself would not be adequate

The facts show that watershed development does lead to improvement of water-table and moisture conditions but this does not necessarily result in increase in net returns and employment nor does it improve the financial position of the farmer Watersheds merely increase the potential of farm operations

A missing link between the improved water-table conditions and benefits to the farmers seems to be the lack of evolution of an optimal cropping pattern after watershed development If the cropping pattern continues on the traditional lines, the benefits from improvement in moisture conditions as a result of watershed development would not accrue

A number of measures should, therefore, be taken after watershed development to improve agricultural extension services for introduction of new dry land farming techniques and conscious effort for the economic use of water in the post-watershed development period These supplementary measures should be identified as priority areas

There is also a need to strengthen the financial infrastructure The lack of adequate financial resources does come in the way of change in cropping pattern and diversification of the crops in watershed areas and improvement in the employment of farmers Thus investment for watershed development should be combined with provision of current finance for improvement in agricultural techniques and crop diversification

Without the complementary measures listed above, watershed development will not deliver the goods

ECONOMIC AND POLITICAL WEEKLY

Current Account Convertibility

WITH a series of measures already effected to liberalise exchange controls and with the operation of the market-determined exchange rate system since March 1993, the announcement by the Reserve Bank that, effective from August 20, the rupee became fully convertible on current account and that India accepted the status and obligations of Article VIII with the IMF was very much a formality. It is obviously the continuation of the process of globalisation and integrating the Indian economy with the world economy, which the government and the RBI have set before themselves as their objective. However, even conventional wisdom, much of it emanating from the IMF, emphasises certain pre-conditions for the introduction and successful maintenance of convertibility. Domestic price stability without administered price controls, appropriate macro-economic policies, particularly monetary stabilisation and fiscal consolidation, a realistic exchange rate for the currency and adequate foreign exchange reserves are considered major prerequisites.

The government will claim that these pre-conditions have been met, but this is not entirely convincing. The inflation rate has certainly been higher than that of the country's trading partners. With a massive revenue deficit financed by government borrowing, it cannot be said that fiscal consolidation is in sight either. Monetary stability has also been disturbed by the flow of foreign exchange from portfolio investment in the share market by foreign institutional investors (FIIs), Euro issues in the form of global depository receipts (GDRs) and Euro-convertible bonds by Indian corporate bodies and the low level of import surpluses as a result of the recession in Indian industry (under all these heads, some of the inflow may represent a reverse flow of earlier capital flight). The bulging foreign exchange reserves, nearing $ 18 billion, are cause for much self-congratulation in the government, but these reserves are not the outcome of an enduring growth of export-import volumes and large foreign direct investment (FDI) reflecting rising levels of domestic economic activity.

In sum, the abundance of foreign exchange assets notwithstanding, it cannot be gainsaid that the fundamentals are not right for the country to be pushed into current account convertibility and embracing Article VIII status with the IMF. The government has nevertheless taken the step because there are a variety of compulsions which developing countries like India are subject to, particularly because the IMF is using its clout to achieve its global aims irrespective of the repercussions on the social and economic circumstances of individual countries. Initially the pace of acceptance of Article VIII obligations was slow with considerable caution exercised even by industrial countries, the bulk of whom did not opt for Article VIII status until the early 1960s. Many of the successful east Asian countries like South Korea, Indonesia and Thailand accepted the obligations only during 1988-90. For about 22 years between 1970 and 1992, there were only about three countries a year accepting the special status. But in 1993, the number rose to eight, bringing the tally of countries sporting Article VIII status to 82. And in 1994 already 10 countries have embraced Article VIII, India being the 92nd country out of 178 IMF members. Even poor and vulnerable countries such as Nepal, Bangladesh, Pakistan and Sri Lanka as also many African countries have been made to accept these obligations. All these countries have been subjected to the severe conditionalities attached to the IMF's enhanced structural adjustment facilities (EASF) meant for the poorest countries.

India's case falls substantially under the same category. With the stabilisation and structural adjustment programmes initiated under IMF and World Bank direction, the Indian government has opted for a liberal policy regime in every respect. On matters relating to exchange controls, radical changes have already been effected. The government had thus already come very close to current account convertibility before the finance minister announced in his 1994-95 budget speech that India would move formally towards convertibility on current account. In fact even in regard to the capital account, the economy has been opened up significantly with automatic facilities for inward and outward remittances of both capital and current income relating to companies' foreign borrowings, foreign direct investment and, above all, portfolio investment in the Indian share market. Exporters and NRIs are also allowed to retain foreign currency accounts. The remaining restrictions on remittances relating to interest income earned on non-resident non-repatriable deposits, as also investment income by non-resident Indians (NRIs) or overseas corporate bodies (in phases) have now been removed.

The removal of bureaucratic controls implicit in the exchange control regime which served no particular social purpose is no doubt welcome. But the decision to seek Article VIII status is a different matter altogether. There is a degree of irreversibility about it and many options otherwise available to the country get foreclosed. For instance, in the face of continuing rise in foreign exchange reserves, the RBI may not be able to keep supporting the foreign exchange market and some appreciation of the rupee may ensue. In the circumstances, exporters may have to be compensated selectively with export incentives, but Article VIII status prohibits such action except for a brief and temporary period and only with the permission of the IMF. Above all, the acquisition of large reserves through expensive and possibly volatile capital receipts should not lead us to believe that the country has achieved a strong balance of payments position. Sustained export growth of a reasonable magnitude of, say, 15 per cent per annum in dollar terms is yet to be reached. The required infrastructural facilities are not in place and will require quite a few years to be created. If in the meantime overall domestic demand does pick up, export growth might well be affected. There are also the large external debt service obligations to be reckoned with.

The argument that accepting Article VIII obligations inspires confidence in the international community that the country will pursue 'sound' economic policies and eschew restrictions on payments and transfers for current international transactions is not convincing. Confidence is more a matter of how fundamental aspects of the balance of payments are tackled. Many countries like South Korea, Indonesia and Thailand attracted substantial foreign investment before they had accepted Article VIII obligations. On the other hand, premature surrendering of the leverage available for special exigencies can prove a grave handicap which will be only partially mitigated by the availability of the IMF's financing schemes for such eventualities.

POLITICS

Unsustainable Postures

THE fortnight-old boycott of parliament has been ended by what has been generally perceived as the backtracking of the opposition on the basis of some 'face-saving' concessions made by the government. The boycott was preceded by a week of sustained obstruction of the business in both the houses, followed by walk-outs every day. The retreat of the opposition was perhaps unavoidable as it had reached a dead-end more than the ruling party. Cynics may add that the financial losses incurred by the opposition MPs, and some of the opposition parties which impose a levy on the parliamentary allowances of their MPs, were also proving to be a strain. Basically, the discomfiture of the opposition due to the climb-down represents the wages of unthinking resort to unsustainable aggressive posturings. Boycott of parliament by itself is a self-disarming exercise for the boycotters. In the absence of the opposition the ruling party can carry on with its business, perhaps more conveniently, if only with some embarrassment, while the opposition deprives itself of a very important strategic arena for harassing the government. The boycott can be fruitful only when the opposition is reasonably hopeful of pushing the government into a corner by forcing the dissolution of the house or compelling the government to concede its principal demands by militant mass actions. The opposition in the Indian parliament at the moment is incapable of either. The leaders of most of the major opposition parties are on record that an early poll will not be acceptable to the people and that their own parties are not really prepared to face it. Indeed, it is the prime minister who has started an intimidation campaign with threats of an early poll.

Moreover, the heterogeneous composition, with sharp differences among the different parties and new fissures in the Janata Dal, cannot really qualify the opposition to launch and develop effective mass actions. Indeed a large part of the opposition cannot but feel uncomfortable in the company of the largest opposition party, the BJP, even in the limited 'unity in action'. It must be feeling even more dismayed by the second front opened by the BJP at Hubli on August 15.

One can also draw lessons from some historical precedents. In ancient Rome in 121 BC, democratic and egalitarian forces led by Gaius Gracchus withdrew from the Senate and seized the Aventine, the most southerly of the seven hills of Rome and prepared to face the Roman Establishment's armed onslaughts. Though Gracchus' forces were in the event defeated and most brutally massacred, the impact of this struggle subsequently led to the development of a broad revolutionary movement among the peasantry and the city poor all over Italy.

The second 'Aventine', two thousand years later, was an unmitigated fiasco. After the reformist Socialist deputy Matteoti had been murdered by fascist thugs following his courageous exposure of Mussolini's rigging of the parliamentary elections of April 1924, various political parties in the opposition decided to withdraw from parliament in protest, in a move subsequently designated as the 'Aventine'. These parties were far from united either in their objectives or their methods of struggle. Antonio Gramsci, then the leader of the Italian communists, proposed follow-up action by militant moves, including a general strike, which was turned down by the other 'Aventine' parties. "For months afterwards", according to an account, "the Aventine's activity was to consist of little more than abstract affirmation of principles and a monotonous chain of lamentations". While Gramsci's militant proposals have subsequently been criticised by some writers as unwarranted 'extremism', the inaction of the other parties was indeed revolting. Disgusted with their allies, the PCI deputies returned to parliament in November 1924 under humiliating conditions. They were later followed by the other parties. Some of them faced physical assaults by the fascist deputies. This chapter soon ended with Gramsci's arrest, notwithstanding his parliamentary immunity, and the subsequent outlawing of the PCI.

It is of course not intended here to draw a parallel between the Indian situation today and the Italian politics following Mussolini's coming to power. Neither is the Congress(I) a fascist party, nor does India face a threat of fascist takeover today. The point merely is that boycott of parliament is a very weighty question which cannot be treated lightly.

The question of adequate consideration of the boycott tactics apart, the opposition parties made a simple error in assessing the mood of the people. By contrast to the Bofors furore which paved the way for the Rajiv Gandhi government's ouster and the installation of the V P Singh government, the bank scam, its enormous scale notwithstanding, seems to have left the masses unmoved. Whether it is due to their failure to grasp the enormity of the crimes or a general indifference to the basic question of morality in public affairs remains to be ascertained. But this public apathy is a matter of great concern for the health of the Indian democracy. In this context, an even more fundamental question for the Indian polity today is for the Left parties to decide for themselves if they intend to play a leading and transformatory role in Indian politics or be content with functioning as a parliamentary party of the garden variety. This question arises because during the whole critical period, the Left/Communist parties have not distinguished themselves in any way from the others except perhaps for the repeated conciliatory gestures made by the two communist parties. There was no effort to take the issue to the people, except for some isolated and token gestures.

MAHARASHTRA

Too Much at Stake

THE gunning down of BJP corporator Ramdas Nayak in Bombay in broad daylight has focused public attention once again on the deep-rooted and growing links between the criminal underworld and the political leadership. The incident occurred on a heavily trafficked thoroughfare in the western suburb of Bandra, a section of which is being proposed as the financial centre of the future. While Nayak's assailants are still at large, there appears to be little doubt that it was a planned affair, probably executed by hired killers. Nayak's murder is in this respect no different from the other killings of party men over the last couple of years. In Nayak's case two things were different. One, he had the reputation of being a sort of clean-up man forever drawing attention to the garbage, as one speaker at the condolence meeting put it, whether on the roads or in public life, and a political image with as yet little to tarnish it; and secondly, his murder came at a time when public attention had already been drawn to corruption in high places, occurring as it did the day following the disclosures of a senior police official's court declaration alleging the chief minister's interference in police work concerning known big criminals. These factors combinedly resulted in the BJP, whose Bombay unit chief Nayak had been recently elected, using the occasion to reassert its three-pronged campaign—against corruption in high places, terrorism with international (Pakistani) connections and the nexus between corrupt politicians and criminals. While certainly all this constituted itself into an attack on the Maharashtra chief minister and his government's inability to govern, and therefore a demand for his resignation, the issues raised are far too substantial to be dismissed as opposition ploys.

There is little ground to dispute the contention that the criminal underworld, whether it is in smuggling or small time goondaism, could not have flourished as it has without the overt and covert protection afforded it by politicians. These elements have been used by politicians for a range of operations such as extorting funds ostensibly for the party, for enforcing the numerous bandhs, for mobilising crowds for public meetings, during election campaigns both to keep away certain groups as well as to facilitate the movement of others, and, as is becoming well known, to instigate mob violence. This has inevitably led to a legitimisation of violence in all spheres.

It is not without significance that the number of TADA cases in the state is among the highest anywhere, because the act provides an easy avenue for the police to terrorise people, especially minorities, even

while the big criminals continue to conduct business unfettered. While the chief minister has denied that there have been excesses by the police who appear to have had a free hand in selectively detaining people illegally after the bomb blasts of December 1992, there are pointers which indicate otherwise.

The protection that has been afforded to the underworld dons has resulted in a network which has played its role in every one of the public acts of violence. Following the death of Nayak for instance, there was much discussion about whether the AK-46 and AK-47 rifles which were used in the attack were part of the consignment of arms which had been smuggled into the country in connection with the bomb blasts or at some other point. Clearly it is the existence of the smuggling network originally for gold, electronic goods and later for drugs, etc, which made it possible for the bomb material and arms to be brought in then, as now. A much quoted report after the blasts was about how the policemen on duty at a particular post along the sea coast had stated they had seen the transfer of the consignment of smuggled arms from the sea but had dismissed it as being 'the usual smuggling activity'. While not every policeman in Bombay or the state had direct orders from political bigwigs to ignore or condone illegal activities, the ethos of turning a blind eye to questionable actions and events has become well-entrenched. And it is this substratum which has now made it possible for petty builders, industrialists or big time mafia dons and politicians to hire professional killers to deal with situations of all kinds—whether it is the awarding of a building contract, land deals, trade union troubles, or garden variety political confrontation. It is significant that the chief minister has taken his time over responding to the centre's directive to constitute a special squad to inquire into Nayak's murder. There is after all too much at stake.

ASSAM

Understanding Bodo Nationalism

MANY factors have contributed to the Bodo nationalistic assertion. It is necessary to understand them if one has to make some sense of the persistence of violence against non-Bodos in the Bodoland Autonomous Council (BAC) area. To see the violence as merely a calculated move to drive out non-Bodos and ensure that the Bodos would form a majority in the BAC area would be not merely a mechanical reading of a complex situation but would also be ignoring the hard demographic realities. The fact that the Bodo leadership has made several compromises does not affect the relevance of these factors which, to no one's surprise, have provided grist to the more extreme and quasi-separatist Bodo Security Force (BdSF).

Broadly speaking, these factors are: apprehension over loss of land (in many cases an accomplished fact); the distancing from Assamese nationalistic assertion which was seen with some justice as aggressively absorptive of smaller and materially less resourceful nationalities; the seemingly contradictory ambitions of the incipient middle class which is seeking what is its due in the Indian pie even while pursuing a (notional) dream of sovereignty and independence; the deep-seated fear of and animosity against the 'aliens' who, as the ABSU memorandum of January 1, 1984 shows, include not merely 'foreign nationals' but also 'non-tribal immigrants'; the antagonism towards migrant settlements coming up illegally in areas officially designated as tribal belts and blocks and such proximate living leading to further problems.

Every one of these apprehensions and grievances has contributed to the Bodo nationalistic assertion in a relatively moderate form; and the failure to attend to these grievances has directly contributed to the emergence of more extreme forms seeking a quasi-sovereign status for the Bodos.

A most disturbing fall out of the riots is the near-complete communal divide. Almost every Bodo leader has traced the origins of the riots to the combing operations launched in the wake of the killing of seven policemen on July 13 in which, it is alleged, the police incited minority youth to attack Bodo settlements. In contrast, the minority leaders are equally united in viewing the incidents as yet another pogrom against Muslims, though the minority leaders opposed to the Congress also see the hand of the government.

Apart from the ingrained flaws in Bodo nationalist aspirations which went beyond seeking to rectify injustices over land, the extremely opportunistic handling of these grievances and later the Bodoland agitation itself has also contributed to the present tensions. Though neither the Congress nor the AGP can claim a clean record on the handling of the Bodo problem, the greater culpability undoubtedly is of the Congress, under whose initiative the Bodo Accord was signed.

And yet, a curious feature of the Accord is that it is being implemented by a structure in which none of the signatories has any position. In the latest round of 'tripartite talks' in Delhi on June 13 on the implementation of the Accord, even ABSU, which carried on the agitation and whose leaders signed the Accord, was excluded.

The persistence of violence in the BAC area and the intensified virulence with open communal dimensions lay bare the flaws of the Accord and the opportunism on all sides that lay behind that hastily improvised deal. For, one of the key issues yet to be solved is the very area of the BAC. An Accord is signed; and an Act called the Bodoland Autonomous Council Act is passed by the state assembly and duly receives the president's assent. All the while the BAC area, "defined" as the "Bodoland Autonomous Council Areas in the Act", going little beyond the vague description in the Bodo Accord—"contiguous geographical areas between river Sankosh and Mazbat/river Pasnoi"—remains undefined.

The political fall out of the riots is likely to be rather unpleasant for the Congress. The communal polarisation has also touched the party; and there are indications of an "agonising reappraisal" by legislators from the minority community. The political beneficiary will be the AGP which has already made inroads into the so-called vote bank of the Congress. Rather tellingly for the minorities, during the rule of the AGP which came to power on a platform of detecting and deporting illegal aliens, there was hardly any complaint of harassment by the minorities.

A most ominous aspect of the riots is the repeated reference to the Inter-Services Intelligence (ISI) of Pakistan. The ISI is certainly active in the region; one would be surprised if it was not. However, this crying ISI even at proven failures of routine administration is likely to turn out to be a case of crying wolf too often.

Having said this, one has also to take note of possible future alliances. One of the achievements of Hiteswar Saikia, especially after the recent riots, is that the disparate opposition is united at least on this one point of holding Saikia and his handling of the Bodo problem responsible for the current violence. The political spectrum encompassing the CPI(M) and the AGP and forces beyond does appear lacking in coherence and by definition unstable. But stranger alliances have come together dictated by necessity. Is that the shape of things to come?

HUMAN RIGHTS

Caught in a Maze

ALTHOUGH the latest Amnesty International memorandum to the government of India following its January visit to Bombay this year does not add anything substantial to the findings published by various Indian human rights groups on the Bombay communal riots of December 1992/January 1993, it exposes one aspect of the aftermath which seldom finds a place in the national media—the police atrocities on innocent citizens in the wake of the Bombay blasts of March 12, 1993.

The despatch of the memorandum to New Delhi is timely. Bombarded daily by news of the arrests of suspects in the Bombay blasts, their trial, speculations about their conspiracies, their ties with Pakistan, etc, etc, the entire nation appears to have completely forgotten the events that preceded the blasts—the communal riots of December and January, which took a toll of 1,718 lives (according to Justice Shrikrishna Commission). It was a massacre of a wider

proportion, suggesting a conspiracy to selectively kill members of the minority community (often with the active connivance and participation of the police), than the mindless killing of more than 300 people by the Bombay blasts. This is of course not to underplay the gravity of the latter tragedy and the loss in terms of human lives. But if the state, the judiciary and the media are supposed to be fair and objective, one expects them to treat the organisation of the Bombay communal riots as an equally reprehensible conspiracy as that of the Bombay blasts. If alleged accomplices and providers of hideouts of those held guilty of the Bombay blasts can be arrested and put on trial, one wonders why self-confessed communal rioters like the Shiv Sena leaders and activists (who publicly bragged about their role in the Bombay riots) are let off.

Although the Amnesty memorandum does not go into this bias betrayed by the Indian government in its treatment of the conspiratorial nature of the two massacres in Bombay, it highlights the partisan and communal nature of the police administration by detailing cases of its misuse of power, and particularly TADA, against members of the minority community. According to the Amnesty's findings, a large number of people are routinely held in Bombay police stations without a proper record of their arrest or detention. Some detainees, the Amnesty team found, were women and children held as 'hostages' for several days to force the surrender of suspects in the March 1993 Bombay blasts.

The memorandum documents four specific examples of reported extrajudicial killings and 'disappearance' of Muslims by police during the riots. In response to these allegations, the Indian government has been claiming that it is investigating these cases. But even after two years, no police officers have been charged or brought to justice. In fact, the existence of the Justice Shrikrishna Commission is being used by the Bombay police and state officials as an "excuse not to proceed against individual policemen against whom there is evidence that they committed excesses".

The Amnesty memorandum has recommended, among other things, the establishment of a system of comprehensive police custody records to which outsiders should have access; an independent mechanism to scrutinise police behaviour in all Maharashtra police stations; review of the alleged abuse of the TADA; and immediate steps to prosecute police officers responsible for killing people deliberately and illegally during the December 1992/January 1993 riots. Quite predictably, the Indian government has dismissed the recommendations. Describing the government's response as "complacent", Amnesty International has observed that by rejecting the recommendations, the Indian government has "dismissed the need to tackle key problems such as wide-scale unacknowledged detentions, the routine use of torture or ill-treatment, and the broad police powers for using lethal force". As a result, it fears that the "serious human rights violations which occurred during the Bombay riots could happen again tomorrow".

Amnesty's fears are well-founded. But then it should remember that just as after all these years its first 'official research visit' to an Indian state—Maharashtra, in the present case—has been made possible because of pressures from Washington and the EEC on the Indian government, the only chance of its recommendations being accepted by New Delhi also lies in the capacity of these powers to twist the arms of the Indian government. A government, which till the other day was denouncing Amnesty's reports as part of a western-inspired conspiracy against its supposedly unimpeachable record on human rights, suddenly in the new era of 'economic liberalisation' decides to welcome Amnesty and allow it a peep into its cupboard of skeletons in Bombay. Is it just coincidental? It is common knowledge (as widely reported in the press) that the US and the EEC trade partners had been insisting on New Delhi's better behaviour in the area of human rights—as in economy and trade relations—in the new framework of structural readjustment. The term they use is 'transparency'—which is the euphemism for better access by western experts to the record of performance by the Indian state in the area of human rights, just as they insist on supervision of its performance in economy and trade relations.

Indian citizens are caught up in the maze of the old colonial legacy of submission to, and dependence on, the western dominating powers. Many among them face the bleak prospects of submitting to retrenchment and unemployment brought about by the 'new economic order', and still many, in places like Kashmir, the north-east, and communally sensitive, riot-torn areas depend on the arrival of western fact-finding missions (like the Amnesty) whom they welcome hoping that their reports about human rights violations by the Indian police would persuade their parent governments—the western states which underwrite India's development projects and ambitious defence plans—to put some pressure on New Delhi to stop the terrorism of its police and paramilitary forces.

HAITI

Harvest of Catastrophe

Frederic F Clairmont writes:

NOW that Uncle Sam and his ventriloquist dummies in the UN Security Council have decided to give the rabbit punch to Haiti it would be appropriate to recall the words of major-general Smedley Darlington Butler (1881-1940). Written with great power and poignancy, the virtue of the old leatherneck is that his language is stripped of bullshit, hypocrisy and sanctimoniousness. How refreshing compared to the garbage of a Clinton and his rantings on democracy:

> I spent thirty-three years and four months in active service as a member of our country's most agile military force—the United States Marine Corps. I served in all commissioned ranks: from a second lieutenant to major-general. And during that period I spent most of my time being a high-class muscle man for Big Business, for Wall Street, and for the bankers. In short, I was a racketeer for capitalism.
>
> Thus I helped make Mexico and especially Tampico safe for American oil interests in 1914. I helped make Haiti and Cuba a decent place for the National City Bank boys to collect revenues in. I helped purify Nicaragua for the international banking house of Brown Brothers in 1909-1912. I brought light to the Dominican Republic for American sugar interests in 1916. I helped make Honduras 'right' for American fruit companies in 1913. In China, in 1927, I helped see to it that Standard Oil went its way unmolested.
>
> During those years I had, as the boys in the back room would say, a swell racket. I was rewarded with honours, medals, promotions. Looking back on it, I feel I might have given Al Capone a few points. The best he could do was to operate his racket in three city districts. We Marines operated on three continents. (S D Butler, *War is a Racket: An Autobiography*, Round Table Press, New York, 1935.)

Smedley Darlington Butler was a professional killer in the service of Big Capital. Or better still, a high powered state terrorist. But one who spoke the truth towards the end of his life, and he deserves to be honoured for the position he finally took.

At least he had no need to bellow about 'human rights' and the need to make 'the world safe for democracy' as Woodrow Wilson was doing. In short, he had no need for the refurbished racist rationalisations of Woodrow Wilson's secretary of state, Robert Lansing, who gives us a precious insight into the dynamics of US imperialism. A view which no doubt would be shared privately by Clinton and his CIA and Pentagon cronies:

> The experience of Liberia and Haiti show that the African race are devoid of any capacity for political organisation and lack a genius for government. Unquestionably, there is an inherent tendency to revert to savagery and to cast aside the shackles of civilisation which are irksome to their physical nature. (Ulysses B Weatherly, *Haiti: An Experiment in Pragmatism*. New York, 1926. Quoted in Hans Schmidt, *The United States Occupation of Haiti: 1915-1934*, Rutgers University Press, 1971.)

Any more questions?

Somani Iron and Steels

SOMANI IRON AND STEEL, which is engaged in the manufacture of steel ingots, steel castings, forging steel and utensil grade steel, is entering the capital market with a public-cum-rights issue on September 5 The issue is to part finance the company's plans for augmenting its manufacturing facilities for producing various grades of steel like low carbon, high carbon, low alloy, high alloy, stainless steel, etc, from the present 50,000 mt to 3,00,000 mt per annum through modernisation and expansion It is also installing a 60 tonne UHP electric arc furnace with eccentric bottom tapping and water cooled shell, along with other arrangements which will be supplied by GEC Alsthom (India) and will have a matching size ladle refining furnace and 50 mvs furnace transformer to enable fast melting Further the company plans to put up VD/VOD, a continuous casting plant and a 400 cubic metre capacity PSA plant in order to reduce power consumption Commercial production of the company's new products namely, billets of mild steel, carbon construction steel, high/medium and low carbon wire rod steel, spring steel, industrial quality stainless steel and other grades of steel and stainless steel is expected to commence in November this year The company's issue which will consist of 25,00,000 equity shares of Rs 10 each at a premium of Rs 20 per share on rights basis in the ratio of five shares for every one held and 36,50,000 equity shares at the same premium for the Indian public will be lead managed by HMG Financial Services Company

Ludgate Pressman

A 50 50 joint venture promoted by the Ludgate Group of UK and Pressman Advertising and Marketing, Ludgate Pressman has commenced operations in the UK, US and India One of the UK's top specialist financial and corporate communications consultants, the Ludgate group is backed by CINVen, one of UK's leading venture capital organisations The group ranks among the fastest growing financial communications consultants in the UK registering a growth of 85 per cent last year and achieving an income of over six million pound sterling The other promoter, namely, Pressman Advertising and Marketing ranks as India's leading financial advertising agency and is associated with a total of Rs 33 5 billion raised through public issues, accounting for nearly 27 per cent of the total amount raised through such issues in 1993-94, in addition to being associated with rights issues involving Rs 20 6 billion Ludgate Pressman plans to provide corporate and financial communications, advertising and PR services to Indian companies in the international marketplace as also to international companies in India Ludgate Pressman also offers marketing programmes in GDR issues by Indian companies in addition to working closely with the merchant bankers, with the objective of stimulating investment interest for the GDRs from each market Further, all international media, press and analyst activities will be co-ordinated from the company's offices at London and New York and the company will offer investor relations programmes which involve establishment of a data base monitoring institutional contacts and covering all major shareholders and potential or target institutions

TTK Prestige

A TTK group company, TTK Prestige is diversifying and expanding its range of kitchenware After pioneering pressure cookers in the country, the company now plans to manufacture non-stick cookware, kitchen weighing scales, cast aluminium ware and kitchen implements For the first time in India, the company will manufacture the silver stone coated range of deluxe non-stick cookware and a premium range of Teflon coated non stick cookware under licensing from Du Pont, USA In addition to setting up a plant equipped with the latest facilities at Hosur for the manu facture of 'tawas' saute pans, sauce pans and frying pans the company is also modernising its existing facilities To part finance these projects the company is entering the capital market with a public issue of equity shares which will be offered at a premium of Rs 80 per share towards the end of September

Moti Electric Industries

An existing company engaged in the manufacture of different specifications of pvc cables, XLPE cables and aluminium alloy conductors which are used mainly by the state electricity boards, railways, mining industry, etc, Moti Electric Industries has now undertaken an expansion project envisaging increasing its manufacturing capacities at a total outlay of Rs 4 9 crore The project is to be funded through a public issue of 22,00,000 equity shares of Rs 10 each at a premium of Rs 10 per share The issue, which will open for subscription in the 2nd/3rd week of September, will be lead managed by Gaurav Capital and Financial Services and PNB Capital Markets

Mark Omega Organic

Mark Omega Organic Industries which is engaged in the manufacture of benzaldehyde (an intermediate which is used by drugs perumery, dyes and pesticides industries), benzyl alcohol (used in photography as well as in solvent and perfumery and pharmaceutical industries), benzoic acid (used as a preservative) and hydrochloric acid (used in general chemicals), is entering the capital market on September 1 with a public issue of 56,30,000 equity shares of Rs 10 each at par The company proposes to expand its existing facilities by adding facilities for the manufacture of 700 mt of benzaldehyde, 800 mt of benzyl alcohol, 60 mt of benzoic acid and 3 000 mt of hydrochloric acid The plant, which is within 150 kms radius of the industrial cities of Bombay, Poona, Mahad Chiplun and Nava Sheva Port, has easy access for procurement of raw materials and transportation of finished goods to industrial consumers and will enjoy backward area benefits The project which is being set up at a total cost of Rs 7 9 crore is expected to commence commercial production by October this year and is to be part financed through a public issue which will be lead managed by Union Bank of India

Adithya Aquaculture

Adithya Aquaculture, an Adithya group company, is setting up a grow out farm and a shrimp hatchery with an annual installed capacity of 100 million seeds at Eeduru village in the Nellore district of Andhra Pradesh Technical know-how is being acquired from Asian Aquaculture Corporation of the Philippines which is also investing $ 50,000 in the equity of the project and will provide technicians from the Philippines for the running of the shrimp farm and hatchery The first harvests are expected in December this year and the company plans to market its products through another company of the Adithya group, namely, Adithya Exports which is also investing Rs 30 lakh in the company's equity capital To part finance its project the company is entering the capital market on August 31 with a public issue of 34,14,000 equity shares of Rs 10 each at par

CURRENT STATISTICS

***EPW* Research Foundation**

A vigorous south-west monsoon so far notwithstanding, price expectations in respect of 'food articles' remain buoyant; a rise of 3.7 per cent in the group's price index over the past month and of 13.4 per cent in the fiscal year so far stands out. This is also reflected in the sharp rise in the three cost of living indices. All this is happening at a time when stocks of foodgrains with government agencies have reached a record level of 31.89 million tonnes. Simultaneously, offtake of foodgrains from the public distribution system has been declining. The current fiscal year so far has seen a marked sluggishness in the output of agriculture-based industries. Monetary expansion continues to be high; so also the addition to foreign exchange reserves which have crossed $ 17.7 billion.

HINDALCO

Diversification Plan

BELONGING to the Aditya Birla Group, Hindalco has further improved its performance in 1993 94 Despite the depressed economic conditions in the domestic and foreign markets the company managed to achieve a 6 8 per cent rise in operating profit and a 14 5 per cent rise in net profit, albeit on marginally lower net sales The company's operating profit margin improved from 30 8 per cent in 1991 92 to 38 9 per cent in 1993 94 while its net profit margin stands at 17 6 per cent (up from 13 5 per cent in 1991-92)

Though production of aluminium during the year fell from 1 63,485 mt in the previous year to 1 55 761 mt, that of alumina rose to 3,15 723 mt as against 3,05,300 mt produced in 1992 93 Rolled products produced were also higher at 30,740 mt as against 29,619 mt and the new cold rolling mill was commissioned during the year The mill is expected to enable production of a broad range of more specialised, high technology and high value products thus resulting in higher margins as also the ability to tap new domestic and export markets Production of extrusions also improved from 9,799 mt to 9 807 mt The Renusagar power plant meanwhile generated 2 665 million units of electricity as compared to 2 740 million units in the previous year despite the partial shutdown during the early part of the year and power output during the second half of 1993 94 touched an all time high A high degree of market orientation and a stable long term relationship with its customers has helped the company to reduce inventory levels to a mere six days production Though exports fell due to the subdued international markets during 1993 94 the company received two prestigious awards instituted by CAPEXIL and EEPC for outstanding achievements in exports for 1992 93 (when exports more than trebled) and with effect from April 1 1993 the company's exporting status was upgraded to that of a trading house

Meanwhile, encouraged by the response to its first $ 72 million GDR issue in July 1993 the company recently made another GDR issue aggregating $ 100 million in July 1994 The second issue was made to part finance the company's modernisation, expansion and diversification plans It is currently implementing an expansion project to increase its semi-fabricated products (smelting) capacity by 40,000 tpa taking total capacity to 2,10,000 tpa Further, in addition to the expansion of the alumina production capacity during the year from 3,00,000 tpa to 3,50,000 tpa, the company is again undertaking expansion to a level of 4,50,000 tpa in order to ensure that alumina production keeps pace with the proposed increase in smelting capacity In order to meet the increased requirements of power following the hike in smelting and alumina capacities the company is setting up two power generating units having a total capacity of about 150 mw at its Renusagar power plant Moreover, to improve its product quality and mix the company is undertaking a comprehensive upgradation of the existing hot and cold mills and extrusion facilities It is also installing a vertical ingot and billet casting facility in order to provide feedstock of the required quality for the rolling mills and extrusion presses

Its diversification plan envisages undertaking down-stream high value added products such as aluminium foil for which a 5,000 tpa plant is to be set up

KALYANI STEELS

Seamless Pipe Project

Kalyani Steels, which is engaged in the production of mild steel/carbon/alloy steel ingots/billets seamless pipes (carbon/alloy) castings (iron and aluminium) and chemicals, achieved an 84 6 per cent rise in operating profit in 1993 94 on a 5 4 per cent rise in net sales The sharp rise in operating profit, however, was nullified by the steep rise in interest charges (up 50 per cent) and depreciation provision (up 82 per cent) leading to a mere 3 8 per cent rise in net profit During the year production of mild steel/carbon/alloy steel ingots/billets was higher at 61,714 mt as against 58 886 mt produced in the previous year while sale improved from 55 113 mt to 59 982 mt over the same period Further, imported raw material consumed by the company was down to 34 per cent from 46 per cent last year

The company's seamless pipe project at Baramati has meanwhile almost been completed and is soon expected to commence commercial production Construction of the factory building and installation of hot and cold mills have been completed and trial production of hot finished tubes as well as cold pilgered tubes and cold drawn tubes has started Response to the company's products has also been reported to be good

Meanwhile the warrants issued by the company along with the non-convertible debentures issued in September 1992 were converted into 10,27,164 equity shares in November 1993 Further, to finance the cost of capital expenditure on modernisation and rationalisation of its steel plant, normal capital expenditure, investment proposals and funding long-term working capital requirements, the company offered 90,85,000 equity shares at a premium of Rs 50 per share on rights basis thus leading to a rise in equity capital to Rs 23 97 crore (after allotment in April 1994)

RALLIS INDIA

Higher Profit

Rallis India, after shedding its engineering interests in 1991 92, has made a comeback by notching profits in the following two years as against a net loss in 1991-92 The company s net sales during 1993 94 increased by 24 8 per cent over the previous year while operating profit rose by 10 8 per cent over the same period Despite turnover and capital expenditure being higher over the previous year there was a lower rise in interest charges due to tight control on working capital and a judicious mix of commercial paper, dollar denominated export credit, soft line credit from financial institutions and the general fall in lending rates This helped the company post a 18 6 per cent higher net profit over the previous year Encouraged by its performance the company raised its dividend rate from 40 per cent last year to 45 per cent

Despite adverse climatic conditions the company s agrochemicals division further consolidated its leading position in the market It commissioned additional capacities for pesticides during the year and also diversified its product range thus enabling it to re-enter several international markets Sale of solid pesticides during the year rose from 11,847 mt in the previous year to 15,037 mt while that of liquid pesticides fell from 6,392 kl ltrs to 5,627 kl ltrs, entailing a sale realisation of Rs 1 66 crore as against a turnover of Rs 1 57 crore in the previous period The fertiliser division's activity grew yielding higher turnover and profits This was made possible by the decontrol of phosphatic and potassic fertilisers which enabled the company to import substantial amounts of fertiliser and market them along with indigenous nitrogenous and complex fertilisers Production of mixed fertilisers during the year was higher at 5,499 mt as against 1,066 mt produced last year and sale rose from 1,95,182 mt to 3,97,369 mt (including that purchased for resale) The

pharmaceutical division of the company, which undertook a major re-structuring, achieved a turnaround during the year. Though this was achieved through reduction in inventories at the cost of sales (sale of tablets and capsules was lower at 6,803 lakh nos as against 7,081 lakh nos sold last year), profitability improved, thus paving the way for further drastic action to ensure long-term viability. The fine chemicals division maintained sale of imported materials while improving its gelatine operations. The company has undertaken an expansion programme for increasing the gelatine facility's capacity by 60 per cent in order to meet the rising domestic demand and to enter the export markets. Further progress has been made on the vegetable tanning project which is based on indigenous technology sponsored by the company at the Central Leather Institute. The results of the test-market of the vegetable tanning extract, an environment-friendly product, have reportedly been encouraging.

On the export front, the company achieved a 11 per cent rise in exports despite recessionary trends in Europe and Japan which are its major markets. It expects higher exports in the coming years as prospects in the new export markets for garments and marine products, which the company recently entered, are bright.

Meanwhile with a view to entering the real estate development business, Rallis India plans to renovate and develop several underutilised properties of its own in the metro cities in order to convert them into performing assets.

GERMAN REMEDIES

New Products

After a dismal performance in 1992-93, German Remedies (GR) has managed to significantly improve its performance in 1993-94. While net sales increased by 13.7 per cent over the previous year, operating profit was up 88.4 per cent and net profit was almost seven times higher than in the previous year. Consequently the company's operating profit margin which languished at 10.7 per cent in the last two years, i e, 1991-92 and 1992-93, spurted to 17.8 per cent and net profit which stood at around 1 per cent zoomed up to 6.8 per cent. Following the sharp rise in profitability the company has increased the dividend rate from a mere 5 per cent last year to 16 per cent in 1993-94.

Production of tablets and capsules, liquids (orals and injectibles) and chemicals was higher during the year. The import content of raw material consumed has been brought down from 53.9 per cent to 50.7 per cent. The company claims that its improved preformance was due to improvement in product sales mix, and tighter control exercised on revenue and capital expenditure as also the strengthening of marketing activities through the complete reorganisation of sales and marketing setup. Exports, however, suffered due to the absence of major exports to CIS.

During 1993-94, 10,83,027 15 per cent secured redeemable partly convertible debentures of Rs 100 each, which were issued in the previous year on rights basis, were partly converted into 10,83,027 equity shares of Rs 10 each at a premium of Rs 45 per share on December 1, 1993. Further the company also issued 6,34,866 equity shares of Rs 10 each at a premium of Rs 45 each to its foreign collaborators in order to enable the latter to maintain their shareholding stake. Following the issue of equity, the company's capital base has risen from Rs 6.5 crore to Rs 8.2 crore.

Meanwhile the company's new antibiotics plant at Goa commenced commercial production and will contribute to the 1994-95 turnover. GR plans to continue launching new products in the domestic market and in line with this strategy it has commenced marketing several oncology products of Asta Medica AG in the domestic market since November 1993 besides producing and marketing new products like the JONAC range of anti-inflammatory drugs and various generic products.

INDIAN ORGANIC

Back in Black

Indian Organic Chemicals (IOC) has managed to come back into the black after posting a net loss of Rs 8.7 crore in 1992-93. While the company's net sales rose by 23.4 per cent in 1993-94, operating profit rose by 37.3 per cent. Sale of its properties/poly condensation unit yielding a net profit of around Rs 29 crore which further enhanced profitability during the year. Higher profitability (even after deducting a net non-operating profit of Rs 25.4 crore for the year, net profit stands at Rs 2.1 crore) enabled the company to declare a dividend of 12 per cent during the year on a higher equity base after skipping dividend last year.

Production and sale of alcohol-based chemicals during 1993-94 was lower at the chemicals division following severe competition in the market. Further, a sharp rise in the price of basic raw material, namely, industrial alcohol and a drop in sale prices due to competition from exports put pressure on the division's margins. Consequently, production and sale of these chemicals fell from 15,540 mt and 15,147 mt, respectively, to 14,603 mt and 14,300 mt. The company's 'Futura' synthetics division saw an improved performance with production and sale of polyester chips improving from 10,598 mt and 11,273 mt, respectively, to 14,433 mt and 13,682 mt during the year under review. Production and sale of polyester filament/partially oriented yarn however could not be improved over the previous year's level mainly due to the strike in the plant from November 1992 to May 1993, the two transport strikes during August and September 1993 and the texturisers' strike in March this year. The 'Sonata' software division, which was appointed by Microsoft Corporation as its distributors in India for its entire range of products, meanwhile maintained its leadership position in the market and offered additional value added products such as high resolution fonts, colour separation software, document management solution, etc, to the printing and publishing industry in addition to 'Prakashak'.

The chemicals division of the company received the ISO 9002 accreditation thus making the company the first heavy organic chemical manufacturing unit in the country to do so. The modifications to the phenylglycine plant, based on the limited foreign technology acquired, was expected to be completed in July this year and commercial production was expected to commence soon after. The division is now marketing pesticides formulations and other agro products like bio-fertilisers and 'jalshakti' and this is expected to contribute substantially to the current year's sales. The synthetics division also completed revamping of its spinning line to maximise spinning capacity and has established facilities for solid state polymerisation with foreign technical know-how. Further, Futura Polymers, the company's 100 per cent EOU joint venture project set up with Pepsi-Cola International of the US commenced exports in April this year. The project, which has been set up with a contribution of Rs 18.7 crore from IOC alone, is expected to produce 24,000 mtpa of bottle grade polymer chips at its full capacity which will be attained before the end of the calendar year. The company's foreign currency loans will fall by about Rs 12.7 crore after it received approval from financial institutions for sale of equipment and machinery constituting its POY plant. The software division commenced marketing operations in the US through Offshore Digital Service Inc, and it has established a long-term contract with an existing client following the improved volume of business for software projects in Europe.

Food Exports and Food Requirement

J M

The intention of the minister of agriculture, and indeed of the government in general, to focus on increasing crop exports, including exports of foodgrain, involves operating with a disregard for the likely decline in food availability for the poorest and the most vulnerable groups in the population.

ON a number of occasions in recent times, the union minister for agriculture, Balram Jhakar, has declared bright prospects of foodgrain exports from India and dismissed fears of any consequent food shortage at home. For example, according to the *Financial Express* of July 5, he is reported to have told a PTI interview that "he was confident the country could export foodgrain to earn foreign exchange and did not agree with the view in some quarters that India needed to produce 230 millions of foodgrain by the end of the century to feed its own population". According to him "the current production of 180 plus million tonnes is sufficient for even the projected population of one billion by 2000 AD" and that "the estimate of 230 million tonnes was based on a presumed pattern which did not take account of the varied consumption culture which included meat, nuts, pulses, etc".

What is most striking about such statements is not so much their Marie Antoinette-like quality, as much as the break they represent from the pronouncements of Jakhar's predecessors. The latter, if anything, usually over-estimated future requirements in order to justify higher outlays for agriculture. And the differences here testifies to a subtle change in the nature of ministerial responses, probably flowing from the altered incentive structure under the new economic regime.

Evidently, the message has been driven home in ministries as diverse as power, telecommunications, drugs and pharmaceuticals, coal, petroleum and chemicals, etc, that large increases in the capital expenditure under departmental control are no longer possible. Therefore, the pecuniary benefits (to those involved in decision-making) that could hitherto be derived from such expenditures have to be obtained by other means. There is a clear method emerging in the alarcity with which minister after minister is jumping in to welcome foreign investment, even while they all simultaneously guard their turf by insisting that *they* conduct the negotiations and make the necessary concessions. As in the 'bad old days', when ideology had little to do with the jockeying for plan funds, the new-found love for attracting private capital has less to do with any ideological shift and is more a means of achieving the old objective of parallel private enrichment under an altered set of constraints.

The main criticism of the old regime was that the so-called 'soft budget constraint' allowed expenditures to mount well beyond levels justified by current taxes and future project returns, thus enabling costs to be padded for both populist reasons and for private gain. Today private investment, supposedly more efficient, is being wooed essentially because public funds are scarce and because, with enough discretion retained, this allows government decision-makers to serve their earlier goals (on both the public and private agenda) in a situation of a supposedly 'hard budget constraint'. It is almost certain that the resulting discretionary tax concessions and sovereign guarantees which are being offered in the name of attracting private investment have even worse implications, both fiscal and economic, than those of the earlier regime. Rent seeking continues, but at a greater economic cost, especially because per force decision-makers now have no real option but to seek their private returns upfront. And because in today's environment such concessions are easier to grant to foreign investment proposals, these are more attractive than domestic private investment.

In this context, ministries such as Balram Jakhar's are at a disadvantage compared to those presiding over sectors where mega-projects are on offer from large corporations based in recession-ridden developed countries. True, there is scope for foreign investment in areas like horticulture, aquaculture and food processing, but such investment really requires concessions not from the centre but from the states, and in pushing for these the ministry of agriculture cannot realistically be accused of chasing any private agenda.

On the other hand, with almost all commentators agreeing that 'reforms' so far have bypassed agriculture, this ministry, probably more than any other, stands accused of having done precious little for its sector. Moreover, the fiscal strategy of cutting subsidies on fertiliser, power and irrigation, although still in a state of limbo, has antagonised farmers. Despite the aggressively positive propaganda on the part of officially-controlled media, rural folk continue to be uneasy about the possible implications of GATT. In this rather difficult situation, two possibilities were open to shape a concrete response.

The first option would involve a massive decentralisation of funds available for agriculture and rural development along with a renewed emphasis on land reforms The principal argument in favour of this strategy is that this would almost certainly result in a better return to public funds expended. Also, in such a scenario, units of local self-government could be devolved funds, including those currently going into explicit and implicit subsidies, while increasing user costs to economic levels. This would confront communities with truer costs and benefits of different options and, although subsidies could still continue if the local authority so chose to spend devolved funds, the chances are that waste would be reduced and new more economically beneficial opportunities would be identified. However, this would seriously weaken the patronage linkages underlying the present political system. For the party currently in power, this would also carry the danger that a rural populace that is already less than enthusiastic about the present economic and political arrangements, might with relative economic independence destabilise the present order. For this reason alone, this option stood no chance, as is already evident in the fact that almost every Congress-led state administration (with the honourable exception of Madhya Pradesh) is dragging its feet on the new panchayat legislation. Moreover, this runs contrary to current ideological predilections for at least two reasons: it would not reduce government expenditure on rural areas so that fiscal adjustment would require more taxation; and it would stress community rather than private effort while at the same time weakening the actual control of the 'reformers' at the centre.

The second option is the one more likely to be pursued in the present context, because it does not disturb the political status quo, retains the centralisation of economic and financial power inherent in this pattern of 'reform', and is also consistent with the reigning theology of emphasis on 'free' markets. This strategy involves the liberalisation of internal and—especially—external trade in agricultural commodities, in the expectation that rising output prices will act as incentive to farm investment and lead to increased growth rates of output, while simultaneously improving real incomes in the countryside. Enhanced agricultural exports play a critical role in this strategy,

and the assumption usually made is that such exports will come out of increasing aggregate production, so that both the issues of food security and distributional considerations arising from the shift in relative prices can be dealt with. The focus on agricultural exports is particularly attractive for the government given the recent data on exports which suggest that protectionism and recession in developed countries remain formidable obstacles to the substantial expansion of Indian manufactured exports.

This background explains the motivation behind the government's—and the agriculture ministry's—desire to establish that increased volumes of agricultural exports are not only likely to lead to greater rural and national prosperity, but will also involve no shortage of domestic per capita availability relative to requirement. Two issues are involved here: the expectation that price incentives will be adequate to ensure additional farm investment *and* output even in the context of declining expenditure on rural infrastructure; and the estimation of 'adequate' domestic foodgrain requirement which will allow the release of an exportable surplus. It is the latter which is currently being given greater weight in policy pronouncements. And, as has become the official custom, the basic policy thrust is reinforced by the report of a specially appointed committee, which provides arguments and empirical estimates which broadly support the desired conclusion. In this case, the relevant report is that of an inter-ministerial working group, with representation from the ministries of agriculture, food, civil supplies and health, and also from the Planning Commission, the National Sample Survey Organisation and the National Institute of Nutrition (hereafter working group), set up specifically to review domestic foodgrain requirements by the year 2000. One important conclusion in this report is that "total per capita availability of energy, proteins and fat from indigenous production now exceeds the nutritional requirements of the entire population".

Such a significant conclusion can neither be dismissed out of court nor accepted at face value, without a more detailed consideration of the definitions of nutritional requirement employed and the basis of the empirical estimates. Clearly, a statement in general terms is meaningless and has little value. In order to arrive at an appraisal of the present and likely future nutritional status of India's population, it is necessary first to define a 'requirement norm', then to obtain estimates of actual nutritional intake by different groups in the population, and finally to assess over time and across groups the extent to which the norm requirements are met through actual intake. In all of these exercises, there are problems not only in defining the nutritional norm but also in measuring the actual intake, given the multiplicity of data sources and differences in sampling procedures followed.

Nutrition: Requirements and Intake

The nutritional norm commonly employed in India is anchored upon the Recommended Daily Allowances (RDA) of the Indian Council of Medical Research (ICMR), which is an average requirement taking into account the age, sex and activity distribution of the Indian population and assuming the nutrition needs of normal, healthy individuals in each group. The normative daily calorie requirements on this basis are 2,400 kilo calories (KCal) for rural areas and 2,100 for urban areas, and this is also the norm used by Indian poverty studies and adopted by the WGFR. Such a norm is necessarily imprecise because actual requirements can vary considerably from individual to individual, but it is useful as a rough bench-mark when supplemented by demographic and clinical indicators on life expectancy, infant mortality, stunting, wasting, the body-mass index, etc.

There are diverse data sources for actual intake. These include the Food Balances (FB) derived from CSO data, which estimate net food availability in the country after adding up production, net imports (after exports) and known additions to stocks for any year. From this the per capita availability of different foodstuffs is calculated and the average calorie consumption in the country is obtained, using appropriate conversion factors. In contrast to this approach are the disaggregated, survey-based estimates of the NSS and the National Nutrition Monitoring Bureau (NNMB). The NSS surveys are based on large samples, covering all Indian states. The NNMB surveys, though covering smaller samples, are more intensive, and focus more directly on actual dietary intakes, compared to NSS calorie intake estimates which are obtained as part of a larger exercise to measure consumer expenditure patterns as a whole. The main difference between the FB and the survey estimates is that while the former can only give estimates of the national average intake, the latter, particularly the NSS, permit a disaggregation by different groups in the population.

The FB data, on which the working group has relied, suggest that average per capita daily energy availability remained roughly constant between the early 1960s and the mid-1970s, at between 2,000 and 2,100 KCal, with about 70 per cent of this coming from foodgrain. However, it grew steadily thereafter to around 2,400 KCal currently, with almost two-thirds of the increase being accounted for by foods other than foodgrain. On the other hand, as per NSS estimates, average energy intake in rural areas was 2,266 KCal in 1972, 2,383 KCal in 1977-78, 2,230 KCal in 1983 and 2,257 KCal in 1987-88; the corresponding figures for urban areas being 2,107, 2,382, 2,099 and 2,129 KCal. Thus, the NSS data show no clear trend over time, and are substantially larger than FB estimates for earlier years while being lower in the late 1980s. A similar pattern of marginal calorie decline, although with somewhat lower intake estimates, can be observed from the NNMB data. Thus, if data from the surveys are accepted there is no evidence of any significant improvement in average nutritional intake to warrant the working group's optimistic assessment derived from the FB data.

Some of the discrepancy can be accounted for by the nature of the survey data. The surveys of NSS and NNMB, made at the household level, exclude sections like migrant labourers, destitutes and the homeless. They tend therefore to under-enumerate the very poor, and, for the NSS such under-enumeration is known to exist also for the very rich. This matters because for foodgrain (which provides the bulk of average calorie intake in India) the difference in consumption between middle and upper income groups is small but consumption disparities are quite pronounced when it comes to the poorest sections of the population. To the extent that these poorest groups are under-enumerated, there is an element of overestimation of foodgrain consumption in the NSS surveys. Similarly, when it comes to items such as milk, eggs and sugar (which are the fastest growing food items according to FB) the difference between the poor and middle groups is relatively small compared to the disparity with the rich so that under-enumeration of the rich leads to an under-estimation of such consumption.

Such under-enumeration can explain the deviations between FB and survey estimates even if the former are generally valid. Thus, given the weight of foodgrain in overall consumption, the surveys would tend to overestimate calorie intake but this bias w0uld tend to be reversed as consumption of milk, etc, grows more rapidly, as indeed has occurred according to the FB data. Moreover, unlike the survey estimates, the FB estimates, which clearly indicate an improvement in the average nutritional status during the 1980s, are also consistent with the fact that most clinical indicators (including the proportion of underweight children and the Body Mass index for adults) suggest a definite improvement between 1975-79 and 1988-90 (*cf* NNMB *Nutritional Assessment and Analysis in India*). Thus, the working group may be right in preferring the FB intake averages to the survey-based ones.

What is debatable, however, is its implicit confidence that because the average nutritional intake according to FB data is larger than RDA norms, the nutritional situation overall is satisfactory. In fact, despite a reduction in the underweight prevalence

among children from 71 per cent in 1975-79 to 63 per cent in 1988-90. India had the second highest incidence of this clinical measure of malnutrition among all the countries surveyed in the recently published United Nations *Second Report on the World Nutrition Situation 1993* And special NSS tabulations prepared for the Expert Group on Estimation of Proportion and Number of Poor show that more than 60 per cent of Indians consumed less calories than the RDA norms in 1983 and 1987-88, a proportion which is double the official estimate of the incidence of poverty

NSS data provide a disaggregated picture of calorie consumption by different expenditure classes in both rural and urban India over time These figures can be assessed in unadjusted form, or adjusted by blowing up by common factors so as to give the same itemwise average intakes as given by FB The unadjusted NSS figures suggest a fall in calorie intake particularly for richer groups while adjusted data show some rise particularly for the poorer groups But the notable point here is that, especially for the bottom 80 per cent of the population the changes in either direction are small and no clear trend can be discerned One important fact which emerges however is that the average energy intake of the bottom 40 per cent of the population is considerably below the RDA norms of 2 400 KCal for rural areas and 2 100 KCal for urban areas, and only the top 20 per cent are unambiguously above these norms

The NNMB study quoted above has pointed out that the levelling off of cereals and calorie consumption is a cause of concern as current levels are too low to translate into nutritional adequacy' The virtual stagnation in calorie intakes among lower income sections comes despite the fact that poverty levels measured by total expenditure on food and non-food are falling This may have to do with the fact that the poor groups are now forced to divert a larger portion of their wages for buying items like fuel, which were once 'freely available from, say, common property resources

Demand for Foodgrain

Although the main task set for the working group (according to its terms of reference) was to "suggest realistic requirement of different food crops by 2000 AD", it restricted itself only to the determination of normative foodgrain requirements based on the energy-protein needs of the average population One weakness of such an approach—that nutritional adequacy norms derived from the population average can be highly misleading as a bench-mark for the nutritional status of the population at risk when there are large inequalities in food consumption—has already been commented upon Another deficiency, which is perhaps more important from the point of view of policy, is that such projections of normative requirements can hardly claim to represent 'realistic requirements' for the future, especially given that actual foodgrain consumption has exceeded these stated 'norms' in all except seven out of the last 40 years

The basic problem is that actual consumer demand is driven, not by nutritional norms, but by tastes, incomes and prices As a result, some people can fall below the norm because they cannot afford the basket of foods defining the norm, others, who can afford the norm basket, may still consume below the norm because at prevailing prices their tastes lead them to choose nutritionally inadequate diets, and yet others may have tastes which lead them to consume amounts of food grossly in excess of their nutritional requirements In general, the actual demand for foodgrain in any country is unlikely to be determined either entirely or even primarily, by nutritional requirements Countries which can enforce strict food rationing based on dietary requirements and availability may come close to limiting actual demand to nutritional needs as many countries did indeed manage during World War II, but in a free market economy 'normative requirements of the type calculated by the working group are extremely poor indicators of actual market demand

The most important policy implication of this is that if supplies are limited to the calculated normative requirements' but households are left to choose their consumption freely in the market, the likely excess of actual demand over the normatively determined supply would push up food prices and squeeze the consumption of those groups least able to protect their food consumption in the face of food price inflation Acute distress is possible even if the total availability of food is adequate to meet average norms of nutritional requirement if the poor lose entitlements' as a result of incomes failing to adjust to food prices

Thus, the 'normative requirements projected by the working group are valid as an indication of likely demand only on the explicit assumption that the excess consumption of the rich can and will be held back and diverted to the poor through effective rationing Such a view, that foodgrain production would be enough to meet domestic requirements if only it were distributed properly, is one which was articulated by certain economists during earlier periods when India had to meet food shortages through imports The report echoes this position when it notes that "undernutrition is essentially a problem of inadequate access of the poor to food and not that of inadequacy of indigenous production" However, the point is that the steps required to set in place a comprehensive rationing scheme effective enough to ensure adequate access of the poor and underprivileged groups were found to be both infeasible and undesirable even in those earlier times of acute shortage It is certainly highly unlikely that they would be considered seriously today Indeed, despite the observation quoted above the working group's essential concern is that "foodgrain production will remain stagnant at current level if a strong market pull is not exercised", and it sees exports as the way out

The question then is what is the likely difference between domestic production and consumption, given plausible increases in national income and assumptions about domestic prices which are both realistic and politically feasible? The methodology employed by the working group is singularly inappropriate to answer this question The appropriate methodology, used by most economists for projecting future demand, is to first model the past demand as a function of incomes and prices and then to use this model to project future demand on the basis of assumptions regarding likely trends in incomes and prices A key parameter in such exercises is the income elasticity of demand, which is the percentage increase in per capita demand likely to be associated with every 1 per cent increase in per capita income There are a number of studies which have attempted to estimate India's foodgrain demand, and these show a fairly surprising degree of consensus in placing this elasticity at around 0 4 What this means is that if population continues to grow at 2 per cent per annum, per capita GDP growth is restored to the 3 per cent per annum achieved in the 80s, and if relative prices remain unchanged, the demand for foodgrain would grow at 3 2 per cent per annum Using the same bench-mark figures as used by the working group as base, this yields a demand in year 2000 of 219 million tonnes at physiological level, or 225 million tonnes at production level This is much lower than some other projections (of up to 263 million tonnes made recently in G S Bhalla (ed), *Economic Liberalisation and Indian Agriculture* 1994) but considerably larger than the working group's projection of the requirement (at production level) of only 179 million tonnes in year 2000

One important implication of this concerns the likely surplus available for export The working group estimates of foodgrain requirements suggest that there is already a surplus over production of almost 20 million tonnes and this will increase over time if production increases faster than population On the other hand, the demand projection based on an income elasticity of 0 4 implies that there will be no exportable surplus, and indeed a deficit of around 3 million tonnes, in 2000 AD even assuming that foodgrain production grows at the high 1980-90 rate of 3 per cent per annum

It might, however, be argued that no particular sanctity attaches to the value of 0.4 for the income elasticity which is based on rather old research, and that changes in tastes and prices are likely to cause foodgrain demand to grow somewhat slower in the future. Indeed, the World Bank has also recommended diversification of agricultural production and opening up of agriculture to international trade while projecting foodgrain demand in year 2000 to be 205 million tonnes (*1991 Country Economic Memorandum, Volume II*). This estimate, which is about half-way between that of the working group and that obtained using an income elasticity of 0.4, implies an exportable surplus of around 17 million tonnes if foodgrain production continues along past trends. It was obtained on the basis of an assumed growth of GDP of 4 per cent per annum and an implicit income elasticity of only about 0.2. This lower elasticity assumption is based on the research of R Radhakrishna of Centre for Economic and Social Studies, Hyderabad who using National Sample Survey (NSS) data has found that changes in foodgrain demand over time are not captured adequately by prices and incomes alone but must incorporate shifts in tastes away from foodgrain.

It has already been noted above that in some ways the FB data fits better with other known facts. Moreover, the adjusted NSS cereal consumption figures give a picture where over time per capita cereal consumption has been rising for the poor groups and remaining constant for the rich—a pattern quite consistent with the cross-section relationship. Regressing these adjusted NSS figures against per capita GDP and relative prices gives income elasticities ranging from 0.6 for the poorest 40 per cent of the rural population to zero for the richest 20 per cent in rural areas, with urban groups having intermediate values ranging from 0.5 to 0.15. The weighted average elasticity for the entire population works out to 0.35 which is also the value obtained when the elasticity is calculated directly from per capita FB figures and GDP data for the period 1980-93. Using this elasticity along with the assumption of a 3 per cent growth of per capita incomes gives a foodgrain demand of 222 million tonnes in year 2000.

This calculation suggests that the nation would be just about self-sufficient (without any sizeable export surplus) if foodgrain output grows at 3 per cent per annum and food prices are not allowed to rise faster than the average price level. Further calculations using the decile specific elasticities to project the distribution of this average consumption shows that even though the poor would be the main consumers of additional production, the bottom 40 per cent of the population would continue to have calorie consumption a 10 to 15 per cent below the required nutritional norms. In other words, unlike the working group on foodgrain requirement which projects high exportable surpluses of foodgrain with adequate nutrition for the domestic population, the likely picture in year 2000 is one where undernutrition would continue to afflict roughly half the population and yet there may not be much by way of an exportable surplus.

However, export surpluses can be squeezed out if domestic food prices are allowed to rise much faster than the average level, as is happening now. It is by now clear that the government plans to liberalise international trade in foodgrain allowing domestic prices to reach international levels. Currently, Indian prices are roughly 10 per cent less than international prices for wheat, 30 per cent less for rice and about 10 per cent more for coarse cereals and pulses. Moreover, the recently concluded GATT agreement is likely to push up the international relative price of wheat and coarse grains by about 5 per cent while bringing down rice prices by a similar amount (A S Brandao and W Martin, *Implications of Agricultural Trade Liberalisation for Developing Countries*, World Bank, 1993). In the net, therefore, liberalisation of agricultural trade in the post-GATT scenario may involve a rise in the domestic relative prices of foodgrain by about 15 to 20 per cent. The effect of such a price rise (as measured by calculated price elasticities or the percentage decline in food consumption per percentage increase in relative price) would be to squeeze the consumption of the poor while leaving that of the rich relatively unaffected. In this case, export surpluses of about 10 to 15 million tonnes may be possible in 2000 AD but at the cost of the poor consuming significantly less than even the inadequate amounts they do today. It should be noted that while the effect of exporting food upon domestic price and availability is direct and therefore more obvious, similar results would occur even if other non-food cash crop exports were encouraged, insofar as these imply acreage shifts away from food rather than substantially increasing total supply.

It therefore appears that the stated desire of the minister of agriculture, and indeed of this government in general, to focus upon increasing crop exports—including the exports of foodgrain—involves operating with a disregard for the likely decline in food availability for the poorest and most vulnerable groups in the population. But in its emphasis on price incentives and generally deregulated markets—as indeed, in the lack of concern for the impact upon poorer groups—this strategy is consistent with the other elements of the economic 'reform' package of the present government.

UN Human Rights Rapporteurs Censure India

A G Noorani

The reports of the two Special Rapporteurs of the UN's Economic and Social Council on 'extra-judicial executions' and on 'torture and other inhuman treatment' as well as Amnesty International's report on 'disappearances' present exposures of outrages perpetrated by the Indian security forces. Here is ample material for the National Human Rights Commission to work on, if it is serious about its mandate.

SPOKESMEN of the government of India have been eloquent about India's transparency on the human rights situation. It has not appeared in our press, but the government turned down a request by the Special Rapporteur on 'extra-judicial, summary and arbitrary executions', Bacr Waly Ndiaye, appointed by the UN's Economic and Social Council, to visit India. The Rapporteur's Report dated December 7, 1993 is the eleventh since the Council established the mandate on May 7, 1982. Paras 327 to 342 of the report concern India.

Ndiaye wrote (para 334): "In the light of these allegations and, in particular, of the fact that similar reports had come before the Special Rapporteur over a number of years, the Special Rapporteur conveyed to the government of India his interest in carrying out a visit to that country with a view to being in a better position to evaluate the situation and, consequently, proposing constructive recommendations that may help prevent the recurrence of such violations. With reference to the particular problem of deaths in custody due to ill-treatment, it was suggested that such a visit could be carried out jointly with the Special Rapporteur on the question of torture."

What was the response? Para 339 records: "The Special Rapporteur was informed by the government of India that it was preferable to let the newly established human rights mechanism deal with allegations of violations of the right to life." As has been noted earlier (*EPW*, August 6, 1994, 'Kashmir and a Farcical Human Rights Commission') the HRC headed by Justice Ranganath Misra is a farce when it deals with Kashmir, no doubt for 'patriotic' reasons. It has yet to do justice to its mandate in respect of Punjab. We shall watch its performance. Insofar as it has bestirred itself on TADA, it deserves praise. The HRC bids fair to be a critic within the framework of 'the national consensus' as ordained by the Establishment—do 'good' on TADA and thus acquire 'credibility' to support the government on Kashmir.

The Special Rapporteur recorded his disappointment in the concluding para (392) in these telling terms: "The Special Rapporteur remains concerned at allegations of violations of the right to life *that continue before him*. He will continue to monitor the situation closely. As concerns the possibility of a visit to India, the Special Rapporteur informed the representatives of the government of India that he did not intend to carry out tasks which fall within the competence and responsibility of national institutions charged with the investigation of human rights violations but *to seek first-hand information* which would provide him with a better understanding of the situation and the problems faced by the authorities with respect to the right to life" (emphasis added). Tersely put, the government of India did not want an independent international official to acquire 'first-hand information' about its record on the right to life. In fact a joint visit by two Special Rapporteurs was requested and refused, but not a word of it in the press.

India's record is a none too flattering one, as Ndiaye noted (para 327): "Since the middle of 1992, the number of deaths in police and military custody have reportedly risen sharply. In many cases, the detainees were reported to have died after torture, shortly after their arrest. As in past years, torture was said to be widespread throughout India to extract confessions or information. Allegedly the victims even included policemen. The Special Rapporteur was informed that, in March 1993, the occurrence of killings of detainees had been admitted by a senior Kashmiri official."

The Special Rapporteur on 'Torture and other cruel, inhuman or degrading treatment or punishment', Nigel S Rodley, gave his report for the year 1993 on January 9, 1994. Paras 261 to 316 of the report deal with India. Para 262 reads: "Information was also received according to which rape by the police is common throughout the country. The victims are generally poor women and those from vulnerable low-caste and minority groups who are taken into custody as suspects, or as hostages for relatives wanted in criminal or political cases or in order to extort payment to secure their release."

Predictably, in Kashmir the outrage has been perpetrated with impunity: "a pattern of human rights violations committed by members of the security forces in the course of their operations in Jammu and Kashmir. These include reports of brutal torture and rape by members of security forces, often in retaliation for attacks by Kashmiri militant groups on them... It was further reported that *the use of rape is common in Kashmir as a weapon against women suspected of being sympathetic to or related to alleged militants*... The authorities have rarely investigated charges of rape by security forces and those which were investigated did not result in criminal prosecutions" (emphasis added).

Finally, there is a report dated December 22, 1993 by the Working Group on Enforced or Involuntary Disappearances. Its previous four reports covered India as does the latest one. Of a total of 213 cases transmitted by the working group to the government, the latter sent 'specific responses' only on 66 and 'clarified' 19 others, that is 85 cases out of 213. Apparently New Delhi did not respond at all in respect of the other 128 cases. Of the 19 cases 'clarified', the bodies of 13 were identified. The others were identified as persons in prison (3), released (2) and at liberty (1).

Against this background, the report of Amnesty International published on December 15, 1993 on the same subject acquires added relevance. It is entitled 'An Unnatural Fate: 'Disappearances' and Impunity in the Indian States of Jammu and Kashmir and Punjab'. It specifies as many as 208 cases in its appendices, but not one specific inaccuracy has been pointed out by the government of India whose response has been a sweeping denial. It should be mentioned that the report also discusses *in detail* "human rights abuses perpetrated by armed opposition groups" and 'condemns' them. It is a meticulously documented exposure of outrages perpetrated by the security forces in the two sensitive states. Will the National Human Rights Commission take up those cases with the respective state governments. Here is ample material for it to work on.

NEW DELHI

A Government Running Out of Options

B M

The prime minister's August 15 speech, with its sabre-rattling directed at Pakistan and its cataloguing of populist schemes which nobody takes seriously any more, was a clear expression of how this government and its economic reform programme are nearing the end of their tether.

UNLIKE the statesman-like address of the head of the state, president S D Sharma, on the eve of Independence Day, the speech of Narasimha Rao, the prime minister, on August 15 from the ramparts of the Red Fort to a captive audience was that of a politician burdened by the uncertainties of the coming elections to 10 state assemblies and eventually to the Lok Sabha early in 1996. He could be seen to be not riding the high horse and pretending to be unassailable as he did at the Congress rally a few weeks earlier staged to celebrate three years of the government headed by him. He was, on the contrary, very much on the defensive in his speech on August 15. During the intervening weeks between the Congress rally and Independence Day, he was put squarely in the dock by all the opposition parties uniting on the issue of growing corruption and the accountability of the government when a wishy-washy 'Action Taken Report' was presented to parliament on the securities scam. The president, significantly, had found it necessary to urge all political parties and the government to observe the principle of accountability to the people of India which had become an issue of vital national concern because of the deadlock in parliament over the government's attempt to sidetrack its responsibility for the gigantic fraud perpetrated with the involvement, directly or indirectly, of government officials and ministers. The prime minister simply skirted this major issue.

How far the president's public advice influenced the government's decision later to agree to revise its Action Taken Report is difficult to guess. The prime minister had not given any hint of flexibility on the united demand of the opposition parties, in spite of their many differences, for the withdrawal of the government's ATR. It is, however, tempting to think that the government was forced, in the face of the firm stand of the opposition parties, dissent within the ruling party and the sage advice of the president to give up its rigid stand and make possible the return of parliament to normal functioning.

The prime minister on August 15 also chose to go for what can only be characterised as a long chauvinistic tirade against Pakistan. What exactly inspired him to do that too is difficult to guess. But the moral force of India's position on relations with its immediate neighbour was certainly undermined when he tried to match the jingoistic position of Pakistan and talked of recovering for India what is called 'Pakistan occupied Kashmir'. When this was combined with emphatic promises of increasing the military power of India, the reputation of India as a peaceful, democratic country seeking friendship with its neighbours was hardly enhanced. It was certainly not in the spirit of the Simla accord which has for long been the basic frame of India's policy towards Pakistan. The determination to hold on to Kashmir with military means and at all costs, which Rao articulated, cannot give solace to the people of Kashmir who are engaged in a bitter struggle for their autonomy and democratic rights. The prime minister's announcement of preparations for holding elections in Kashmir was indeed provocative for the Kashmiris in their prevailing circumstances. The idea that Narasimha Rao can pull off a repeat of the elections in Punjab to restore peace and order in Kashmir should not be taken seriously and, in the absence of a genuinely democratic approach to the people of Kashmir, can actually aggravate India's Kashmir problem.

The second part of the prime minister's speech was a listless presentation of a catalogue of some populist measures which, after the experience of what little official schemes launched in the past to generate employment, etc, have actually delivered, no longer carry conviction. The performance of the government on this score in the last three years has been dismal. Rao indulged in a lot of rhetoric, for instance, on eliminating child labour. But it is well known that child labour has been attempted to be covered up rather than ended because of the government's social and economic priorities, especially its focus on promoting exports with cheap labour. Mere reaffirmation of populist intentions and schemes by the government cannot any longer be expected to yield political-electoral dividends. Combined with government's inefficiencies, populist promises actually acquire a grotesque aspect. Thus Narasimha Rao had to admit that the corporate fund of Rs 500 crore for the benefit of minorities which had been announced by him on August 15 last year could not be set up so far because of legal hurdles. The sentiments of minorities, in particular the large Muslim minority in the country, can hardly be assuaged by such measures when they find themselves the objects of gross discrimination and repression. The way TADA has been abused has indeed become a matter of grave concern for the Muslim minority. When again Rao is applauded in the media for 'stealing' the Ram temple platform, the apprehensions of the Muslims, who have not yet overcome the shock of demolition of Babri masjid with the government's connivance, are bound further to increase.

Worse was Rao's brazen defence on Independence Day of the policy of depending on foreign capital for developing modern industry and infrastructure for the growth of the economy. Rao actually claimed that the entry of foreign capital on a large scale would release public authority in India from responsibility for the modernisation of the economy. The Indian state, he suggested, would need to take up only schemes for provision of such facilities as education and health once foreign capital came to India in a big way. He went so far as to suggest that even the Indian upper and middle classes would then be absolved of any responsibility and burden involved in making investments in the modernisation of the economy. This was indeed his justification for providing guarantees to foreign investors as done in the case of the controversial Enron power project in Maharashtra to which he made a special reference as an achievement of government policy. Other projects to follow can obviously expect similar treatment. What Rao was offering was the tantalising prospect of no effort on the part of the upper classes in India for the satisfaction of their inflated expectations. There was not a single word, no reference at all, to independent enterprise in the public or the private sector in modern industry and infrastructure. What the prime minister propounded was a philosophy of domination of the Indian economy by foreign interests. This too was in marked contrast to what the president said when he cautioned "against the ingress of alien acquisitive social mores" and emphasised "the need to build a strong, self-reliant India".

While making a virtue of the compulsion to depend upon foreign capital to undertake, under sovereign protection and guarantee of profits, the prime minister claimed that these projects would after all be situated in India. But they will be the property of foreigners and not of India or Indians. Even in the case

of joint ventures, foreign business interests insist on and have been given the right of majority holding and full management and technological control. It is not surprising that Indian industry remains stagnant and investment by Indians in industry is sluggish under the political-policy dispensation of the Rao government.

The latest quick estimates of the Central Statistical Organisation show that industrial production in India grew in 1993-94 by only 3 per cent. The very idea that Indian industry can return to the growth path, in response to the government's economic reforms programme, seems now to have been given up. Industrial production is just not picking up. The capital goods industry in 1993-94 actually recorded a negative growth rate of 5.3 per cent after the negative growth of 0.1 per cent in the previous year. The fall in production of consumer non-durables during the year as compared to 1992-93 was as much as 3.4 per cent. The growth rate of the manufacturing sector was only 2.2 per cent after the 2.1 per cent growth in 1992-93. There was a rise of 14.6 per cent only in the case of consumer durables, mainly the result of generous fiscal incentives. Electricity production, from already established capacities, and the cement and fertiliser industries performed relatively well in 1993-94 so that industrial production as a whole was able to record a growth rate of 3 per cent. Significantly, the performance of Indian industry presents a stark contrast to the build-up of foreign exchange reserves which have crossed $ 17 billion. The finance ministry and the Reserve Bank are now actually concerned over the burgeoning exchange reserves when economic growth continues to be weak and uncertain. Finance minister Manmohan Singh's response has been to permit large-scale import of articles of current consumption, especially consumer durables of interest to the upper and middle classes and to encourage spending of foreign exchange on foreign excursions, education and medical treatment abroad for affluent Indians. The enlargement of the scope for convertibility of the rupee on current account has logically followed.

The questions of 'structural problems' in the way of economic growth, especially industrial growth, still figures in discussions in official circles. But structural constraints must not become alibis for shortcomings in the performance of Indian industry even as the government shirks meaningful structural reforms, among them curbs on monopolistic practices, speculative trading in commodities and stocks and shares and discouragement of Indian R and D and professional management in industrial enterprises. All that the structrual adjustment programme of the government in the last three years has produced is the marked scaling down of investment in industry and agriculture, both in the public and private sectors. Investment and capital formation is being left to foreign capital inflows. Official policy, with liberalisation and globalisation as its cutting edge, is indeed tending to emasculate the domestic impulses of economic growth. The so-called structural adjustment programme of the Rao government has become too much the preserve of a handful of disoriented and corrupt politicians with an extremely narrow vision to be an authentic design for industrialisation and modernisation of the Indian economy.

The mainstream political parties, both the ruling party and the opposition parties, have been too anxious to maintain what is glibly called political stability and have failed to give close enough attention to the opening up of the Indian economy and society to foreign domination. This has been so despite growing social turmoil and sluggish rates of domestic savings, investment and capital formation. It is not possible, however, to escape the consequences of the emerging economic structure. The ruling establishment, on its part, seeks to harmonise the conflict of interests in society by turning to foreign interests to play the leading role in the economy and its growth. It thus tends increasingly to come into conflict with the interests of the mass of the people and assume authoritarian ways of governance. This has been emphasised by the prime minister's August 15 performance.

An artificial majority in parliament contrived by dubious means—the latest move in this direction is to invest Subramaniam Swamy with cabinet rank to supervise the commerce ministry in implementing the GATT treaty—does not make for political stability or efficient administration. And with assembly elections due shortly to be held and time drawing closer for the Lok Sabha elections, the government cannot but find its policy options severely restricted. It is bound to function more and more brazenly as a coterie serving foreign and Indian vested interests. The avid 'salesmen' of Indian labour and natural resources to foreign business interests and the votaries of strategic alliances with the developed countries, in particular the US, are unquestionably fascinated by their friends in high places in the US and elsewhere—for instance, the 22 American multinational corporations who have combined to form what has been called an Indian Interest Group—who, it is being assumed, will show benevolence towards similar interest groups in India. Narasimha Rao is applauded in these circles as the only basis of political stability. But the people must press for a chance to register afresh their political preferences as early as possible

Sundaram Finance Limited

21 Patullos Road, Madras 600 002.

Speech Delivered by
Shri T S Santhanam,
Chairman,

at the Forty-first Annual General Meeting of
Sundaram Finance Limited
held on 18th August 1994, at Madras.

Ladies and Gentlemen,

I have great pleasure in welcoming you all to the Fortyfirst Annual General Meeting of your Company The Directors' Report and the Audited Accounts for the year ended 31st March, 1994 have been with you for sometime and, with your permission, I shall take them as read

WORKING RESULTS

The year under review witnessed a combined growth of 35% in hire-purchase and leasing business in a difficult market Total receivables crossed the Rs 1000 cr mark, making your Company the first company in the private sector to reach this significant milestone

In the area of deposit mobilisation, your Company registered another impressive performance by mobilising fresh deposits to the tune of Rs 118 cr, an increase of 87% over the previous year's figure Net accretion of deposits was Rs 89 cr as against Rs 37 cr previously Total public deposits as at March 31, 1994 exceeded Rs 350 cr and have crossed the Rs 400 cr mark in just 4 months of the current year I wish to express our grateful thanks to our depositors for the faith and confidence in our Company and also to reassure them of our resolve to maintain the highest standards of safety, liquidity and service in handling their funds In this context I would like to mention that it has become necessary for us to review and restructure our fixed deposit scheme to bring it in line with market conditions, and also to bring about a better balance in our deposit mix

The gross profit figure at Rs 85 16 cr also represents a healthy increase of 36% over the previous year Profit after tax at Rs 26 65 cr represents a more or less similar growth pattern enabling the Directors to recommend the highest ever dividend of 45% The tax provision of Rs 21cr for the year under review makes your Company once again the highest tax payer among private sector finance companies in the country All legally - permissible avenues of tax planning are, of course, being explored by your Company with a view to optimising tax liability consistent with its business profile In this connection, I would like to say that leasing as a form of tax shelter should not be carried beyond a point since it entails deferred tax obligations

ECONOMIC SCENARIO

The Indian economy has reached a critical stage in the reform process initiated three years ago by the present Government There has been a pronounced increase in foreign investment inflows and a greater degree of efficiency and competitiveness in the economy. The balance of payments situation is well under control, foreign exchange reserves are at an embarrassingly high level and still rising The current monsoon, since its timely onset ten weeks ago, has been quite vigorous in many parts of the country indications are that the monsoon season would once again end up favourably in most parts of the country - for the seventh year in succession

Against this back-drop it is expected that there would be a perceptible increase in agricultural and industrial production during the current year leading to an overall growth rate of around 5% — significantly higher than the average during the last three years Consequently, the prospects of the road transport industry, which continues to be the main focus of your Company's financing operations, should be better this year

However, two issues of concern are the high - and unabating - rate of inflation in the economy and the liquidity overhang in the banking and monetary sectors It is my earnest hope that the steps taken by the Government to contain inflation would succeed in the next few months, and that, with a more broad-based industrial recovery, the surplus funds in the banking system would get worked off I also wish that more of the foreign investment coming into the country flows into productive sectors rather than into the softer segments of the economy. The basic

objective should be to improve the country's competitive efficiency and bring about a sustained increase in the country's export capabilities so essential for servicing the high level of external debt and maintaining overall growth at the levels projected in the Eighth Plan.

RBI DIRECTIVES TO NBFCs

The Reserve Bank, in the light of the Dr Shah Working Group's recommendations, has issued a set of guidelines for the prudential management of the business of Non-Banking Financial Companies (NBFCs); these are to be effective by March 1995. The guidelines prescribe norms with particular reference to accounting standards, income recognition and asset classification and provisioning. They also seek to lay down capital adequacy ratios more or less on the lines prescribed for banks and ratios governing credit concentration. Some of these guidelines may require fine-tuning. However, I welcome the broad thrust of these guidelines as they are aimed at the orderly growth of NBFCs and protection of the interests of depositors. Your Company is already in a position to fulfill all the norms and standards laid down. Most well-managed and established NBFCs would also perhaps be able to do so within the prescribed time-frame.

In the ultimate analysis, NBFCs would need to develop and maintain a high degree of self-discipline and self-regulation in their activities and, above all, function, as your Company does, within the Reserve Bank's credit and monetary policy framework. Possibly because of misgivings on this score, proposals are afoot to bring NBFCs also within the ambit of the new Board for Financial Supervision set up by the Reserve Bank. I do hope this Board relies more on off-site supervision. In any case, ensuring compliance with the directives and guidelines laid down and proper co-ordination with the other regulatory authorities concerned are both extremely important. At the same time, the investing public also needs to be wary of the several new products and practices that are being developed in the name of financial innovation and dynamism without due regard to their long-term interests.

ROAD TRANSPORT INDUSTRY

The automobile industry gradually emerged out of the recessionary conditions which it had faced over the last two years. The passenger car and light commercial vehicle segments have fared distinctly better and this trend is likely to continue. The offtake of medium and heavy commercial vehicles is also expected to be significantly better this year.

However, the road transport industry deserves a better deal from the Government. A perspective plan aimed at the orderly growth and development of this sector needs to be urgently drawn up. Major issues to be addressed within this policy framework would include:

- Stepping up allocation of funds to this sector, including the building and maintenance of roads. Currently this is around 35% of the revenue earned by the Government from various levies like excise, commercial tax, road tax, permit charges etc. Comparable figures in developed countries are: USA (95%), Japan (127%), Germany (80%).
- Improvement of roadways, both in terms of widening and proper surfacing and construction of more multi-laned highways. Plan allocation for road improvement has dropped from 6.7 % of the total outlay in the First Five Year Plan to below 3% in the Eighth Five Year Plan. This trend needs to be reversed.
- Classifying the road transport sector as an industry and stepping up training facilities, not only for upgrading driving skills but also other necessary techno-managerial inputs.
- Strengthening of highway patrols and communication facilities: the problem of insecurity on roads is assuming serious proportions in some areas and needs to be effectively tackled.
- Encouraging privatisation of passenger transport and also private sector participation in road development.

BUSINESS PROSPECTS

Your Company has written business of Rs.175 cr in leasing and hire-purchase in the first four months of the current financial year as against Rs.145 cr previously. With the anticipated acceleration in economic growth, business prospects should be better this year, though with the entry of banks into hire-purchase and leasing business directly, competition is likely to further intensify. Your Company is confident of meeting competition and maintaining its growth record through appropriate tactical plans and long-term strategies.

LONG-TERM (BOND) RATING

I am happy to announce that CRISIL, the first Rating Agency set up in the country, have very recently accorded their highest Triple-A rating to your Company for bond issues i.e., borrowings from the market on a long-term basis. Your Company is the only finance company to get this prestigious rating which should facilitate raising medium/long-term funds at appreciably lower cost; and a reduction in funding costs should strengthen your Company's competitive ability.

DIVERSIFICATION

The Committee on reforms in the insurance sector appointed under the Chairmanship of Shri R N Malhotra, has since submitted its report. This, inter alia, emphasises the need for de-regulation and privatisation in order to create a more competitive and financially strong insurance industry. Your Company awaits Government's response to the Committee's recommendations, before drawing up specific plans for diversification into general insurance business.

SUBSIDIARIES

The subsidiary companies, India Equipment Leasing Ltd. and Sundaram Finance Services Limited have performed satisfactorily during the year under review and earned a gross profit of Rs. 425 lakhs and Rs. 137 lakhs respectively. Sundaram Finance Services Ltd. has become an OTCEI member and has since set up Sundaram Finance Securities Ltd. as a subsidiary; the latter has become a member of the Madras Stock Exchange and has recently commenced operations.

These two outfits and the equity research capabilities being developed should lend synergy to your Company's capital market operations. These, as distinct from asset-building activities, are more risk-prone and call for a great degree of skill and expertise. Your Company, in line with its basic business philosophy, would like to develop these capabilities in-house to the required extent before venturing to offer capital market related products to the public. All the more so because stock markets, as the events of 1992 have shown, can be extremely volatile causing steep erosion in net asset values in many cases.

ACKNOWLEDGEMENT

On behalf of the Board of Directors and on my own behalf, I take this opportunity to thank our other customers, bankers, financial institutions and share holders for the co-operation and assistance extended to your Company. I look forward to their continued support. I also place on record my appreciation of the good work done by all members of the staff both in the field and in the office.

Note: This does not purport to be the proceedings of the Annual General Meeting of the Company.

KARNATAKA

Politics of Reservation

Ambrose Pinto

The July 25 notification of the Karnataka government is an illustration of how, yet again, the dominant castes in the state hold sway in state politics

THE third backward classes commission of Karnataka constituted on March 9, 1988 headed by Justice O Chinnappa Reddy submitted its report on April 7, 1990 The two politically powerful communities of vokkaligas and lingayats were kept out of reservation by the commission It is not for the first time that these two communities have been kept out of the reservation purview

Karnataka has a long history of reservation The concept of 'other backward classes' is not new in the state The Millers committee perhaps the first backward classes committee appointed in the country by the Maharaja of Mysore in 1918 was to check the preponderance of the brahmin community in public services The Maharaja being a great visionary wanted the other communities in the state to be adequately represented The Millers committee while submitting its report considered all non-brahmins as backward

When attempts were made to extend benefits to the OBCs (other backward classes) in the post-independent era the high court in 1958 quashed reservation based on a single indicator of caste In striking down the order the court discovered that the beneficiaries of the scheme in the pre independent era were not the socially and educationally backward classes as envisaged in Article 15(4) The court felt that there was no intelligible principle in classification by the Millers committee and communities with high percentage of literacy were included in the OBC list The court struck down the states classification as arbitrary The Mysore government then appointed the Nagan Gowda Committee on January 9 1960 to suggest criteria for backwardness The committee evolved three criteria to classify backward classes "(i) The social position which the community or caste occupies in society (ii) The general educational backwardness of the community on the basis of the high school standard of education (iii) Representation the community has in government service"

Based on these criteria lingayats and bhunts section of the vokkaligas were excluded from reservation benefits The remaining vokkaligas were on the list Yet at the stage of implementation the state government was unwilling to allow lingayats along with bhunts to be omitted from the OBC list

Then came the first backward classes commission in 1975 under the chairmanship of Havanur The findings of this commission were not very different from the Nagan Gowda committee report as far as lingayats and vokkaligas were concerned To quote from its report "The committee is of the opinion that the entire Lingayat Community is socially forward All sections of Vokkaligas excluding Bhunts are socially backward Bhunts are socially forward" There was such an uproar by the lingayat community against the report that the government found itself under political pressure not to implement it

Exactly 10 years later in 1985 the government of Karnataka appointed the second backward classes commission under the chairmanship of Venkataswamy In its recommendations the second backward classes commission went a step forward and excluded the vokkaligas from the OBC tag Both the groups were considered overwhelmingly forward The competition between both the groups of lingayats and vokkaligas for the backward class tag was so acute the report observed "an unhappy and disquietening situation in Karnataka wherein the two premier caste community-classes of Karnataka, the Lingayats and Vokkaligas each claiming that the other is not a socially and educationally backward class and each keen to be included in the list of socially and educationally backward classes" There was such a public outcry against the report, that the then chief minister of Karnataka Ramakrishna Hegde did not dare to hurt the sentiments of both the dominant caste groups with a view to consolidate the Janata Party rule in the state The government order of 1986 provided for 68 per cent reservation and covered 92 per cent of the population including the socially and politically powerful lingayats and vokkaligas

A third backward classes commission was then constituted in 1988 under the chairmanship of O Chinnappa Reddy The Chinnappa Reddy commission which submitted its report in 1990 affirmed the results of the Venkataswamy commission as far as lingayats and vokkaliga communities were concerned The observations of the third backward classes commission on lingayats are pertinent here

> 28 58 per cent members of the Lok Sabha elected from the state of Karnataka, 27 93 per cent members of the legislative assembly and 32 88 per cent of the members of the Legislative Council are Lingayats 46 3 per cent of the surplus land holders in the state belong to this community 15 68 per cent of the total number of seats in Professional Colleges and Post graduate institutions were secured by the members of the community as against their population of 15 34 per cent In regard to entry into the services they were able to secure 17 71 per cent of the posts in the recruitment prior to 1986 and 16 68 per cent of the posts in the recruitment immediately after 1986 From these figures only one conclusion is possible and that is that the Lingayat community cannot be classified as a socially and economically backward class

Examining the vokkaligas as a community the Chinnappa Reddy Commission observes

> Vokkaligas are the next predominate caste in Karnataka 17 86 per cent of the members of the Loka Sabha 18 02 per cent of the members of the Karnataka Legislative Assembly and 17 86 per cent of the members of the Karnataka Legislative Council are Vokkaligas 13 9 per cent of the surplus land holders are from this community In the matter of admission to professional colleges and Post graduate institutions they were able to secure 11 63 per cent of the seats while in the matter of recruitment of services they were able to secure 11 99 per cent of the posts before 1986 and 12 92 per

TABLE FOUR CATEGORIES OF RESERVATION IN KARNATAKA

Government Order of April 20 1994			Cabinet Decision of July 23 1994		
Category	Percentage	No of Castes	Category	Percentage	No of Castes
Most backward	5	83	Most backward	7	93 castes
More backward	28	14			14 castes
			Backward A	20	Muslims
			B	6	Setty Buddhists and SC converts to Christianity
Backward	12	15 include rural Vokkaligas Lingayats	Backward A B	Vokkaligas, 8 Lingayats 11	15 castes
Occupational group	5	-	Occupational group	5	
Total percentage for OBCs	50	112		57	126 castes
SC and STs	23	-		23	
Total reservation	73	-		80	

cent of the posts after 1986 Their performance all round has been more than satisfactory

Vokkaligas cannot be classified as backward

The percentage of vokkaliga population is 10 80 per cent in the state Yet at the stage of implementation of the report no state government worth the name could exclude the lingayats and vokkaligas from the benefits of reservation With the power these two communities have come to acquire to make or unmake a government, the state has always yielded to their interests Hence when Chinnappa Reddy Commission submitted its report which was hailed as a scientific document it was not expected at least by those who were aware of the political scenario of Karnataka that the report would ever be implemented *in toto* As expected, the then chief minister Veerendra Patil, a powerful lingayat leader instead of implementing the report constituted a cabinet subcommittee to study the recommendations Before the subcommittee could submit its report, Veerendra Patil was out of power Bangarappa who took over the reins instead of permitting the committee to perform its task reconstituted another subcommittee When Veerappa Moily took over, the subcommittee was reconstituted for the third time None of the chief ministers wanted to take on the wrath of the two dominant communities

Finally on April 10, 1994 when the state government announced its resolve to implement the report as modified by the subcommittee the purpose seemed more to appease the dominant groups rather than empower the socio economically weaker groups The Chinnappa Reddy Commission had suggested the scaling down of reservation to 38 per cent from the existing 50 per cent The Moily government found itself quite weak to act on the report Given the Congress dissidents' demand for their pound of flesh and the simmering discontent of the vokkaligas and lingayats within the party the chief minister could not afford to implement the report The inclusion of rural vokkaligas and lingayats who were made to share 12 per cent reservation was a device to appease them in spite of the recommendation of the commission to the contrary But that did not satisfy the dominant groups With their large representation in the legislature and the politics of the state both the communities were able to bring enormous pressure on the leadership of the state The cabinet finally had to yield

Backtracking

On July 23 the state government modified its earlier government order of April 20, 1994 and increased the quota for backward classes from 50 per cent to 57 per cent besides bringing the entire vokkaliga and lingayat communities under the ambit of reservation The inclusion of the two dominant groups militates against the principle of compensatory discrimination When the dominant groups make a demand for reservation, the genuine OBCs do not get their due

The April 20, 1994 government order had a number of positive features The quota for the SCs was enhanced from 15 per cent to 18 per cent and for STs from 3 per cent to 5 per cent The chief minister had explained the increased quota for SCs and STs on the ground of their increased numbers Not that there were many takers for the CM's explanation The SCs and STs in recent years and months have been moving away from the Congress fold The Dalit Sangarshan Samithi the most organised dalit organisation, was with the Janata Dal Recently a big chunk of them have joined the Bahujan Samaj Party There are very few dalit organisations that support the Congress Those who are with the Congress are moving away To stop the trend further, the SCs and STs have been provided with increased quota Will the enhancement of reservation return them to the Congress fold? With the present attitude of using the dalits as pawns by the politicians and an awareness of it among dalits it is unlikely this will happen

Another positive element in the April G O was the state government's acceptance of the 'creamy layer' norm of the Mandal Supreme Court judgment and of Chinnappa Reddy Commission

> There will be no reservation if either parent of backward class candidate was a class one or two officer in government or earns pay equivalent to a class two officer in the private sector either parent is a professional or income tax or sales tax assessee or either parent owns more than eight hectares of rainfed land

However the suggestion of the commission to exclude children of graduate parents did not find favour with the cabinet The government felt that the graduates could be unemployed and hence needed protection However, the creamy layer norm did not apply to SCs and STs Moily in his second order modified this too The most backward category was not subject to creamy layer The concept was further amended to exclude doctors, lawyers chartered accountants income tax consultants, dental surgeons, engineers and architects who are not assessee under income tax wealth tax and sales tax for all categories

For the first time occupational groups regardless of caste were brought under the purview of reservation in accordance with the recommendation of the Chinnappa Reddy Commission These include agricultural labour, marginal farmers with holdings of less than one hectare dry land, handloom weavers working for wages, construction workers, automobile drivers, conductors, cleaners, auto and cycle rickshaw drivers employers in factories excluding supervisory and managerial staff and workers on daily wages in various menial occupations The occupational groups were not altered by the modified G O

In fact the cabinet on April 20, 1994 had endorsed the decision of the cabinet subcommittee to include 32 castes which the commission had left out In the July cabinet decision the cabinet decided to do away with the urban-rural divide in respect of vokkaligas and lingayats in the backward category Besides the lingayats have got as much benefit as the vokkaliga community in the modified list In an obvious bid to appease as many sections as possible the government brought in the gollas from category two to category one In spite of the government's decision to revise the policy, the vokkaligas were not satisfied Their fear was that the numerically strong lingayats would cover more benefits in the category in which the two had been clubbed The cabinet approved the proposal to split the vokkaligas and lingayats

The increase of quota from 73 per cent (50 per cent for OBCs and 23 per cent for SCs and STs) to 80 per cent was done overriding the opinion of the law department In fact the state has already appointed a permanent backward classes commission in accordance with Supreme Court decision A decision of the type Moily took to hike reservation should not have been taken without reference to the permanent backward classes commission which was appointed by the Karnataka government by its order dated April 26, 1994 The major change in the modification of the government order appears to be the result of political pressure rather than social compulsion The modifications made by the state cabinet while accepting the recommendations of the Chinnappa Reddy Commission in April had already diluted the original spirit of undoing the injustice done to the socially and educationally disadvantaged sections of society The further modifications of the July 23 decision of the cabinet was not doubt to negate the basic philosophy of the reservation policy

Moily had dubbed the 1986 reservation policy of Ramakrishna Hegde then chief minister which had provided 50 per cent reservation for OBCs and covered at 92 per cent of the population, as a fraud But the Moily government's intention is to appease as many sections as possible Yet it is not very clear what the decision the high court where a petition questioning 73 per cent reservation is pending and the Supreme Court will take The government of Karnataka has assured the Supreme Court that it would not implement its July 25 notification On August 2 the state government froze the process of admissions to professional colleges following its undertaking to the Supreme Court On a critical examination of the reservation issue one thing is clear that those who have power—political and economic—eat up much of the benefits It is only the dominant groups that can exercise pressure on account of their social and organisational abilities The weaker groups do not have sufficient social skills to organise themselves The result is that the really weaker groups do not benefit from compensatory discrimination Karnataka is a case in point Even among the SCs/STs it is the 'creamy layer' that has benefited the most from state's action Given the vast population of SCs and STs and continued atrocities on them if the government is serious about their empowerment the 'creamy layer' principle could have been applied to them too In a country where such a magnitude of poverty exists, there is no point in not applying the principle of 'creamy layer' for all OBC groups if the government believes in empowering the weaker groups.

Urban Water Supply in Rajasthan

Problems and Prospects

M S Rathore
V Ratna Reddy
S Ramanathan

The growing problems in providing adequate drinking water to urban populations is a consequence of the lack of long-term planning and inefficient management of urban water usage

INCREASING urbanisation is an universal phenomenon and Rajasthan is no exception Urban population in Rajasthan increased at the rate of 3 08 per cent per annum as compared to the overall population growth of 2 56 per cent between 1951 and 1981 The annual growth rate during the last decade, i e, 1981-91 was 3 44 per cent This coupled with lack of appropriate policies for developmental planning has led to the deterioration of physical environment and quality of life on account of the widening gap between the demand and supply of essential services and infrastructure Supply of safe drinking water in urban areas is one of the most strident problems among the social consumption items and hence needs top priority The increasing shortages in urban water supplies was not only because of the faster growth in urban population but also due to the inefficient management and usage of water apart from the modern urban life-styles It is in this context important to examine various aspects of urban water supply (i e, demand, supply, shortages, finances, management, etc) in order to formulate appropriate policies

Keeping this in view, a seminar was organised to discuss the problems of five major cities of Rajasthan, namely, Ajmer, Bharatpur, Jaipur, Jodhpur and Udaipur Three resource persons from each city representing government, academics and NGOs were identified to highlight the issues of urban water supply These issues include (a) the present status of the city water supply along with the historical account of growth of the city, (b) technical interventions in augmenting supply, problems faced and solutions proposed, and (c) how these problems can be resolved though various policies related to pricing, subsidies, technology, institutions, etc

The Director, IDS(J) while inaugurating the workshop outlined the water management and development programme which is aimed at preparing a policy document on water use in the state The topic of the workshop apart from being a part of the research programme has great importance as the problems of urban water supply are unique to each city/town of the state The experts who participated in the workshop were drawn from different disciplines to offer different perspectives which may be mutually supportive and help in arriving at concrete and specific proposals for easing the problem

The deliberations started with the inaugural session pointing out some very pertinent issues in the field of urban water supply in Rajasthan These issues were (i) lower per capita water availability in the state than other states in the country (ii) regional variation in the supply and distribution of water across the state, (iii) the present policy of centralised water supply system leading to extensive wastage because of the lack of participation of the people in various government schemes, (iv) highly subsidised drinking water supply to cities overlooking the costs, leading to heavy losses to the PHED It was suggested that the present problems can be solved by involving and educating people, conjunctive use of surface and ground water to meet the increasing demand, formulating appropriate price policy, etc

The Project Co-ordinator outlined the details of the water management research programme at IDS The broad issues of the research are augmenting the supply of water, conserving the available supply, efficient use of the available supply, equitable distribution of water, and reducing the environmental damage

An overview paper titled 'Managing Basic Amenities A Study of Urban Residential Water in Rajasthan', focused on a shift towards demand management of water resources rather than depending on the conventional supply management The main conclusions of this paper, which is based on the data for 201 towns in Rajasthan, were (i) The share of municipal water demand is 5 per cent while the demand for irrigation and industry ranges between 88 to 94 per cent and 1 to 6 per cent respectively Of the municipal water demand 44 per cent is of urban residential demand (ii) The gap between the demand and supply of water is around 58 per cent This gap is not solely due to supply constraints as the districtwise analysis shows that excess capacities do exist in the state (iii) The revenues from water do not even cover the working expenses The price inelastic nature of water demand indicate the possibility of raising resources without impairing the quality of life (iv) Capacity utilisation and distribution of service connections would result in higher per capita consumption of water due to the absence of effective distributional systems (v) As the size of household increases the per capita consumption tend to decline The per capita consumption levels appear to be lower in high rainfall regions when compared to low rainfall regions Another overview paper titled 'Urban Water Supply Issues and Approaches', highlighted two main issues for discussion, i e, first water pricing and secondly the resource constraint in implementing water augmenting schemes Regarding the pricing of water the present pricing system of slabs is not appropriate for two reasons, firstly, it covers only 40 per cent of the total expenditure on operation and maintenance of urban water supply schemes, secondly, it is not progressive in real terms, i e, neither effective in curbing the demand nor equitable It also fails in controlling the inefficient use of water A new tariff structure based on the ability to pay and some cost considerations has to be evolved It was pointed out that the state always face financial crisis hence sufficient funds are not made available to cope with the increasing urban water demand, and, therefore, mostly contingency plans are made to tackle the immediate problems The growing size of cities and depleting water supply are always a challenge before the PHED

City Specific Issues

Four papers were presented on Jaipur City water supply All the papers dealt with the historical aspects of Jaipur water supply schemes which dates back to 1727 AD, when water was supplied from big public wells 'jhalaras' constructed in each of nine 'chowaries' Besides, there were traditional sources of drinking water, especially to facilitate the poorer sections Since then the city water supply schemes have undergone numerous changes These changes were mostly of the nature of diversion from irrigation to drinking, upgradation and expansion of the existing supply systems and construction of new schemes to meet the increasing demands of the growing population In doing so the supply sources have changed from local water bodies to distant irrigation projects Presently the scheme has the capacity to supply 193 million litres per day (MLD) as against the demand for 254 HLD And the demand—supply gap is expected to increase in the coming years and the anticipated water shortage in the year 2031 is about 88 per cent

The withdrawal of ground water resources has led to the decline of ground water table and deterioration of ground water quality in many parts of the city Though, the intervention policies of the state helped in providing clean and healthy drinking water, they have been detrimental in some ways For instance, the community managed water sources have gone into disuse Open wells have either dried up due to depletion of ground water or have sunk for want of maintenance The community initiative and self reliance have been lost and instead there has been a total dependence upon the government Further, there is a clash of

interests in the use of ground water in the areas nearby Jaipur. The agriculturists resist any further tapping of ground water since it adversely affects their existing system and their demand for water.

It was pointed out that water charges do not even cover the working expenses for the supply of water. In fact, in 1990-91 it covered only 61.74 per cent of the total annual maintenance expenditure. In a specific reference to the economic and technical problems in the management and distribution of water in Jaipur the following points were noted: (i) Too much dependence on ground water and poor recharge due to insufficient rains leading to increase in the depth of water table; (ii) High production losses owing to technical reasons and lack of maintenance; (iii) Leakages in the distribution system and low cost recovery; and (iv) Low emphasis on deployment of advanced technology.

The long-term solution is to transport water from Bisalpur project or Banas project and improve efficiency in distribution. Several suggestions were made and discussed for improving the water supply situation including the drawing up of a water recycling plan, use of modern technology, a proper sewage system, etc.

Udaipur city is located in the Aravalli Hills and the topographic advantages are fully used by creating artificial lakes and tanks. These water bodies are the main source of city water supply. The rainfall in the region is much higher than the rest of Rajasthan. Water harvested in these artificial lakes and ponds used to be sufficient to meet the city water requirements in the past. But due to mounting population pressure, at the annual rate of 2.84 per cent over 1981-91 and 3.63 over the period 1971-91, increase in size of city, setting up of new big industries in and around the city, unplanned land use pattern, mismanagement of traditional water sources, etc, the gap between the supply and demand for water is widening. It was mentioned that as against the daily demand of 184.6 lakh gallons the supply is of 65 lakh gallons from the two lakes, viz, Pichola and Fatehsagar. Part supply is also met from ground sources, such as open wells, tube-wells, etc. The projections for the future demand for water for the year 2021 will be 230 MLD. Experts were of the view that the present supply sources would not be able to meet this demand and hence there is need for timely action to augment the supply. Efforts made in this direction have not materialised for more than one reason. Above all, the problem of pollution of these traditional water bodies is increasingly felt. Attention was also drawn to the high distribution losses in the supply system and inadequate pressure in the lines. Mention was made of the large number of handpumps installed by the government and most of them are out of use. The small traditional sources, such as 'baories', which used to meet the significant part of demand are in bad shape just for want of attention. People's participation in maintenance of supply sources are not forthcoming. Strong plea was made by the NGO participants to look into the emerging rural-urban conflict because of a particular city water supply scheme, which is evident examples even in other parts of Rajasthan. There is urgent need for drawing a master plan for the city in the absence of which there is unplanned expansion of city and slum areas. Moreover, municipal corporation keeps dumping the city sewage and garbage into the water bodies leading to water pollution. Technically, the surface structure of Udaipur region is rocky with faults/cracks and there are many small and big valleys which can be used for ground water recharge and storage. This can be achieved by construction of anicuts across the valleys. Also the Zhawar Kotra mine area is a good potential source of water presently unutilised. As the silting of lakes has become a major problem, it was suggested that catchment area treatment plans have to be made for all the existing water bodies and be implemented without further delay. Also some of the water bodies be exclusively reserved for drinking water and the quality of water be maintained at all costs.

Bharatpur has a typical, physical and hydrogeological features. It is situated in the alluvial basin of the river Yamuna at the meeting point of two slopes from north and southern parts of the region forming depression with a saucer like topography and has thus been prone to flooding during heavy rains. The slope gradient towards Yamuna is not adequate enough to allow the surplus water flow into the Banganga and Gambhir rivers. Natural drainage of Bharatpur district lies towards south thus water stagnates in and around Bharatpur town in lakes, moats, canals and huge pools causing severe floods. The ground water is saline for various geo-hydrological reasons. Therefore, for drinking water the total dependence is on traditional surface water harnessing systems or the upper level aquifers, i e, up to 15 metres depth. The population of the city increased at the rate of 4.07 per cent over 1981-91 and 4.12 per cent over 1971-91.

Though the city of Bharatpur is older than Jaipur, the modern water supply schemes came into operation only recently, i e, 1960s. Prior to that the people of Bharatpur were depending on the moat which used to recharge city wells. These sources of water were maintained and managed properly through judicious water harvesting systems. The system used to work so perfectly and advanced that all the river systems were inter-linked to face any eventuality of diverting waters from any of the river system at the time of short or surplus water flows. Every river had, therefore, is an independent as well as interlinked system. However, this system stands defunct today due to the negligence on one hand and the waters of these rivers have been intercepted upstream of Bharatpur on the other.

As far as the distributional problems are concerned it was pointed out that the use of boosters is resulting in uneven supply and low pressure in the pipes. Though this problem of boosters was solved to some extent through imposing power cut during the supply hours, but appropriate measures need to be taken to tackle this problem. As regards the quality aspects of water it was pointed out that the present practice of mixing of brackish water with sweet water is not a proper way. Instead, the ground water should be treated properly before supplying it. Besides creating a storage on river Banganga and damming the river Gambhir the proposed scheme of lifting water from Chambal for drinking purposes should be cleared immediately, it was felt. Firm steps should be taken to get Rajasthan's legitimate share in Ganga and Yamuna waters.

Several suggestions were made for improving the city water supply including the creation of a storage on river Banganga near village Todana in district Sawai Madhopur; constructing of a low level dam across river Gambhir near Bayana to pick-up releases from Panchna Dam already under construction bringing water to Bharatpur by a canal, etc.

Jodhpur city has unique problems being located in the desert regions of western Rajasthan. Till the beginning of this century the city's water requirements were met by the indigenous techniques of harvesting water through 'talabs', 'nadis', 'baories' and 'jhalaras' in total about 216 water bodies. The hills around the city were excellent catchments for harvesting water, and the water was conducted to the lakes or sagars by channels. The seepage from these helped to recharge the ground water and provided excellent sources of drinking water to the population living downstream. Piped water supply became available in 1925.

The increasing population (at the rate of 2.84 per cent over 1981-91 and 3.63 over 1971-91) and the poor attention given to these indigenous sources led to their neglect. Due to the encroachment of the catchment area and the rise of housing colonies, some of these sources have been turned into dumping ground for municipal waste. Some are, however, in use and supply drinking water to the public. The depth of ground water in more than 60 per cent of the area varies from 40 to 150 metres deep, and that more than 60 per cent of the available water is saline and hence unfit for drinking. And hence water had to be transported from far.

This began in 1938 when the then ruler of Marwar state constructed an open channel to transport water from Sumer Samand in Pali. In 1958-59 a project was completed to transport water from Jawai dam about 180 kms away. Now, it is proposed to draw water from the Indira Gandhi Nahar to provide drinking water. In the interim due to the poor rainfall, and given the acute scarcity of water the ground water in the nearby regions were tapped between 1970 to 1987 leading to a sharp decline in the depth of ground water in these regions. Since 1935 about Rs 15,398 lakh have been spent on providing drinking water to the city, and of this the investment on the Indira Gandhi 'nahar' alone accounts for more than 75 per cent.

No investment is being made to improve the status of the indigenous irrigation sources, and no department is willing to take up the responsibility. It was pointed out that the people who were once the users of the system are now destroying it by encroaching upon the catchment. The cost of providing water works out to about Rs 10 per kilolitre whereas the users are charged Re 1 per kilolitre. And, as the number of connections increase the deficit of the PHED also increases. Consequently between 1989-90 to 1992-93 the charges collected from the users as a per cent of the direct expenditure of supplying water declined from about 38 per cent to about 28 per cent. If we include the indirect cost then the recovery as a per cent of total expenditure would be much lower. As a result of this the services have deteriorated and water is being supplied only on alternate days in the city. Experts were of the view that surface water storing (in desert areas where the average temperature is high) was not a good method. Ground water can be recharged artificially by harvesting the rain water. The main issues that emerged from the three presentations were: (a) Pricing of water. The existing slabs of water charges need to be rationalised. At present the first slab is at 10,000 litres and the second slab is between 10,000 and 1 lakh litres. Apart from the rationalisation of the slabs there is a definite need to increase the rates so as to cover at least the working expenditure. (b) Capacity to pay. Linked to (a) above is the issue of capacity to pay between those who use stand posts and those who have house connection, between those who live in the slums and those who live in colonies, and between different localities in the city itself. (c) Norms of water consumption. Do we have to necessarily follow the GOI and WHO norms of providing water or, do we work out alternate norms given the situation in the state? (d) Indigenous systems in providing water should be recognised and necessary budgetary allocations for their upkeep made. In extending the catchment area of obtaining water to the city the interests of the hinterland is severely affected leading to migration from these regions imposing further burden on the services that has already been stretched. This has also been leading to conflicts.

Ajmer city is situated almost in the centre of Rajasthan. It lies on the foothills of Aravalli Range. The city is situated in a valley rather than a basin, which it is said was once the bed of Sagaramati river. During the British rule when it became the military headquarters of the British government in this region. The history of modern drinking water supply system started with the British efforts to construct a lake called Foysagar in 1892 which was completed in 1907. After that several projects were taken up but the supply was never adequate to meet the growing water demand of increasing population pressure. The city population increased at the rate of 0.68 per cent during 1981-91 and 2.12 per cent over 1971-91. The relative low growth of the city is attributed to the water scarcity problem.

The shift from surface water systems to ground water supply systems resulted in the neglect of local water bodies or the lakes. Consequently, the ground water recharge capacity in and around the city went down. The massive deforestation in the Aravalli mountains on the city boundary and the catchment areas of the water bodies added to the problem. It was argued that the three lakes, namely Anasagar, Foysagar and Pushkar, must be saved from encroachment and maintained at all costs so that the huge investment made in installing large number of handpumps in the city can function. Further, new schemes taken up to solve the city water supply problems, particularly the Bisalpur Project should be examined and efforts be made to supply water at an early date.

There is an urgent need to undertake a large scale afforestation programme and also measures be taken to check encroachments on the forest land. And, ground water survey of Ajmer city be taken up at an early date to identify the water potential areas and also to know the limitedness of the existing handpumps.

After a brief discussion on the major issues which had emerged earlier the participants agreed to the following suggestions/recommendations. These suggestions can be classified under four broad headings, such as (i) relating to the augmenting supply and efficiency in distribution, (ii) conservation of water and economising use, (iii) people's participation, (iv) management and development.

Policy Suggestions

Augmenting Supply and Efficiency in Distribution. Urban water bodies and their catchment area is presently utterly mismanaged and being encroached both for public and private purposes. There is an immediate need to declare their ownership and demarcate these areas. And also suitable measures be taken to recover the encroached area. A long term plan for development and maintenance of water bodies needs to be evolved for each city rather than contingency plans statewide. A statewide large scale afforestation programme should be taken up in order to improve the overall water supply position. The upgradation of water distribution and treatment technologies should be taken up for efficient running of water supply schemes. Leak detection instruments should be used to minimise distribution losses. In order to sustain urban water supply ground water resources should be judiciously used. Overexploitation of ground water should be avoided.

Conservation of Water and Economic Use. Water conserving technologies should be developed by more investment in R and D. Water conserving technologies should be adopted through proper pricing policies, legislation and institutions. Immediate attention is be paid to recycling of water in most of the cities. Proper studies be initiated to assess the household water demand or water use pattern to work out the possibility of supplying graded water for different usage. Public awareness campaigns be started to conserve water or economic use of water. Rural water resource conservation should be taken care of while meeting the urban demands.

People's Participation. There is a need for educating the public on cost of water supply and need for seeking their co-operation in conserving water and willingness to pay for water. To improve the pressure in the service lines replacement of old pipes should be taken up on a regular interval of 10 years with the co-operation of consumers. Efforts should be made to seek people's participation in maintaining and controlling pollution of urban water bodies by formation of consumer forums, wardwise water users committees, etc.

Management and Development. The management and development of water resources can be operationalised in at least two ways: one, by making market forces effective i.e., using price factor and second control by way of legislations and regulations. Pricing of water is an important tool for efficient utilisation of water resources and also increasing the viability of water supply schemes. Pricing policies be conceived at different levels. It was suggested that following aspects may be considered for formulation of appropriate water price policy: (a) cost pricing, (b) progressive pricing with appropriate slabs of water consumption, giving due weightage to the type of use, (c) differential prices across income groups taking care of equity and social justice. Centralisation of water supply schemes has adversely affected the urban water supply and hence there is a need for decentralisation through peoples' participation. Privatisation of water supply and sanitation sector to improve efficiency, effectiveness, reliability and sustainability. Government should take the role of macro-distribution (i.e., wholesaling) rather than individual system. Within colony distribution can be handed over to either consumer forums, societies, etc. To overcome the financial constraints in formulating and implementing long-term plans, appropriate formula be devised to transfer part of the house-tax, asset tax and municipal tax collection to PHED, as this basic facility also adds to the escalation of asset value in cities. There is an urgency for regulation and policy legislation with regard to ground water use. The process of urbanisation needs checking by way of direct and indirect measures. High water using industries should be strictly evaluated before sanctioning and in all cases be kept far away from urban centres. The existing pollution control laws applicable for pollution of water bodies should be strictly implemented. The Human Resource Development Programme for engineers and other technical staff in the PHED be taken up. Upgradation of public dealing staff will form part of this programme.

South Korea: A Replicable Model?

The remarkable transformation of South Korea from one of the poorest countries in the world 40 years ago to the 'industrialised country' that it is termed today is rooted in historical developments which predate its current export-oriented, liberal policy regime.

AMONGST the countries which are held up as role models for India to follow in implementing economic reforms, South Korea's case of an export-oriented, liberal policy regime is being repeatedly emphasised This however ignores the enormous body of literature which shows that the South Korean case is indeed special The Organisation for Economic Cooperation and Development (OECD) has recently published an economic survey (1993-94) on South Korea, the second for a non-member country, (the first being that on Mexico in September 1992) The occasion, of course, is that the government of Korea has expressed its intention of seeking full membership of the OECD by 1996, the country has been participating in various OECD bodies and has been conferred observer status in the latter's numerous committees Though it is argued in the survey that the South Korean case for joining the rich nations' club is based on the remarkable strength that its economy has acquired during the past three decades it is its external orientation that would have clinched the issue Korea's total foreign trade constitutes about 56 per cent of its GNP, it is the 13th largest exporter in the world with shipments to OECD countries accounting for more than 55 per cent of its total merchandise exports At US $ 65 billion, there are only nine OECD countries whose export levels are higher than that of Korea. Of course, the overall size of the Korean economy has exceeded that of 16 member countries of OECD during 1993 The country's per capita income placed at near $ 7,000 is thrice that of Turkey and close to those of Portugal and Greece

The transformation of the Korean economy from one of the poorest countries like any other Asian country 40 years ago to what is described by the OECD as an industrialised country today is a remarkable history of the most rapid growth for any country in the world. The Korean war (1950-53) had destroyed almost two-thirds of productive capacity and almost one million people were killed After initial uncertainty, the country embarked on sustained economic development in 1961 During the following 30 years, the average annual GDP growth of 8 4 per cent or per capita income growth of 7 0 per cent per annum has been one of the highest in the world for such a prolonged period The proportion of people below 'poverty line' fell from 40 per cent in 1965 to less than 10 per cent, with the improvement in living standards reflected in many other socio-economic indicators Significant structural changes have taken place in the Korean economy The share of manufacturing in GDP has doubled to the peak of one third in 1987 and within manufacturing heavy industry which includes chemicals, iron and steel, metals, machinery and transportation equipment, increased its share of manufacturing from about one-fourth in 1961 to two-thirds by 1992

The OECD survey suggests that the distribution of household income is one of the most equitable amongst the developing countries which arose from two factors the initial result of land reforms instituted in the late 1940s and the subsequent rise in labour share of income except for the 1970s when heavy and chemical industries were strongly promoted It is said that the high level of literacy also helped to augment wage share in national income

As for the sources of growth it is the rapid growth of factor inputs, primarily capital and labour, rather than the growth in total factor productivity, that have been the major contributory factors Exports have played a key role in Korea's economic development but export-orientation has been combined with a deep import substitution strategy Rapid export growth was accompanied by a sharp change in the composition of exports, with the share of manufactures in total exports rising from 12 per cent to 95 per cent Besides in the early 1970s labour-intensive products such as textiles and apparel, wigs and footwear, accounted for two-thirds of exports, but by the early 1990s, more advanced products, led by electronic goods dominated the list of major exports the share of technologically advanced goods have increased from 2 per cent in 1961 to 60 per cent now

Making an international comparison of the Korean economy, the OECD study finds that the country possesses many of the characteristics of an advanced country the large share of manufacturing in total output, the sizeable share of exports and in particular exports of manufactured goods, the importance of tertiary education, low birth and death rates and many other comparable social indicators There are also significant differences from other OECD countries, relatively small public sector and lower government expenditure the agriculture's share in total output and employment still remaining high and significant productivity differences as between sectors

The underlying social and political forces that have guided the remarkable economic performance, as presented in the OECD's economic survey although briefly, obviously appear as such a complex set that it is less amenable to replication elsewhere Reading between the lines, one does discern that the historical background the social setting, and the nature of political governance have all been of a type specific to South Korea Apart from being a unified and independent country with no colonial exploitation for over thousand years until Japan annexed Korea in 1910 the philosophy of Confucianism, as in China placed great emphasis of education and frugal living Though Japan extracted rice from Korea during its occupation until the end of the second world war it encouraged investment in manufacturing and mining enterprises *albeit* to strengthen its own military power By 1938, the share of manufacturing in total output had already risen to 20 per cent though large-scale enterprises were still the domain of Japanese firms After the country was partitioned in 1945 on Japan's defeat in the war and until 1953 when the Korean war ended, the country was in disarray The post war period nevertheless saw many economic measures which laid the foundation for future development A revolutionary reform was the introduction of a fundamental land reform in 1948 land expropriated from landlords was given to the previous tenants and the size of individual holdings was restricted

After Korean War

The post Korean war period (1953-1961) was a period of reconstruction and what was achieved was less noteworthy The economy stagnated with the per capita real GDP rising by only 1 per cent annually Exports constituted only 5 per cent of GDP by 1960 The root cause of the trouble apparently was the preferential access to massive foreign aid that averaged as much as 7 per cent of GDP between 1953 and 1960, which in turn was a notorious source of rent seeking This was followed by four successive phases of economic reforms and rapid economic growth (i) export promotion with strong import substitution bias 1961 to 1973, (ii) the heavy and chemical industry drive again with import substitution as the goal 1973 to 1980, (iii) economic liberalisation 1980 to 1987 and (iv) democratic reforms 1987 to the present

An outstanding aspect during the whole time was the remarkably intensive pursuit of an interventionist policy regime by different governments in South Korea which have all shown an ability to adapt policies "to rapidly changing circumstances". In the early export-promotion phase which was thought of as an answer to the lack of domestic resources, apart from significant devaluation in 1964, aggressive steps were taken to enhance export competitiveness and promote exports. At the same time, interestingly, the level of protection was kept high in industries without strong export prospects and low in internationally competitive industries. What is more, research studies have shown that significantly, in the aggregate, export promotion measures made the incentives to export and to sell in the domestic market roughly equal. The heavy and chemical industry drive (1973 to 1980) was based on the need to move from light manufactures to large-scale, risky investments "which would not be undertaken without decisive government leadership" and it was intended to anticipate changes in Korea's comparative advantage by focusing on the iron and steel, non-ferrous metals, shipbuilding machinery and chemical industries. This programme was specifically considered as a sector-specific, import-substitution plan relying essentially on the allocation of credit to the favoured industries, apart from selective trade and tax policies to promote such industries. For this to be achieved the 70-odd well known industrial conglomerates of 'chaebols' were consciously supported.

The 1980s saw two five-yearly tariff reduction plans, on the one hand and conferment of democratic rights to labour which were denied under earlier totalitarian regimes. This period also saw an extremely careful sequencing of financial sector reforms. In the early 1980s, contrary to initial intentions, only limited steps were taken in this direction. Now a four-stage plan of five years (1993-97) has been envisaged to liberalise interest rates and ease financial market regulations. Even at present after 15 years of liberalisation, 60 per cent of deposits at banks and almost 40 per cent of deposits at non-banks are still subject to regulation. While most lending rates have been deregulated, "some elements of the old credit allocation system will remain at the end of the liberalisation period". Banks will be required to make 45 per cent of their loans to enterprises employing fewer than 250 people and granting of credit to the 30 largest chaebols will remain controlled to a certain extent even by 1997.

Finally, throughout the past 30 years, dependence on foreign direct investment has been limited. Instead, the government preferred sizeable commercial borrowings for some years. The present liberalisation plan provides for a gradual movement towards the abolition of controls on capital flows by 1997. However, even by then, limits on foreign ownership of equities will remain in place, though there is a promise of raising the 10 per cent limit on portfolio investment by foreigners. In general, the OECD economic survey reveals that the liberalisation plan may move faster on domestic financial deregulation than on foreign capital flows.

Thus, the Korean success story should be understood against the backdrop of a series of specific factors: prevalence of a fairly high level of educational and health standards: significant land reforms and an egalitarian income distribution pattern to begin with; base level social and economic conditions which have ensured a reasonable share for wage earners in national income despite the suppression of trade union rights for many years; the Confucian phenomenon of frugal living which asserted itself once American aid was phased out and which produced phenomenally high levels of domestic saving and investment rate; remarkable ability of policy planners to quickly adapt their policies to rapidly changing circumstances; an indigenously oriented industrial class which supported dictatorships and which in turn helped the industrial class to achieve two objectives: to keep the labouring class suppressed and also to keep at bay foreign capital; the policy of export promotion but supported by intense import substitution goals; less dependence on foreign direct investment (FDI) and more on foreign commercial borrowing when it was needed; and the extreme care exercised in financial sector liberalisation with the goals of retaining some controls on interest rates and directed credit even after 1997.

US Abuse of UN in Gulf War

Nasir Khan

The most powerful western countries, led by the US, manipulated the UN to bring about a war which could have been avoided. The option of a peaceful settlement of a regional conflict was not allowed.

AS the tempestuous era of the cold war dissipated, the prospects for an active role for the UN in maintaining international peace under a changed political climate in international arena were shattered by one of the most one-sided wars in the 20th century. The Gulf war was acclaimed as a great victory by the US, signalling the end of bipolarity in world order and thus safely ushering the unipolar world in the fold of 'New World Order'. But what happened was that world's most powerful states under the command of the US used the cover of the UN to unleash a war and destroy a third world country whose ruler failed to appreciate the vitality of the US interests in the Gulf region. The hi-tech war also showed the destructive effectiveness of the advanced weapon systems, thus creating greater demands for the engines of death and destruction in the world around their bigger production and sale by the western arms industries, more profits and revenues for the multinationals and greater danger to peace and international security.

The maximum destruction of the infrastructure of Iraq and massive annihilation of Iraqis was accomplished by the western allies in the shortest possible time. During this war as we all have witnessed the UN was utterly reduced to the role of a passive spectator for having abdicated its responsibilities and powers in conflict situation to the US and its western allies.

There are a number of interrelated questions around the Gulf War. The central issue remains the foreign policy goals of the US both at the regional and global levels. How the US turned to the UN in dealing with a regional conflict and managed to turn it into an instrument to further its militaristic and political objectives. And why did the UN, instead of preventing the war become instrumental of the US-led allied war designs? Were there any options to the war? Were these options for a peaceful settlement of Iraqi-Kuwaiti conflict tried before resorting to a disproportionate war of mass destruction? Could the war have been prevented? Was the UN Charter used "to save the succeeding generations from war" and "to maintain international peace and security" or was it virtually manipulated by the US? Should the global interests of the only superpower and its close allies have been accepted by the world community as the decisive factor for the UN role in the changed, non-bipolar world? What lessons can be drawn for collective security arrangements and the maintenance of international peace? How can a repetition of the violations of the UN Charter as in the Gulf crisis be safeguarded against? Does the UN Charter need reforms to accommodate new geopolitical changes in a non bipolar world? And what will be the role of the only superpower in the UN in present and future conflicts where the US interests, as perceived by Washington, are threatened? Where do the poor and weak countries of the third world stand *vis a vis* the powerful western nations and their 'new world order'? As I see it, all these questions can be analysed and interpreted in the light of the Gulf war.

For the present, however, I focus only on one main question: the role of the UN in the Gulf crisis and war (from the beginning of August 1990 to the end of February 1991). My objective to present a critique of the UN in this war is not to denigrate the world organisation, but rather to emphasise the relevance and importance of the only global organisation which can safeguard world peace in conflict areas, and also safeguard the interests of the small nations and the third world countries based on justice and even-handedness in political and economic spheres of international relations.

An assessment of the role of the UN in the Gulf War is therefore essential. Contrary to the views of the western victors and the euphoria surrounding the decimation of a third world country, the Gulf war in my evaluation was a big tragedy. But this will appear to be so only when we see things from a human perspective and take into account large scale killing and maiming of hundreds of thousands of Iraqis, sufferings of millions, destruction of Iraq, violation of the UN Charter and international peace, the geopolitical consequences for the region, and effects on the economies of the poor third world countries, etc. But for the US and its western allies, it has been called a great victory. 'This is a victory for the United Nations, for all mankind, for the rule of law, and for what is right' (speech by president Bush announcing the cease-fire on February 27, 1991).

The abuse of the UN in the Gulf war, as a concrete example, also highlights the dangers of the hegemonistic 'new world order'. At present scores of regional wars, nationalistic and ethnic conflicts are aflame in Europe, Asia, Africa and Latin America. These are taking a heavy toll on human life, causing inhuman brutalities, sufferings and destruction. Amidst all this, the UN faces enormous challenges in peacekeeping and peacemaking operations. The lessons embedded in the Gulf war also suggest that a series of diplomatic initiatives can be instrumental in enhancing the effectiveness of the UN for a more peaceful and just international security system. The World community can take steps not to let the repetition of the mistakes of the Gulf War.

INVASION OF KUWAIT AND THE RESPONSE

The events leading to the Iraqi invasion of Kuwait need to be placed in their proper geopolitical context. Iraq made claims to disputed border regions and the islands that blocked her exit to the Gulf. Kuwait had begun the billion dollar oil extractions from Rumaila (the Iraqi oil field that extends into disputed border area) when Iraq-Iran war was going on. Iraq sought compensation for the lost revenues. Iraq on behalf of the other Arab states and oil producers objected to Kuwait's overproduction of oil, which had broken OPEC agreements. The real price of oil had declined which left Iraqi economy and the task of reconstruction after the end of war with Iran in dire straits [see also Heradstveit 1992: pp 266-68]. The Iraqi intentions and threats of the use of force were not a closed secret. In a broadcast to the region on July 17, president Saddam Hussain told the Kuwaities that if they did not back down there was going to be trouble. To back up his demands, the Iraqi president ordered the troops build-up along the border as a clear signal to a possible invasion of Kuwait.

These developments and the fast deteriorating situation along the Iraqi-Kuwaiti border had not gone unnoticed. During this period, the UN personnel in the region had seen the Iraqi military build-up on the Kuwaiti border. The UN could have taken the Iraqi posturing seriously and used the preventive measures against the possible aggression. There is provision for coping with the emergency or potentially dangerous situations. Article 39 of the UN Charter states that "The Security Council shall determine the existence of any threat to peace..." and under Article 99 the Secretary-General has the option to call the Security

Council together to consider any matter which in his opinion may threaten the maintenance of international peace and security The Security Council did meet twice in July to consider other matters, but not the Iraqi-Kuwaiti dispute [see also Munthe Kaas 1991 pp 5 6] Despite his good intentions, the Secretary-General did not take any action either

The aims of Saddam could have been frustrated before his invasion of Kuwait Why was it allowed to happen? There were serious underlying political and military causes which were not addressed by the UN and the US in the region the region described by former national security adviser Zbigniew Brzezinski (1991 p 18) as "unambiguously an American sphere of influence Conventional diplomatic practices and military policies completely failed to deter Iraqi aggression, 'Hussain could never have invaded Kuwait in 1990 if his aggression had not been preceded by many years of unnecessary militarisation of the region and a failure on the part of the United States and others to conduct even handed multilateral diplomacy to settle long standing political and economic grievances there Unilateralist US policies in the 1980s and contempt for international law throughout the Reagan and Bush administrations also facilitated Hussain s aggression by creating an international political environment that seemed to condone the use of force by more powerful states In particular Washington adhered to a double standard—tolerating aggression committed by the United States and its allies but opposing aggression committed by its adversaries This had the effect of weakening the normative constraints against the use of military force' [Johansen 1991, pp 561 62]

But the Security Council was quick to respond to Iraq s August 2 invasion of Kuwait It passed Resolution 660 later that day condemning the invasion and demanding an Iraqi withdrawal It called upon 'Iraq and Kuwait to begin immediately intensive negotiations for the resolution of their differences" and supported "all efforts in this regard and especially those of the League of Arab States Now we find an unprecedented flurry of activity in the Security Council Within the next three months, 10 more resolutions were passed against Iraq On August 6, the Security Council passed Resolution 661, which imposed severe economic sanctions against Iraq The vote was 13-2 This Resolution was a comprehensive document which could have crippled the Iraqi economy and the resources

But only two days later, on August 8, president Bush delivered his televised speech deciding to send US forces to Saudi Arabia, as a launching pad for war against Iraq It is almost unbelievable that the Bush administration which had begun to run the whole show of the Security Council in the Gulf crisis had already set its eyes on the military solution instead of letting the economic sanctions work In pursuance of the American designs, the Security Council passed Resolution 665, on August 25, which authorised the use of naval forces to enforce the UN embargo In the final part, it also requested the states concerned to co ordinate their actions in pursuit of this resolution using all appropriate mechanisms of the Military Staff Committee and after consultation with the Secretary General to submit reports to the Security Council and its committee established under Resolution 661 (1990) to facilitate the monitoring of the implementation of this resolution " This resolution was widely interpreted as allowing for the use of the military force to stop and search the shipments to and out of Iraq But such military measures were in contravention of the procedures for action with respect to threats to the peace, breaches of the peace and acts of aggression as set out in the UN Charter's Chapter VII

Now we come to Resolution 678 which was passed on November 29, authorising the use of force In parts, it reads "[The Security Council] Mindful of its duties and responsibilities under the Charter of the UN for the maintenance and preservation of international peace and security authorises the countries allied with Kuwait unless Iraq on or before 15 January 1991 fully implements the foregoing resolutions, to use all necessary means to uphold and implement the Security Council resolution 660 (1990) and all subsequent relevant resolutions and to restore international peace and security in the area This virtually amounted to giving Washington permission to declare war against Iraq after the deadline But before we examine the implications of this resolution let us see how the UN found its influence totally neutralised by the US before the January 15 deadline, and then becoming a helpless spectator of events during and after the war

UN as a Political Instrument

If we keep in view the US record in the UN we find that the US had caused maximum obstructions in the functioning of the UN over the long cold war period But now suddenly, the US had a change of heart and it turned to the UN because it could be instrumental in advancing its global interests and objectives I do not, for one moment, condone the Iraqi aggression against Kuwait and the brutal oppression of the Kuwaiti people But the point I want to raise is why was Iraq specially chosen for punishment in the name of high principles? The facts behind the rhetorical stance of the Bush administration, however, present a different picture

One reason is to be sought in the fact that bipolar world order has come to an end, and that it leaves the US as the only undisputed superpower in the world This fact the US demonstrated clearly to the world community in the Gulf conflict and war The US domination in the international arena was due to its unique position in the new world order and accordingly it was beyond any question that the US military might, diplomatic gear and propaganda machinery would write the agenda and timetable in this conflict and finally deliver death-blows to a third world country which had interfered with the US interests in the Gulf area So far as the third world countries are concerned, their influence and voices were utterly neutralised in the UN by the US, while most of the western governments followed Washington's policy The former Canadian ambassador to the UN Stephen Lewis (1992, p 540) said in an interview about the enormous power of the US in the UN in these words

I don't think even readers of your journal [i e, *World Policy Journal*] can fully appreciate that when the United States wants something, sets its sights on getting it, and unleashes the full force of its remarkable range of influence persuasion, veiled coercion, promises, and expectations, it can get what it wants And that s what happened in the Gulf War And I think it's heartbreaking that the United Nations should be conscripted into the role of providing cover for US foreign policy '

Despite the mandate from the UN, which specified very exacting and far-reaching sanctions against Iraq, it was clear from the very beginning of the Gulf crisis that the US was in the commanding position to dictate its terms for legitimising its objectives in the Security Council and thereafter pursue the war aims without any hindrance from any quarter

The unprecedented response to Iraqi occupation as compared to other acts of aggression in the recent history is incisively put by the American philosopher and human rights activist Noam Chomsky (1991, p 19)

> The UN was able to respond to Iraq's aggression because, for once, the US happened to be opposed to criminal acts, as distinct from its own invasion of Panama in the first post-Cold War act of aggression, the Turkish invasion and virtual annexation of northern Cyprus, Israel's invasion of Lebanon and annexation of the Golan Heights (sanctions vetoed by the US), the Moroccan invasion of the Sahara justified on the ground that "one Kuwait in the Arab world is enough", it is unjust for such vast resources in the hands of a tiny population, and much else As for the unprecedented severity of the UN sanctions, that was a direct result

of intense US pressures, cajolery and threats, and the considerations of the self-interest that motivate other powers, great and small

Every political observer knows how the peace-keeping efforts of the UN in the cold war have been frustrated by the US But the western propaganda and controlled media attributed the ineffectiveness of the UN to the Soviet obstructionism and the 'shrill, anti-western rhetoric' of the third world The fact is that in the past 22 years, the US is by far in the lead in vetoeing the Security Council resolutions and voting against General Assembly Resolutions, on aggression, observance of international law, terrorism, human rights violations, disarmament and so on The second place goes to Britain, the close ally with 'special relationship', France is a distant third and the former USSR is fourth In the first post-cold war UN session (1989-90), three Security Council resolutions were vetoed, all by the US Two of these condemned US invasion against Panama and the third condemned Israeli human rights abuses a similar resolution was vetoed by the US the following May In the General Assembly the pattern of vetoing by the US (along with Israel and Britain) has been the same

Economic Sanctions and UN

The economic sanctions against Iraq were the toughest the world organisation had ever imposed on any country We need not give the reasons for these exceptionally stringent measures here but rather confine ourselves to one question only Why were the UN sanctions, which needed a reasonable period of time to be effective, were not given a chance?

In general, we might agree that the sanctions imposed by the UN previously, as in the case of South Africa and Rhodesia, had not been an unqualified success But the problem did not lie with the sanctions but with their implementation These sanctions proved ineffective because some western powers helped the racist regimes by secret and not-so-secret means Iraq, was, however in a different situation To draw any analogous conclusion in the case of Iraq was untenable rhetoric There was overwhelming evidence to support the view that Iraq could not have withstood the pressure of economic sanctions for long

The standard argument offered by the advocates of the use of force was that there was no guarantee that sanctions would work But as Noam Chomsky pertinently comments, "That is quite true, there is no guarantee that the sun will rise tomorrow There is, however, a strong probability that in this case the sanctions could have been effective, if only because of their extraordinary severity, and because, for once, the usual sanctions busters (the US, Britain and their allies) happened to be on board a simple truth that plainly could not be expressed" (1991, p 17)

So far Iraq is concerned, it was specially vulnerable to sanctions Oil was the backbone of Iraqi economy It earned 95 per cent of its foreign exchange through oil export and 80 per cent of its food was exported The sanctions could have squeezed Iraq badly because of the participation of its Arab neighbours, Iran and Turkey As the Iraqi foreign assets amounting to $ 4 billion were frozen, Iraq would not have been able to pay any possible sanctions bursting country, if that was possible at all Besides, any sanctions bursting country would have been faced with that multinational navies guarding the entrances and exits to and from Iraq The effectiveness of sanctions would have meant that that Iraq incurred the loss of some $ 80 million a day in oil revenue [see also Thakur 1991, p 5]

But what happened instead? The Security Council rushed to mandate a war totally ignoring the sanctions process No time was allowed to the sanctions to work No assessment whatsoever of the effectivenes (or otherwise) of sanctions was made by the Security Council The US and Britain the advocates of allowing more time for the sanctions to exert pressure in the case of the apartheid South Africa were most reluctant to follow or allow the sanctions approach in the case of Iraq Even in the US Congress nearly the majority of representatives and senators favoured sanctions instead of the war There was every evidence that the sanctions were having a real bite

The UN Security Council Resolution 678 was passed in November 1990 And within a few days on December 5 1990 the Bush administration s top intelligence official, CIA director William Webster, not a critic of the US policy, testified before the House Armed Services Committee about the effectiveness of economic sanctions The whole testimony needs to be read in its entirety because it presents an exhaustive report on the effect of the sanctions within a very short space of time A few excerpts from it as under

> Coupled with the US government's increased ability to detect and follow up on attempts to circumvent the blockade, the sanctions have all but shut off Iraq's exports and reduced imports to less than 10 per cent of their pre invasion level
>
> All sectors of the Iraqi economy are feeling the pinch of sanctions and many industries have largely shut down Most importantly, the blockade has eliminated any hope Baghdad had of cashing in on higher oil prices or its seizure of Kuwaiti oil fields
>
> The blockade and embargo have worked more effectively than Saddam probably expected More than 90 per cent of imports and 97 per cent of exports have been shut off Although there is smuggling across Iraq's borders it is extremely small relative to Iraq s pre crisis trade
>
> The cut off of Iraq s oil exports and the success of sanctions have also choked off Baghdad s financial resources This, too, has been more effective and more complete than Saddam probably expected In fact, we believe that a lack of foreign exchange will, in time be Iraq s greatest economic difficulty
>
> The embargo has deprived Baghdad of roughly 1 5 billion dollars of foreign exchange earnings monthly At current rate of depletion [of foreign exchange reserves], we estimate Iraq will have nearly depleted its available foreign exchange reserves by next spring [*The Middle East Congressional Quarterly* 1991 pp 380 81]

The US Congress in its debate which began on January 10 1991, to consider a resolution whether president Bush should be authorised to start war against Iraq, focused on the question of the effectiveness of the sanctions and embargo The advocates of war had their doubts that sanctions could force Iraq out of Kuwait within the short space of time Another argument advanced was that the multinational coalition would not hold for months or years because it was composed of countries with divergent interests There was also the likely dangers to the friendly Arab regimes from internal unrest and popular uprisings of their populations It was therefore necessary to resort to a decisive military solution This argument in fact is an admission of the sort of support the US had from its allies in the region

The advocates of sanctions accepted that even if sanctions ultimately failed to bring Saddam Hussain down or force him out of Kuwait, it was wise to give sanctions more time because these were weakening and demoralising the Iraqi army every passing day The argument of the advocates of war was that delaying the military option in favour of sanctions would be used by the Iraqi forces to fortify their position in Kuwait Against this standard argument, the remarks by senate majority leader John Mitchel at the beginning of the debate deserve to be cited "Time to fortify Iraq s defences will do little good if some of Iraq s planes can't fly for lack of spare parts if some of its tanks can t move for lack of lubricants, if its infrastructure and ability to wage war have been weakened If it eventually becomes necessary for the US to wage war our troops will have benefited from the additional time given the sanctions to degrade Iraq s military capabilities" (*The Middle East, Congressional Quarterly*, 1991, p 335)

It is a fact that even before the war began president Saddam Hussain was forced to stop training the air force cut down reconnaissance flights due to maintenance problems and the shortage of refined jet fuel There was a large measure of agreement in

the US military leadership that sanctions should be given more time to work. It is reported that when General Colin Powel advocated a delay in launching the war and more time to sanctions to be effective, president Bush replied: "I don't think there's time politically for that strategy" [Bob Woodward cited by Evan Thomas, *Newsweek*, May 13, 1991, p 19].

Most of the peace-research studies carried on in the last two years have shown that if sanctions had been allowed time, a beleaguered Iraq did not stand a chance of withstanding the international pressures for the evacuation of Kuwait. This situation would have given a breathing space for urgent behind-the-scenes diplomacy. Many countries, like France, Algeria, Tunisia and Iran were really involved for peaceful diplomatic solution. By various means any reference to find a diplomatic solution by the Arab states was pushed aside by the US. The efforts of King Hussain of Jordan and Yasser Arafat for a peaceful solution were misrepresented by the US as helping Iraqi regime. In fact, Chapter VIII of the UN Charter explicitly provides for "using regional arrangements or agencies" in disputes and violations of peace and security. Article 53(3) enjoins the Security Council to "encourage the development of pacific settlement of local disputes through such local arrangements or by such regional agencies". The Arab community, however, was not given enough opportunity to resolve this conflict. The carrot-and-stick policy of the US paid off. Saudi Arabia and Egypt sabotaged any Arab solution to the conflict.

Violations of UN Charter

But by agreeing to January 15 deadline, the Security Council virtually pre-empted any such peaceful diplomatic solution. The Security Council by its Resolution 678 on November 29, in fact, ignored the procedures of the UN Charter. The Security Council did not wait to see the results of the implementation of Resolution 661. Instead, it was rushed into authorising a war led by a command structure outside the UN. The Security Council had no say, no control and no influence in starting the war, its prosecution or its ending. The US was given a green light to proceed as it chose to do.

This has been the most serious violation of UN Charter in its history. And this breach cannot be justified or defended on any reasonable grounds, whatsoever, whether legal, moral or political. Harald Munthe-Kaas (1991), rightly says that "you cannot allow selective usage of international laws and regulations to suit specific purposes at different times by different nations and still retain the authority of the Charter as the "magna carta of peace and security for mankind" as it was portrayed by US Congress 45 years ago. If that is so then the UN Charter can be used to legitimise just about anything a nation wants to do.

Stephen Lewis (1992, p 539) comments on the role of the UN thus:

> In my view, the United Nations served as an imprimatur of legitimacy for a policy that the United States wanted to follow and either persuaded or coerced everyone else to support. The Security Council thus played fast and loose with the provisions of the UN Charter. For instance, sanctions were invoked under Article 41, but there was never any assessment of whether those sanctions were working or might work sufficiently before the decision was made to resort to force under Article 42... The Charter did not envision that the United Nations would function as a vehicle for a superpower like the United States or a coalition—US-led—to make foreign policy decisions. Nor did it envision that such a coalition would assume all authority for the implementation of those decisions. I cannot believe that the people who got together in San Francisco in 1945 intended that sort of inconsequential role for the United Nations—a role that sees the United Nations as a rubber stamp, as an organisation that is manipulated on behalf of the foreign policy interests and priorities of a few very powerful states (1992, p 539).

Under the undue pressure of the US, the UN endorsed the use of military means which the Bush administration used for unleashing the genocidal and destructive war.

The UN Security Council violated the UN Charter on several counts. But apart from these substantive and formal violations, we find that the intent of the Charter was totally ignored. For example, under Article 33 of the UN Charter, the states are under an obligation to seek a negotiated settlement to any dispute which can endanger the maintenance of international peace and security. The Security Council in such a situation will call upon the parties to settle their conflict by such means as negotiation, inquiry, mediation, conciliation, arbitration, judicial settlement, resort to regional agencies, or other peaceful means which the parties may choose. In an international conflict of such magnitude such as Iraqi invasion of Kuwait, blocking the way to finding a peaceful solution virtually meant putting the lives and well-being of many millions of innocent people at the mercy of a murderous war machine of the US and Britain.

The UN Charter, Chapter VII deals with the situations where threats to the peace, breaches of peace and acts of aggression are concerned. The objective as stipulated in Article 39 is to determine "what measures shall be taken in accordance with Articles 41 and 42 to maintain or restore international peace and security".

A full citation of these articles is essential for our understanding the mandatory actions of the UN in conflict situations:

> Article 41: The Security Council may decide what measures not involving the use of force are to be employed to give effect to its decisions, and it may call upon the Members of the United Nations to apply such measures. These may include complete or partial interruption of economic relations and of rail, sea, air, postal, telegraphic, radio and other means of communication, and the severance of diplomatic relations.
>
> Article 42: Should the Security Council consider that measures provided for in Article 41 would be inadequate or have proved to be inadequate, it may take such action by air, sea or land forces as may be necessary to maintain or restore international peace and security. Such action may include demonstrations, blockade or other operations by air, sea or land forces of the Members of the United Nations.

As mentioned earlier, the Security Council did not give the sanctions any reasonable time to be effective as stipulated under Article 41 of the UN Charter. Within three months of the imposition of sanctions, and without making any assessment of their impact, the Security Council was pushed and rushed into passing the Resolution 678 on November 29 setting the January 15 deadline for military action by the US and its allies. In this way, other peaceful options in resolving the conflict were thrown away. The full implementation of the earlier resolutions came to nothing. On all these counts, there was violation of UN Charter and the underlying principles of the UN *raison d'etre*. And war was accorded legitimacy in vague and general terms which suited the needs of the US and its allies.

Legality of Resolution 678

The legal validity of this resolution is also doubtful. It is stipulated under Article 27 (3) that "decisions of the Security Council on all other matters shall be made by an affirmative vote of seven members including the concurring votes of the permanent members". China had abstained from voting on the resolution and obviously this abstention was not a concurring vote of a permanent member. However, any analogy with China's abstention in the case of Korea in the early 1950s is a very shaky and tenuous precedent, whose details are not needed for our present analysis [for details, see Falk 1992, p 179]. The conclusion in legal terms is that Resolution 678 by setting the January 15 deadline for military action violated both the Articles 41 and 42. It also violated the Security Council vote regulating Article 27 of the UN Charter.

Now we turn to the substantive aspects of the Resolution 678. Article 46 of the UN

Charter states that "Plans for the application of armed force shall be made by the Security Council with the assistance of the Military Staff Committee" How and under whose direction and control will the Military Staff Committee initiate military action, that is, the minimum use of force to implement the US resolutions (and not to wipe out or destroy the target country)? This is made explicitly clear under Article 47(3) which says that "The military staff committee shall be responsible under the Security Council for the strategic direction of any armed forces placed at the disposal of the Security Council" The action of the US led allies totally ignored every semblance of legality which Resolution 678 was capable of It is true that the military staff committee to be composed of the chiefs of staff from the permanent members of the Security Council, had not met since 1945, only the low level staff held weekly meetings But all the initiatives by the former USSR to revive and revitalise the military staff committee were refused by the US At a critical situation such as the authorisation of the force in the Gulf, the Security Council should have taken steps to assemble the military staff committee Nothing of the sort was tried But it is doubtful if the US would have allowed it to succeed because Washington was determined to have a free hand to crush Iraq as a regional power

Under intense US pressure manipulation and carrot and stick diplomacy the US had its way in the Security Council Former US attorney general Ramsey Clark describes how president Bush coerced and bribed the UN Security Council in pursuance of his war plans "To secure votes the US paid multi-billion dollar bribes offered arms for regional wars, threatened and carried out economic retaliation forgave multi-billion dollar loans (including a $ 7 billion loan to Egypt for arms) offered diplomatic relations despite human rights violations and in other ways corruptly exacted votes, creating the appearance of near universal international approval of US policies toward Iraq A country which opposed the US, as Yemen did lost millions of dollars in aid, as promised, the costliest vote it ever cast" [*War Crimes* 1992, p 13]

The question of the legality of the UN resolutions embargoing Iraq and supposedly authorising the use of force is highly suspect The whole show was stage-managed and run by the Bush administration in the Security Council In his impeachment resolution against president Bush for high crimes and misdemeanours in the house of representatives, which is printed in full in the *Congressional Record* [H Res 86, February 21, 1991], the representative Henry B Gonzalez, mentioned "bribing, intimidating and threatening of others, including the members of the UN Security Council" Gonzalez cited the following outright bribes

> Immediately after the November 29 vote in the UN authorising force the administration unblocked a $ 140 million loan for the World Bank to China and agreed to meet with Chinese government officials The Soviet Union was promised $ 7 billion in aid from various countries and shipments of food from the United States Zaire was promised forgiveness of a part of its debt as well as military assistance A $ 7 billion loan to Egypt was forgiven a loan the President had no authority to forgive under US law Syria was promised that there would be no interference in its Lebanon actions Saudi Arabia was promised $ 12 billion in arms sales The administration attempted to coerce Yemen by threatening the cut off of US funds The US which owes the most money to the UN, paid off 187 million dollars of its debt immediately after the vote authorising the use of force [*Congressional Record* January 16 1991 H520 cited in *War Crimes* 1992 p 42]

Abdicating Responsibility?

Even though the Security Council had authorised military action there was no clear mandate "After pronouncing its blessing on the military force—the blank check of the Gulf War—the Security Council and the Secretary General merely watched from the sidelines as the United States did what it wanted without accountability to the Council" [Johansen 1991, pp 563-64] As a result Washington was free to destroy the Iraqi army and the fleeing soldiers in many hundreds of thousands The UN mandate under which the allies operated was to drive Iraq from Kuwait There was no mandate, as far as I can see, to commit massacre on this scale The destruction of economic infrastructure was systematically and wilfully carried out to bring Iraq in the 'pre-industrial age'

Under-Secretary General of the UN, Martti Ahtissari submitted his report to the Secretary General on March 20 1991 on the post war situation in Iraq In the report he writes

> It should however be said at once that nothing that we had read had quite prepared us for the particular form of devastation which has now befallen the country The recent conflict has wrought near apocalyptic results upon the economic infrastructure of what had been, until January 1991, a rather highly urbanised and mechanised society Now most means of modern life support have been destroyed or rendered tenuous Iraq has, for some time to come, been relegated to a pre industrial age but with all the disabilities of post-industrial dependency on an intensive use of energy and technology [*War Crimes* 1991, pp 237 38]

The UN abdicated its responsibility in handling the conflict It exercised no control over the application of Resolution 678 No clear objectives of the war or the means of its execution were laid down How long will the hostilities last? Who will have the command of the allied forces, the UN or the US were not made clear The US-led coalition forces by no possible stretch of imagination could be called the UN forces Everyone within the corridors of the UN and outside knew about it These were not UN forces These were totally under the command control and direction of the US The man in charge of the military operations the Desert Storm' was General Schwarzkopf who was accountable to his boss president Bush and not to any organ or official of the UN And president Bush was not accountable to the UN for the actual conduct of war or for his war aims

Despite clear violations of the UN constitutional structure there was silence within the organisation and the press to discuss the problems and the course of events Richard A Falk of Princeton University rightly say "Silence on this matter indicated how complete the US control over the use of UN machinery had been since August [1990] Even the two states that voted against Resolution 678 Yemen and Cuba failed to raise any constitutional objection to this way of proceeding Overlooking the constitutional framework of the United Nations compromised the independence and future of the organisation It was neither healthy nor politically acceptable for the United Nations to become the creature of the only remaining superpower in the world, especially in the area of peace and security" [Falk 1992 p 179]

The hijacking of the UN and the total perversion of its procedure and mandate by the US administration is a sad chapter in the history of the world body Here for the first time in the post cold war period the principle that military might is the rule of the New World Order was brought home to the world Secretary General Javier Perez de Cueller declared in these circumstances that "this is a US war, not a UN war and 'the Security Council is controlled by the United States Britain and France In an article Consider These White Lies And The Truths They Veil the conservative American columnist William Safire wrote

> This is not a UN enforcement action that part of the UN Charter has never been invoked Instead this is a collective defence authorised by the Security Council similar to the Korea in defence which means that the resolutions cannot be revoked without American concurrence America shows obedience to the UN but obedience is a white lie The fighting coalition determines [*International Herald Tribune* February 26, 1991]

In case of military operation and that *only* as a last resort after having exhausted other

options should the UN Security Council have conducted the military operation under its name The UN troops should have had the UN flag under a UN military command and control The UN Secretary General Javier Perez de Cueller after the end of the war acknowledged the lack of authority which the UN experienced and the way Resolution 678 was implemented In a speech at the University of Bordeaux on April 22 1991 he said 'The Security Council needs to preserve for itself the authority to exercise guidance supervision or control with respect to the carrying out of actions authorised by it It was clearly a criticism of the US usurpation of the UN authority He added "It is important that this special power [the veto power of the five permanent members] is exercised in such a manner as to avoid imbalances in the international community as well as in the United Nations

To put the matter in very precise and concrete terms this war was not the United Nations war Richard Falk is absolutely correct to point out that the authorisation to unleash the Gulf War rested on an extremely weak foundation Recourse to war demonstrated the weakness of the United Nations in relation to its own charter far more than it added to the US claim that its policies were a justifiable solution to the Gulf crisis Because the United Nations gave its blessings to the war does not mean this course action was legitimate (1992 p 179)

This fact the UN Secretary General Perez de Cueller candidly admitted after the war in a speech to the European parliament in Strasbourg on April 16 1991 where he declared The victory of the allied or coalition countries over Iraq is not at all a victory for the United Nations because this war was not its war It was not a United Nations war General Schwartzkopf was not wearing a blue helmet He elaborated that for a war to be legitimate and just nowadays it has to be authorised and regulated by the provisions of the UN Charter This sort of war had to be initiated only as a last resort and decided upon by the world community as represented by the Security Council He added 'The establishment of a new world order about which so much has been said will have to take place within the framework of the United Nations but of a United Nations that does not resort to double standards—a United Nations whose impartiality ensures its credibility [cited from Munthe Kaas, 1991 p 7]

The former Secretary General a cautious and peaceful person, no doubt could have asserted his authority and intervened to prevent the transgressions against the functioning of the Security Council But his speeches and comments after the end of war have revealed conclusively the extent of the power and influence the US exercised in the United Nations

The aim of the UN Charter was to "maintain international peace and security" and "to save the succeeding generations from war But the most powerful western countries led by the US totally manipulated the UN for a war which could have been avoided The options to a peaceful settlement of a regional conflict were not allowed A regional conflict was transformed into a global conflict by the US Contrary to the views of the western victors and the euphoria surrounding the destruction of a third world country the Gulf War in my evaluation was an act of genocide and inhuman barbarity President Bush announcing the cease fire on February 27 proclaimed to the world 'This is a victory for the United Nations, for all mankind for the rule of law and for what is right This pronouncement was a total falsification of what actually had happened The destruction of a third world country killings and maiming of many thousands of defenceless civilians massacring of hundreds of thousand of fleeing soldiers burying alive in the sand thousand of defenceless soldiers violations and manipulation of UN at least does not appear to me to be the victory for the UN mankind or the rule of law

REVIEW OF

New Technologies and Emerging Structures of Global Dominance

P Purkayastha

Whereas the existing global scenario appears to offer little opportunity to countries like India to break out of the present stranglehold of technological monopoly/control by advanced countries and MNCs, the potential exists for evolving alternative technological paradigms based on contemporary advanced knowledge. In other words, the choice is not only between surrendering to a junior partner role or following an autarkic reinvent the-wheel mode. Even at the present high level of science and technology knowledge India does have the capability in terms of human and financial resources to pursue other options.

THE global dominance in technology today by a handful of countries is a determinant in structuring global relations both economically and politically. The opening of third world economies under Fund Bank aegis is providing the multinational corporations (MNCs) entry into larger and larger areas of global economy with technology playing a vital role in the process. Self reliance in today's world is not merely a noble goal but an imperative for retaining independence. In this article we will examine the role of technology in shaping relations between countries and their implications for the third world.

Quite often discussions on technology concentrate on its relation to the development process and the economy. In most such discussions technology is seen as an external factor. Some of the economic theories have attempted to come to terms with technology by incorporating it as an integral part of the economy rather than an exogenous factor. The discussions however have been more on the economic implications of technology rather than focusing on technology itself with its own inner dynamics. We feel purely for the purpose of abstraction it is important to concentrate on technological issues particularly with respect to the potential of third world countries like India to emerge from the current relations of dependence. This does not imply that any technological development will automatically translate into economic development but rather to point out the necessary conditions for development without in any way implying that they are sufficient conditions as well.

As stated earlier there is a need to abstract out the domain of technological discourse from that of the economic one. An adverse balance of payments may imply technological dependence but it also may not. One has only to look at the largest debtor nation—the US—to realise that a one to one correspondence of economic issues with technological ones is fraught with certain dangers. The US is running the largest deficit economy in the world with a huge adverse balance of payments while it is also leading the world technologically. Certain oil economies are surplus in trade terms but completely dependent technologically. A buoyant economy does not necessarily imply a technologically healthy one just as a sick economy does not necessarily indicate technological backwardness. In the long run technological advance should translate itself into economic advance while technological backwardness would result in economic dependence. However it is essential to establish the parameters of technological dependence in order to identify the potential for autonomous technological development.

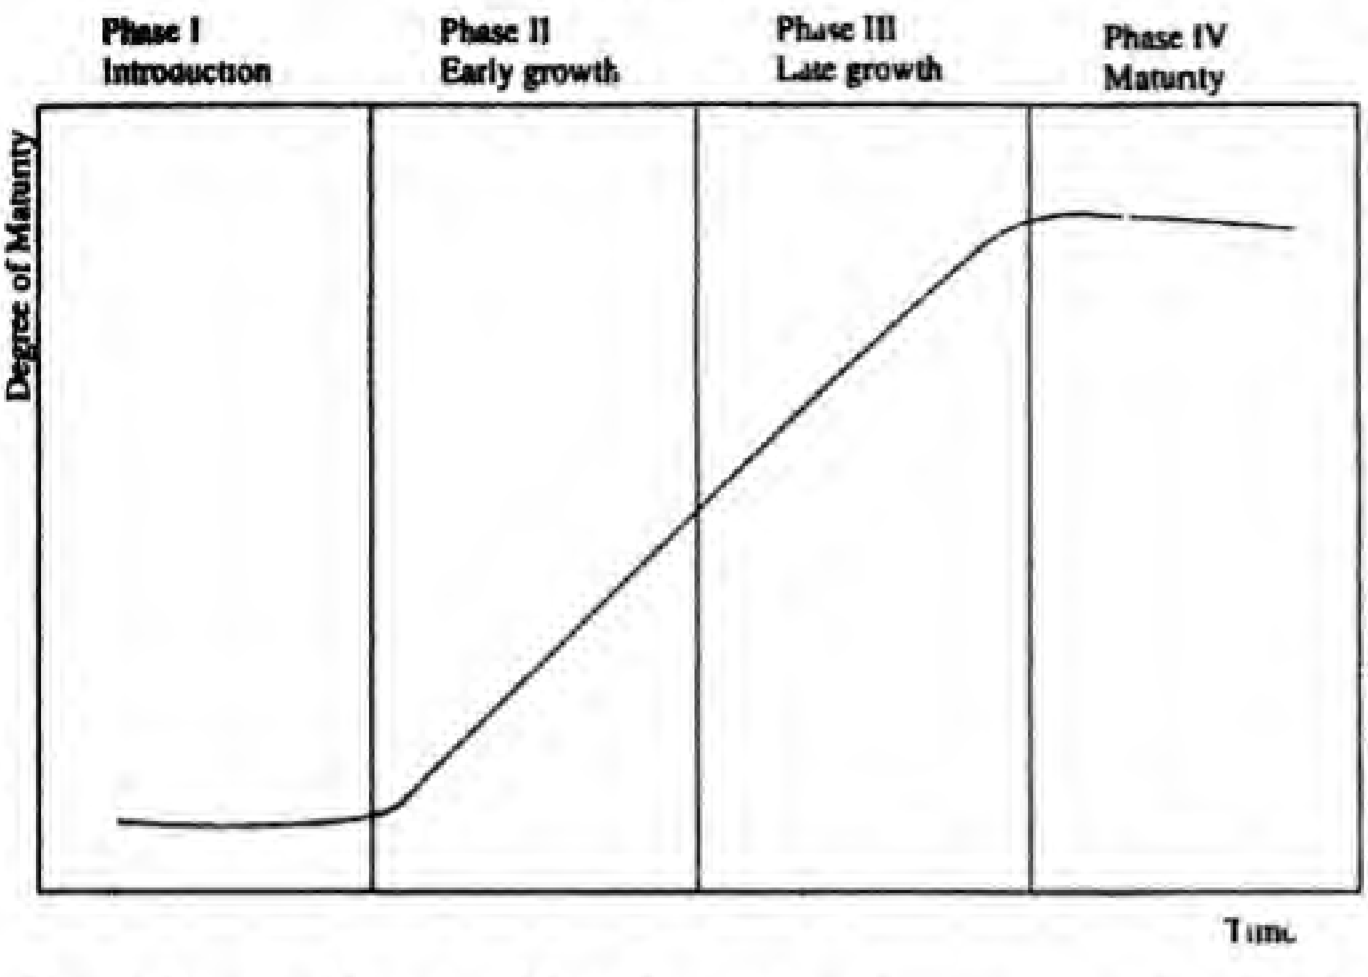
TECHNOLOGY AND DEPENDENCE

The post world war scenario had a number of new factors which were to change the nature of technological relations between nations. The newly independent nations had come on the global scene with little industrial base and a clear desire to industrialise. The emergence of a powerful socialist bloc did provide the possibility of retaining relatively more initiative with the developing countries than their technological development might have otherwise allowed. A number of them embarked on a path of industrial development with the avowed aim of self reliance even though technological expertise was largely with the advanced countries. Except for a few countries like India which had seen some industrial development earlier most of the newly independent countries had very weak technological or industrial base. In this situation western nations devised an initial strategy wherein the developing countries were to supply raw materials and agricultural commodities while the manufacturing sector would remain largely within the advanced countries. This policy was attempted to be applied by the west to India also. Technologies for steel, steam turbines, boilers and pharmaceuticals were denied by western nations/manufacturers as a part of this policy. It was only when India started negotiations with the Soviet Union and east European countries that western companies reluctantly agreed to participate in India's industrial development.

Even though the above western scheme of division of labour did soon break down for countries like India, Brazil, Korea, etc, in overall term the third world did become suppliers of largely raw materials to the west while importing manufactured goods from them. However with a number of third world countries breaking into the production of manufactured goods, the western strategy vis a vis the third world correspondingly shifted emphasis from supply of manufactured goods to supply of know-how for the manufactured goods and equipment for the capital goods sector. Even with the consumer goods sector the west was prepared to part with technology for consumer items through licences, joint ventures or through subsidiaries. However what was not transferred was the ability to produce new designs and new products. In other words the monopoly of generation of knowledge still remained within those companies who were entering into such agreements with third world entities. Here was the genesis of technological dependence which was to lead to repetitive collaborations as newer and newer products came into being. The new designs and products were used to discipline the third world partners who lacked the tools to independently develop the same.

The response of countries like India was to build a high protection barrier for the home market while actively promoting indigenisation. Though much is being written today about the failure of this strategy, and there is certainly much that could be faulted with it there is little doubt that the ability of Indian industry to produce a variety of goods and to develop crucial skills in a whole range of areas, was the result of this policy. One has only to look at neighbouring economies and the paucity there of both locally made products and local skills in the entire gamut of industrial goods to realise the significance of the earlier production system.

FIGURE 1 LIFE CYCLE OF A TECHNOLOGY



Nevertheless, even if the regime of physical and fiscal protection did lead to a large range of manufactured goods being produced indigenously or with know how from abroad, it did not really lead to the avowed national objective of self reliance In fact within the protected market monopolies developed which were quite comfortable with the system of protection and content to borrow second rate technology from the west to produce third-rate goods in India In other words, production of knowledge, crucial to the development of the next generation of technologies did not take place within such monopolies The public sector enterprises in some areas did provide suitable thrusts But they too were soon to enter into a series of agreements with MNCs in the 70s and 80s, reducing them to junior partners in the technological system This, coupled with the perception of the prevailing political culture regarding the milch cow' properties of the public sector was to see an erosion of their role in developing new technologies

The earlier policy of indigenisation was conceived within a framework of relatively simple and stable nature of production systems Technology was presumed to be rather static and changing much slower than the perceived pace of indigenisation However, the rapid growth of new technologies and changes in old ones were to belie these expectation Only in the immediate post war context was the production systems relatively stable, the picture changing drastically from the late 60s onwards Technologies of the 50s and early 60s were relatively different compared to today's technologies They were relatively mature, i e, had been developed some time back and were not subject to rapid changes Thus a scheme of indigenisation of such technologies is different from a technological scenario where continuous change is the order of the day Principles of steel making development of turbines, etc changed far slower then than the current technologies which are being driven by the micro electronic revolution If change is not so rapid indigenisation would mean the ability to increase progressively the indigenous content and reduce the imported one over a period of time bringing the indigenous content to a very high level In such a scheme import substitution is the key—once a technology is borrowed, it only needs to generate its inputs from the country itself in order for self reliance to be achieved Though, the need to associate R and D institutions with import of technology was also articulated as a part of this scheme there was very little activity on this front The twain, R and D institutions and industry rarely met, and the talk of associating R and D institutions with the industry remaining mere lip-service

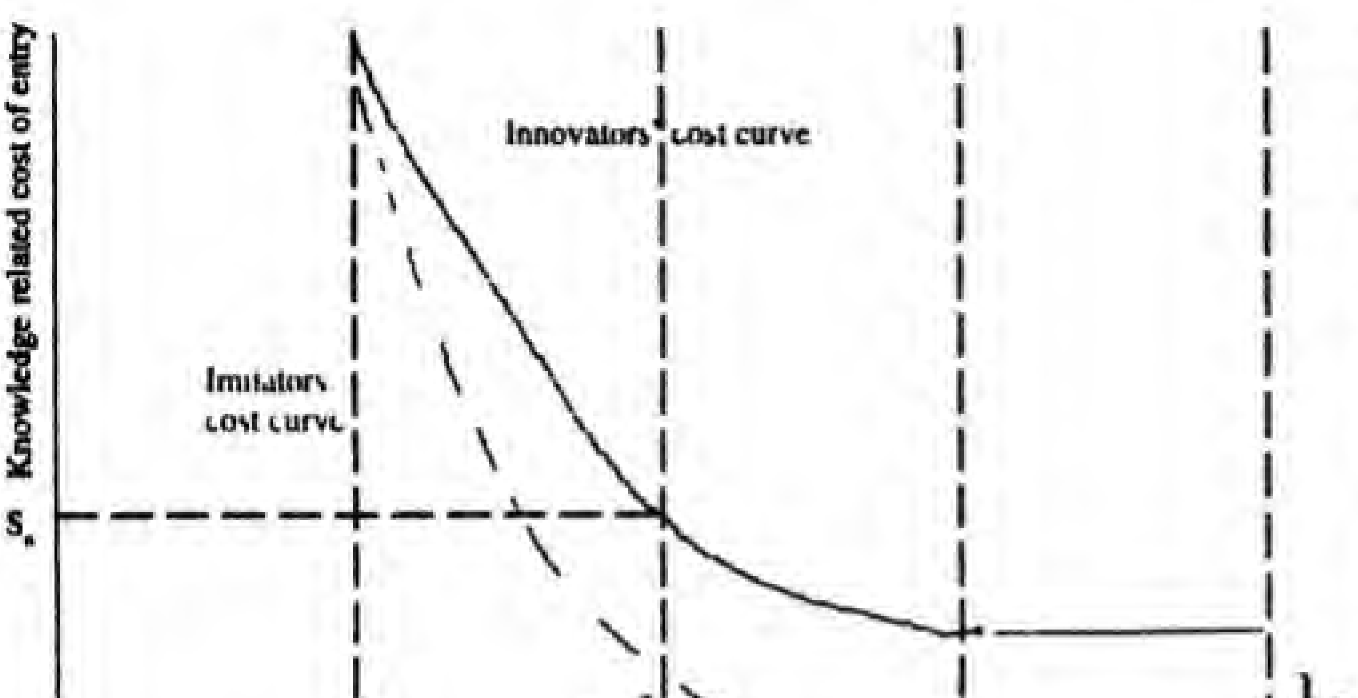
While 50s and early 60s were to see generally stable technology regimes and extension of production as the major thrust this was to radically change in the succeeding decades The development of micro electronics and cheap computing power was to introduce a new dynamism in almost all production technologies and the capital goods sector Apart from the relative speed of change of technologies in the 70s and 80s there was another major development that was taking place globally in the system of production The post 60s period was to see an increasing degree of complexity of the system of production The ability to incorporate 'intelligence in the products was also to see the development of a whole range of new industrial and consumer products Earlier it was relatively simple to estimate a country's development—it was strongly correlated to the amount of steel and energy being used by a given economy However with the growth of the information sector in advanced countries which today is of the order of 25 per cent of their economy, such correlations do not work anymore Further a study of a cross section of industrial and consumer products will show that the complexity of today's products is greater than for a similar range of products of the earlier period Apart from the dynamic nature of technology today it is also the complexity of both the products and the production systems that has a vital bearing on the policies for engendering self reliance

The earlier attempts at self reliance was, as already stated characterised by a highly regulated system consisting of import controls and production controls These controls were physical and required the administrative machinery to be fully knowledgeable both about the nature of the regulations and the entire range of production systems Obviously the speed with which technology was changing and the complexity of the system were also responsible for the crisis of this system The system was predicated upon a paternalistic but a knowledgeable bureaucracy which had to guide the fledgling innocents of the industry Instead, we rapidly developed a predatory bureaucracy and monopoly nexus which was to provide a barrier to growth itself under the changed context

In a situation of physical controls and capacity specifications it is difficult to make efficient use of new technologies With increasing complexity of the production system maintaining physical controls become increasingly difficult It is easy to show that if the number of products to be controlled increases physically the regime of controls will be faced with an exponential increase of workload on the system Physical controls would then simply slow down the processing of information and finally the flow of goods building in an extra time lag of a fairly high proportions Only large houses could 'short circuit this time lag by introducing large scale corruption into the system It should be noted that this time lag was also being introduced at a time when technology was in its most dynamic phase It was not unusual in the good old days when the department of electronics (DOF) reigned supreme in all matters electronics, to have DOE finally agree to the import of a computer only when it had become obsolete Obviously the regime of physical controls was generating neither self reliance nor growth

Globally the development of information technologies led to the increasing importance of knowledge intensive industries We are using the term knowledge intensive rather than science-based since the latter denotes a more deterministic chain than that existing in

FIGURE 2 VARYING KNOWLEDGE-RELATED COST OF ENTRY FOR DIFFERENT INNOVATING AND IMITATING FIRMS



practice Hitherto R and D intensive industries were largely chemicals pharmaceuticals aerospace and materials With micro electronics and information technologies, a much larger domain of R and D intensive or knowledge intensive industries have been established The chemical and pharmaceutical sectors are R and D-intensive but not necessarily knowledge intensive in the same way as information technologies are Once a product is found to have certain properties duplicating it is not difficult The importance of patent protection for this sector stems really from this specificity of the industry Micro electronics has generally been identified as the first knowledge based industry Biotechnology is the next In the 80s and now in the 90s biotechnology is poised to enter into a variety of sectors including agriculture and animal husbandry In the next section the nature of the micro electronic and biotechnology revolutions will be examined before we discuss the international division of labour which is currently taking shape under their aegis

KNOWLEDGE INTENSIVE INDUSTRIES

There is a tendency to refer to the advanced technologies as science based Such definitions tend to project the relationship between science and technology in too one-sided a way It tends to picture technology as derivative of science and therefore is an incorrect reflection of the relation between science and technology Knowledge-based technologies have been offered as a better description Nevertheless, both terms can be construed to imply that other technologies are not based on science, or knowledge[1] For these reasons we prefer the term knowledge-intensive such technologies generally also being science and R and D intensive The micro-electronics revolution brought to the fore that knowledge as a commodity could be the major cost of a product Apart from labour and capital, the two traditional factors of production knowledge or human capital is increasingly becoming important in the production process [Truman 1982]

Information technology and biotechnology have been identified as the major knowledge-intensive industries today However these are not the only R and D-intensive industries in fact traditional engineering industries are also becoming increasingly R and D intensive For instance, the Airbus Industries consortium in Europe was formed specifically to meet the soaring R and D costs which no single company was able to meet individually Knowledge intensive industries differ from such industries in only one aspect the cost of knowledge as an intangible is a large part of the cost of the commodity itself The clearest example of this is software, where the cost of the tangibles, namely, software media and manuals, are very small compared to the total cost of the software as such However, the distinction between knowledge-intensive industries and other R and D-intensive industries would require a more detailed analysis than is possible here and may, indeed, not be as sharp as made out above In the next section we describe the implications of knowledge-intensive industries for the extant international division of labour

Information technology encompasses a large domain covering electronics, computers, software, telecommunications, industrial controls, etc The micro-electronics revolution has been likened to a second industrial revolution [Rada 1982] Unlike the first micro-electronics seeks to bring into its orbit the traditional white collar occupations also which were earlier thought to be relatively immune to automation and obsolescence The last 20 years have shown conclusively that information technology is the key to future industrial development Major changes in industry as a whole which are directly linked to micro electronics are as follows

* lower plant design margins are required as temperature, pressure regimes can be controlled within a much narrower band due to superior controls
* computerised design permits optimises solutions lowering equipment costs
* better controls reduce wastage e g, in steel plants wastage comes down to 5 per cent from 20 per cent
* greater flexibility in terms of flexible manufacturing systems batch processing systems etc
* tighter link to the market through better information flows and response to the same

The consumer goods sector has also benefited enormously from embedding of intelligence in the products The ubiquitous microprocessor is now not only a part of the much advertised smart missiles but also embedded in a range of domestic equipment The electronic industry has created a whole range of consumer products which did not exist earlier or if it did, was restricted to a very small elite segment

The importance of information technology lies not only in the role it increasingly plays in industry, but in its penetration into almost all branches of industry and all spheres of creation of new knowledge Entities having an edge in this area can therefore dominate a whole range of industries Today, there is an intense competition globally to determine who sets the pace in this sector That is also why the control regulations like COCOM initially introduced to control flow of technology for the eastern block and now increasingly directed at the third world, concentrate on this area The size of the information technology market itself is also quite significant in its own right It is estimated that the size of the information

technology sector is 25 per cent of the GNP for the OECD countries. Table 1 shows the estimated size of the market in 1991.

The US and Japan dominate two important sectors of information technology. In software, the US has 60 per cent market share while in semi-conductor chip production, Japan dominates with 50 per cent the US following with 36.5 per cent.

It is also interesting to note the directions that information technologies are taking. The coming together of telecommunications and computers has forced strategic alliances in industry. Companies in computers just had to be in telecom as well, and vice versa. Similarly, chip-making companies are being increasingly incorporated as a part of thi- alliance since the already high R and D costs are roughly doubling with each successive generation of chips. The 4 Mbit DRAM chips based on 0.8 micron technology is estimated to have cost $ 2 billion to develop, a cost which has to be recovered within the estimated life-span of seven years before its obsolescence (*Micro-electronics Monitor*, September 1990). Each successive generation of such chips will require approximately double the investment while the period for recovery is expected to shrink to three years from the current seven years. Thus the 0.5 micron 16 MBit DRAM chips being introduced now has cost the companies an investment of the order of $ 4 billion, while the 0.3 micron 64 MBit DRAM chips will require an astronomical investment of $ 8 billion and is expected to be introduced by 1995, a scant three years after the introduction of the 16 MBit chips.

As a part of these strategic realignments, US corporations including IBM have now been permitted to join the $ 5 billion JESSI Project for development of sub-micron technologies. Similarly, European companies are joining SEMATECH, the US semi-conductor initiative. There is thus a global pooling of resources in hardware, certainly in the basic building block, the chip. However, these strategic alliances are being forged increasingly between MNCs breaking out of their traditional operational boundaries. It does appear that the shape of future such alliances will tend to be more global than nationally bound, even counting the EEC area as a 'nation', JESSI and SEMATECH notwithstanding. However, national initiatives will provide a major thrust to new technologies, particularly as the state will increasingly have to underwrite a major part of R and D costs.

A part of the software industry is also being drawn into the strategic alliances being formed globally. The system level software, as distinct from application software is closely tied to hardware. Software companies like Microsoft, who deal with system software are increasingly becoming a part of the strategic alliances being forged in hardware. The application software companies however, are relatively independent, producing software which is compatible to a wide range of hardware platforms, and this trend is likely to continue and even intensify.

In fact, the role of the state in this scenario is also emerging as an important factor. This is particularly visible in Europe, where different states play major roles in direct investments and institutional support to R and D programmes both nationally and increasingly in multi-nation collaborations. In Japan, the state has always played a major role in supporting and otherwise promoting R and D in clearly identified thrust areas designed to establish and maintain Japanese dominance in advanced technologies. The role of the state in the US is, as usual, less transparent but is nevertheless substantially interventionist and, increasingly in the new context, assertive in its efforts to promote US corporate interests globally. The US government are not only pushing promotional measures domestically and abroad, but are also directing punitive or control measures against current or potential rivals—this role is increasingly being witnessed particularly in the area of high technology.

The other interesting area of change is in start-up costs. The costs of starting a new chip-making venture in the early 70s, the initial period of the micro-electronic revolution was about $ 2 million [Commonwealth Working Group 1986]. By the mid-80s it had risen to $ 100 million and today stands at about $ 300-$ 400 million. Obviously companies like INTEL and Motorola could join the big league even though they started small since they entered the field when start-up costs were low. In the current scenario, entering chip-making, even with somebody else's design, will cost $ 300-$ 400 million provided, of course, the original chip manufacturer is prepared to license the chip. However, the R and D costs for new chips are extremely high and this precludes any but the really large companies (and/or large state-supported ones) from entering this area and thus perpetuates the dominance of a few players. Only South Korea has been able to break into this league and are today channelising huge funds into R and D aimed at establishing a technological base for future growth.

Paradoxically, the picture as regards software start-up costs is quite different. Due to large-scale introduction of PCs, investments required to start a software company are quite low. In software, since portability between different machines has been an important criterion, one can develop and transfer complex application software even from PCs to large machines without serious problems. With continuous drop in hardware costs, and the mutual compatibility that manufacturers increasingly provide in response to user requirements, it is possible to produce sophisticated up-market application software at relatively low costs. As already argued, the knowledge incorporated into the software is the major input and therefore physical investments are comparatively low. Even for super computers, the massively parallel computing systems have lowered the cost of hardware dramatically. The Indian supercomputer made by C-DAC cost only about Rs 15 lakh against $ 2 million for the CRAY from the US. Thus, it is possible to make an entry into such areas also with much lower costs than perceived earlier. Interestingly again, profit margins are higher in software than in hardware. It is estimated that the margins in hardware are approximately 10 per cent against about 25 per cent in software. Obviously, knowledge-intensive products can extract a higher margin through the monopoly of knowledge unlike the hardware products.

Where does India stand with respect to information technologies? A detailed analysis of India's performance in this sector is available elsewhere [Purkayastha 1991]. There has been a steady net outflow of foreign exchange in this sector which is heaviest in industrial controls and telecommunications. While the balance of payments may not be the only criteria, there is little doubt that in the crucial industrial sectors, viz, process controls and telecom, there is little indigenous development and India is almost totally tied to technologies 'borrowed' from MNCs. In computer hardware, the PC-based market has been a boon. Even here, the goods produced are not globally competitive and the import content is still in the region of 60 per cent-70 per cent. Exports in this sector in the past have been largely 'switch trade' to erstwhile Soviet Union and Eastern bloc. In software, India has entered only the low-value data processing market while importing heavily in the high-value market. The result is that in 1991, against an export of Rs 250 crore, the Indian imports in software were to the tune of Rs 750 crore. And a lot of software that came bundled with the equipment is not included in the above import figure.

In chip-making, after the destruction of the Semiconductor Complex, the Indian presence is very weak. In the 70s, India and

South Korea were roughly on par in this sector. While South Korea has developed apace, particularly in chip-making, India has lagged far behind. Whereas investments in chip-making were relatively low in those days, the entry costs today are very high. However, there is little doubt that without chip-making capability, one may as well give up the electronic industry. The Missile Technology Control Regime (MTCR) and the Nuclear Non-Proliferation Act (NPT) both have as their target a range of electronic goods as well. Not having chip-making capability therefore, also means a much weaker bargaining position in these strategic industries.

Biotechnology and Future Developments

Biotechnology is increasingly becoming a new factor in international economic and technological relations. Its future developments seek to span a wide range—from pharmaceutical/chemical industries to agriculture and animal husbandry. Hitherto, agriculture and animal husbandry have been largely untouched by the revolution in knowledge-intensive technologies. With biotechnology, knowledge-intensive products are encroaching into these sectors as well.

Put simply, genetic engineering and a host of new techniques permit a number of new products to come into the market. The table below gives some idea about the size of the biotechnology market, even though the figures are guesstimates and projections. The market has yet to see a major boom although the potential is already more than evident. Although, Genentech, the largest company in this sector, has yet to make profits while it has invested billions of dollars into research already, the potential is truly enormous.

Biotechnology's entry into pharmaceuticals, chemicals and food additives can provide alternative routes to produce a range of products which are today the monopoly of a few MNCs. Precisely for this reason, chemical MNCs are providing the major support to biotechnology research so that it can be controlled from the outset. Earlier, economies of scale dictated a certain plant size requiring a large amount of capital. With biotechnology it is possible to scale down the production levels so that the entry point investments for such plants becomes much lower. Further, costly laboratory equipment can be avoided with the use of products of biotechnology which give accurate results and are yet not expensive. However, the R and D costs to produce new knowledge is extremely expensive, and provides the major lever of control.

Agriculture would soon see radical changes due to biotechnology. Hitherto, certain nations have had climatic advantages regarding certain products such as spices, fruits, etc. With tissue culture and genetic engineering, it is possible to grow these products elsewhere also. While this may not affect significantly the high volume foodgrain market, the high cost low volume areas like spices are bound to be affected quite drastically. This will thus alter fundamentally the existing relations between the developing countries now producing such commodities and the advanced ones mainly consuming them. Though it is not possible to detail the possible effects of biotechnology on the agricultural trade, it is not difficult to see that the current adverse terms of trade for the third world would become even more so in the future.

Realising the importance of extracting the maximum through their monopoly of producing genetically engineered products, the thrust of countries like the US is to ask for a world-wide strengthening of corporate/commercial interests in the name of intellectual property rights. If cotton is produced in India by using genetically engineered seeds, the Indian farmer would have to pay in royalties for a long period for the use of such seeds. Here, knowledge is the primary commodity sought to be sold and this monopoly is sought to be strengthened under Patent and IPR laws. In this process, changes in patent laws are sought to be introduced like patenting life forms, etc, which were not permissible even in the US before 1980 [Commonwealth Working Group 1986]. This clearly reveals the link between technological changes and these new policy framework being pushed by US and other developed countries, via, Super 301 and GATT.

Enlarging the domain of Patent Laws and other Intellectual Property Rights is important for the US as it has a clear lead in biotechnology through which it seeks a global monopoly. Significantly, the US is now asking other states to conform to the former's domestic laws rather than any international convention/treaty while simultaneously changing its own patent laws to provide greater protection to privatisation of knowledge [Mowery and Rosenberg 1989]. The interesting part of all this is what is sought to be privatised now is what has always been regarded as public knowledge which should be widely disseminated in the interest of human advance. It is the conflict over what should be patented and what should not, that has led to the resignation from National Institute of Health (NIH), USA of Watson, the co-discoverer of the DNA structure. The NIH is currently filing patents for gene sequencing, which is the result of a multinational research project on the human genome.

In agriculture, the current biotechnology revolution has one significant difference from that of the earlier green revolution: the latter came entirely out of the public institutions while the current 'gene revolution' is almost entirely controlled by the MNCs. The third world will have to pay a much heavier price than they did during the green revolution. With billions of dollars at stake, even the results of university research which is publicly funded is now sought to be privatised through deals between universities and MNCs [Dickson 1988]. The Commonwealth Working Group has predicted that there are three implications which are important for developing countries—"(unequal) access to technology, (changing) location of production and development of substitutes (in advanced countries)—and (this) could result in the displacement of agricultural exports from developing countries with marked effects on their balance of payments, income and employment" [Commonwealth Working Group 1986].

Here again India has made few investments in biotechnology. Simultaneously, the department of biotechnology is closely tied to the US biotechnology establishment and it is doubtful whether such an institution can really deliver the goods. With such a composition and little vision, there is every likelihood that India will miss the biotechnology bus much as it had missed the electronics one.

Global Integration

As stated earlier, global integration is a phenomenon which does not seem possible to reverse. An economy which seeks to cut itself off from the global context will lose its dynamism as it will be unable to link up with technological changes taking place across the globe. A continental-sized economy can seek to do this for some limited period, but a long-term strategy of near-autarky will only lead to the slowing down of the process of technological change apart from building inefficient monopolies which tend to emerge under such conditions of a highly protected home market.

However, the process of global integration is obviously not equal between nations. The place each nation has in the process of globalisation depends on its economic, technological and strategic strength. This

paper, of course, focuses on the technological aspects of global restructuring as we believe that in the long run this is the dominant constituent determining global relations. Nations are integrating themselves in the global economy at different levels. We have the poorest countries who are bartering away their natural resources for manufactured goods in increasingly adverse terms of trade. We have the newly industrialised countries who are able to capture some space for themselves globally in manufactured goods. And lastly we have the advanced countries who are producing not only knowledge-intensive goods but also knowledge itself as a commodity. George Keyworth, then president Reagan's science advisor described US leadership in science to be an economic imperative. He also emphasised that if the newly industrialised countries move towards taking a bigger share of the manufactured goods market, "we, along with other advanced nations, will increasingly have to shift to even higher technologies and services" [Dickson 1988].

The development of manufacturing industries in countries like Egypt, India, ASEAN countries, China, Korea, Taiwan, etc, have created conditions where the west can no longer look for a permanent monopoly in all manufactured goods While they continue to fight vigorously to open up other economies while closing theirs, there is little doubt that this cannot be done indefinitely The west is therefore looking to retain its economic dominance by concentrating on the more knowledge-intensive industries. Today the structuring of international technological relations means that technologies for a variety of manufactured goods are available for transfer to third world countries while knowledge-intensive industries are coming under various restrictions

It is important to note that R and D-intensive industries traditionally have higher margins than conventional industries since there is a monopoly in newly created knowledge which permits higher margins in the nature of a 'monopoly rent' The US for instance depends on hi-tech products for its most valuable exports Between 1969 and 1979, for example, US trade surplus in R and D-intensive goods rose from $ 10 5 billion to $ 39.3 billion, during the same period, its deficit in non-R and D-intensive goods went from $ 6.7 billion to $ 34.8 billion [Dickson 1988]. And a large proportion of this increase was in sales to the third world

A special place is occupied by hazardous industries in this process [Ives 1985]. Asbestos production, infamous for asbestosis and lung cancer, has moved to third world and India after its ban in the advanced countries. Similarly, production of benzidine dyes known to cause bladder cancer has moved to Egypt, India, Mexico, etc. Obviously, the infamous document by Lawrence Summers, the erstwhile chief economist of the World Bank, was only seeking to accelerate the ongoing process by arguing that since life is cheap in the third world, hazardous industries should be shifted there so that the west is not starved of these products.

The knowledge-intensive industries, particularly in information technology and materials are often termed strategic industries. They determine the development of a whole range of technologies and provide a competitive edge far beyond their normal domain. That is why these technologies are generally regarded as 'dual purpose' and come under restrictions either under COCOM, NPT, MTCR, etc. Processes for such technologies are also well guarded by MNCs who generally do not license them out. For instance, several studies have shown that while MNCs readily part with new technologies developed as a product, they are loath to do so when processes are involved. One survey [Dickson 1988] showed that when the new technology was developed as a product, in 72 per cent of the cases it was transferred abroad through a foreign subsidiary, 24 per cent by unaffiliated licensing and only 4 per cent by direct exports. However, when processes were involved, 17 per cent was transferred through foreign subsidiaries and in 83 per cent of the cases, the innovation was transferred through export of the resultant products. Unaffiliated licensing was never used in such technologies.

It has been argued [Dickson 1988] that control over the results of scientific research has clear commercial as well as military implications. The military argument can be used to legitimise restrictions on a whole range of technologies so that the commercial interests of advanced countries can be preserved. Thus COCOM regulations restrict transfer of technologies relating to computer networking, software, simulation software, super computers, chip-making, etc, to countries who are not thought to be firmly in the US camp. And all these are required for a wide range of industrial activities as well As many commentators have noted, both in India and abroad, the recent US ban on ISRO and Glavkosmos has as much to do with protection of US commercial interests as with control of missile technologies.

The other element of the restrictions is that it permits access to technology as a tool to bind other nations. Thus certain countries are permitted a share of the strategic industries while some others are not. Given the wider use and impact of these technologies, this would clearly result in the growth of certain selected economies and stagnation/retardation of others. This could then be used to show the advantages of junior partnership with the US as well as legitimacy for a range of economic arguments.

A case in point is developments in South Korea and India in electronics. Undoubtedly bureaucratic controls and a concept of near-autarky, at least in electronics, hampered development of this sector in India. However, it is also true that India was denied chip-making technology except for relatively low-grade qualities while South Korea, on the other hand, was given this access. Similarly, when India went shopping around the globe for super computers, it was denied the same except under conditions of a loss of sovereignty. In deciding upon its use, US personnel decide which problems can be run on the machines bought with Indian money.

The policy of using technology as a tool for arm-twisting has been followed by the US now for over a decade starting with the Kissinger era in US foreign policy. Dixy Lee Ray, former chairman of the US Atomic Energy Commission was to criticise this in fairly scathing terms, saying that Kissinger considered science and technology as bargaining chips to be used against other countries and make them conform to US needs [Dickson 1988]. Increasingly, science and technology were seen by US administrations as tools with which to structure global political relations.

Alternative global structuring—need for new technological paradigm: The above description of the global dominance of those who control S and T knowledge may sound pessimistic, with no visible way out for third world countries, even the relatively developed ones like India Particularly when advanced countries are seeking much greater protection of their 'right' to monopoly over knowledge through new patent/intellectual property right regimes, the chances of being able to change the terms of integration to the global economy may seem rather bleak. Of course, this scenario has been made bleaker by the collapse of the Soviet Union and the absence of any countervailing global force *vis-a-vis* the west And even if there are mutual contradictions between advanced countries/groups such as between the US, Japan, EEC, etc, these may be of little help to the third world. When it comes to transfer of technologies in 'strategic' industries, they all act essentially in concert

The Indian state, after years of arguing the need for state intervention if not control in technology development, is now vociferously arguing for privatising of the state sector and for 'free access' to MNCs This despite the fact that the South Korean, Taiwanese or even the ASEAN cases do not show that MNCs have been major carriers of new technologies In both South Korea and Taiwan, state intervention has played a key

role in technology development, as indeed it did in Japan especially earlier. The presence of MNCs in India, even if they bring some new technologies with them, would not enhance or promote India's capabilities for technology development since these technologies would in any case have been developed abroad and stay within the fold of the MNCs.

The question really boils down to whether a window of opportunity exists for India and similar countries without surrendering to MNCs and the west. In other words, can India participate with greater autonomy in the production of technological and scientific knowledge? Self-reliance in today's world means the ability to produce and exchange scientific and technological knowledge on equal terms rather than reinventing the wheel in every area [Purkayastha 1989]. It is necessary to develop a few such areas through which one can improve the terms of global integration and continuously enlarge these areas. The key would be state intervention in terms of leadership and infrastructural support rather than the exercise of stifling controls.

Perez and Luc Soete [Dosi et al 1989] have argued that the development of technology grows through four phases as depicted schematically in Figure 1. The comparative costs for the innovator and the imitator are shown in Figure 2. Correspondingly, they have also argued that the costs go up with maturity while the scientific and technological knowledge go down with the maturity of the technology. The first phase therefore requires human capital in terms of knowledge and trained human power and therefore permits a window of opportunity to come up with a 'fast second' to new technological innovations at lower costs. This is what Japan has traditionally done especially in the earlier period. South Korea has also demonstrated a similar 'fast second' approach and both these countries have invested heavily in R and D after their initial market successes. While the approach appears attractive, it has some obvious risks in that the initial phase, growth of technology has various directional options. Ultimately, success lies in choosing the correct direction in both market and technological terms. However, there is little doubt that this approach does provide an alternative route to the current dependence upon MNCs being preached by the IMF-World Bank with the Indian government joining the chorus. It is a high risk but low capital route to development of technology.

Perez and Luc Soete have also identified that the other entry point would be the mature phase of technology, namely, phase IV. Here the investment costs are high but risks are low. Traditionally, Indian entrepreneurs as well as the state sector has chosen this route. In this, obviously, the terms of global integration do not change as the skill level required at this stage is not very high and developing a new technology at the mature stage is a near dead end.

We have already stated that indigenisation alone, under conditions of rapid dynamic changes in technology, cannot lead to self-reliance. There is no incentive to produce new technologies as the market is relatively protected and highly oligopolistic. We had also stated that MNCs being given free access will not change the terms of global integration. A dynamic policy for generating new technologies is required with the state providing leadership and promotional support rather than a policing role. What we outline below is a possibility of breaking the stranglehold of the MNCs without necessarily following the 'fast seconds' approach outlined by Perez and Luc Soete. This approach would mean looking beyond the extant technological paradigm and working towards new scenarios of production and distribution with accompanying new technologies which, while meeting domestic demand, could also be globally competitive in terms of both quality and cost. In fact, information technologies provide the potential to actualise such a scenario.

Manufacturing and process industries in advanced countries are undergoing radical changes coupled with advances in information technologies. Given the rapid obsolescence now characterising industry both in terms of products and plant/machinery, flexible manufacturing and batch-processing systems with automated controls are emerging as the alternative to existing fixed structure systems [Purkayastha 1993]. In the latter, when the finished product has become obsolete or when newer manufacturing systems have rendered it uncompetitive, the plant as a whole requires virtual replacement at huge costs. Flexible systems allow for switching of inputs and products with suitable changes in processes in keeping with needs to obviate this problem. Of course, to enable maximum efficiencies, such flexible systems have invariably to be automated.

At present, such flexible systems and their automation systems on mainframe platforms are highly capital-intensive. Currently, traditional CAD/CAM systems can be introduced in plants in the \$ 25 million to \$ 100 million range: while such firms are considered medium-scale in the US and Japan, in India only a few large industries would fall in this category. The possibility exists of developing low-cost automation software on PC-based platforms to suit the smaller scales in India while enabling them to substantially enhance their efficiencies and global competitiveness. Indeed, plant sizes can also be reduced by devising suitable networked systems of sub-units for different production functions: de-scaling of plants has recently received much attention especially in Japan with considerable evidence for reconsideration of traditional notions of economies of scale.

The scope of this paper does not permit a more detailed presentation of this idea. In brief it is argued that, whereas the existing global scenario appears to offer little opportunity for countries like India to break out of the present stranglehold of technological monopoly/control by advanced countries and MNCs, the potential exists for evolving alternative technological paradigms based on contemporary advanced knowledge. In other words, the choice is not only between surrendering to a junior-partner role or following an autarkic reinvent-the-wheel mode. Identifying and exploiting available windows of opportunity, as well as charting new paths, are very real possibilities which are somehow scarcely even considered leave alone pursued. Even with present levels of S and T knowledge, India does have the capability in terms of both human and financial resources to pursue such options. The moot questions, however, are: do we as a nation have the necessary imagination, self-confidence and the political and social will to strike out on unfamiliar roads and reach out to distant goals?

[This paper owes a lot of its ideas to D Raghunandan. G V Ramanna has also contributed a great deal with his comments and criticisms. Some of the ideas in this paper arose out of discussions with Venkatesh Athreya. However, the shortfalls in the paper are necessarily mine.]

Improving Government Performance

What Gets Measured, Gets Done

Prajapati Trivedi

In response to the then prime minister's concern for accountability of top government officials, the Economic Administration Reforms Commission had produced an absolutely superb report on this subject in 1982. Sadly, 11 years after there has been not an iota of increase in the accountability of government officials and departments. This paper examines the reasons for this failure and suggests a practical plan to achieve the goal of increased accountability.

I
Introduction

"OUR purpose is not to criticise government, as so many have, but to renew it. We are as bullish on the future of the government as we are bearish on the current condition of government. We do not minimise the depth of the problem, nor the difficulty of solving it. But because we have seen so many public institutions transform themselves from staid bureaucracies into innovative, flexible, responsive organisations, we believe there are solutions."

This paragraph by Osborne and Gaebler (1992) captures the essence of this paper. It is clear to all thinking people that civilised societies cannot exist without effective governments. The efficiency of the government sets an upper bound on the efficiency of the market system. Thus, to compete in the world today, it is not enough to reform the market system, one must overhaul the working of the government as well. In other words, markets work where government works. This paper outlines a strategy to reinvent the government.

Whether we like it or not, there is a widespread perception that the performance of the Indian government is poor, at best. Even the staunchest defenders of the government give arguments that smack of defensiveness and helplessness. Some of them point out that we should be, in fact, thankful because the performance of the government could be much worse. Others want us to derive some consolation from the fact that the central government is doing a much better job than most of the state governments in India.

The reasons given for the poor performance of the government are also on predictable lines. Most people blame it on the lack of will power among politicians or on a singular and conspicuous lack of efficiency, dedication and commitment on the part of bureaucrats. Unfortunately, people who advance these reasons are mixing up cause and effects. The reasons mentioned above are mere symptoms of the underlying, fundamental cause of poor performance of the government—lack of accountability of the top echelons of civil servants. Another way of saying the same thing is to point out that the people who work in the government are not the problem; rather, the systems in which they work are the problem.[1]

In making the above observation I am neither breaking any new ground nor can I claim much in terms of originality. In response to the then prime minister's concern for accountability of top government officials, the Economic Administration Reforms Commission, known popularly as the L K Jha Commission, produced an absolutely superb report[2] on this very subject in 1982. Sadly, 11 years after this report there has not been even an iota of increase in the accountability of the officials. The main purpose of this paper is to examine the reasons for this failure to increase accountability of seniormost government functionaries and suggest a feasible, practical and necessary game plan to achieve this goal of increased accountability.

II
Reasons for Poor Performance of Government

(1) *Multiple Principals with Multiple Goals:* Secretaries to the government of India have to answer to a number of agencies and institutions of the state. For example, in addition to the parliamentary committees such as the Public Accounts Committee, newly created Standing Committees and parliamentary procedures such as question, motions and debates, the senior government officials have to deal with the Comptroller and Auditor General, enquiry committees and commissions, prime minister's office and the Cabinet Secretariat. Each of the above agencies considers it to be their sacred duty to hold government officials responsible.

The multiplicity of principals would not pose such a major problem if there was a clear agreement or consensus as to what is expected of the seniormost government officials. Unfortunately, various concerned agencies and institutions of the state have diverse and, often, conflicting objectives. As a consequence, the top officials get fuzzy and conflicting signal about results expected from them. Since it is not humanly possible to meet the expectations of all concerned, the officials often end up being criticised by those principals whose mandate could not be fulfilled. This leads to demoralisation, preference for risk aversion and proclivity for non-action.

In addition, the focus by multiple principals on form and procedure, perceived lapses or excesses of the executive has lead to a narrow, negative and formal concept of accountability. This, in turn, has compounded the problem of risk aversion and demoralisation among civil servants. As the L K Jha Commission concluded: "What we have in our system is essentially accountability for error and wrong doing, and not for non-achievement or inefficiency."

(2) *The Not-Me Syndrome:* Another source of poor governmental performance can be traced to the complexity of the functions of the modern government and the nature of its developmental tasks. These tasks are invariably multidimensional and involve a large number of agencies in the process of examination as well as decision-making. This leads to blurring of the organisational as well as individual accountability. Each individual department is eager to pass the blame for delays and inaction on to another sister department. Each department claims that they are not responsible for the final results as they have no control over the decision-making process.

III
Solution for Poor Performance of Government

Common sense tells us that if we wish to improve performance of the government, we must at the very least know what constitutes 'performance'. The L K Jha Commission examined various instruments used by the government to measure performance of the government and found

them severely deficient. The commission concluded, that Annual Plan, Performance Budget and the Annual Reports did not measure up to the task and recommended that each "Ministry/Department should ask itself well in advance what it proposes to do in the ensuing year and formulate as specific and precise an answer to this question as possible." The commission described the document containing this information as an *Action Plan*.

Since the acceptance of the recommendation of the L K Jha Commission in this regard, Action Plan has become an integral part of the functioning of all departments in the government of India.

It was expected that these Action Plans will eliminate the root causes of the poor performance of the government. First, listing of all the tasks various departments were to perform during the year was intended to provide a consistent and unambiguous signal as to what was expected from each department. Any trade-offs among conflicting demands of various principals were to be resolved at the beginning of the year and were not to be used as an excuse to pass the buck at the end of the year.

Second, laying down of precise, quantifiable and measurable targets was intended to provide an objective standard for measuring performance. This, in turn, was supposed to reduce subjectivity in rewarding or punishing officials and thus improve their morale and credibility.

The above expectations were based on sound principles of management and were a precursor to the current best selling book on the subject of improving government performance entitled *Reinventing Government: How the Entrepreneurial Spirit Is Transforming the Public Sector* by David Osborne and Ted Gaebler. Talking about the power of performance measurement, these authors outlined the following basic principles:

(1) What gets measured gets done.
(2) If you don't measure results, you can't tell success from failure.
(3) If you can't see success, you can't reward it.
(4) If you can't reward success, you're probably rewarding failure.
(5) If you can't see success, you can't learn about it.
(6) If you can't recognise failure, you can't correct it.
(7) If you can demonstrate results, you can win public support.

IV
Problems with Action Plans

As has been the fate of many other public policies, the Action Plans were never really implemented effectively. Hence, a good idea remained just that—an idea waiting to be implemented properly. In its current form, Action Plans in most cases represent an exercise in futility. That is, the manner in which Action Plans are being implemented currently, they have not added to the improvement in the 'quality of accountability'. As we shall see below, even if we take up the exercise in all its seriousness, the Action Plans as designed currently will not take us very far. The problem is not necessarily with the "will" to implement. The main reason for this problems lies in the conceptually flawed design of the current batch of Action Plans. Because these Action Plans are congenitally flawed, even the best intentions in the past have yielded no results. Let us, therefore, examine the major flaws with the current design of Action Plans.

Problem Number 1: A glance at the 1993-94 Action Plans suggests that there is a fundamental confusion among departments regarding the very purpose of these Action Plans. This is reflected most dramatically in the fact that some departments have an Action Plan document that is 10 pages long (Department of Mines), whereas, others have Action Plans that are close to 100 pages (Department of Telecommunications and Department of Power). The latter include detailed performance parameters for all organisations under them. Their own department's performance parameters are a minuscule part of these documents.

Either these departments are genuinely oblivious of the rationale, purpose and objectives of the Action Plan exercise or they have included a humongous amount of details to create an incorrect impression that they are responsible for a lot of action.

Problem Number 2: Even if we accept the contents of a particular department's Action Plan at its face value, it is impossible to measure its performance at the end of the year using the current documents. For example, the 1993-94 Action Plan for Ministry of Power lays down a list of 24 activities to be done during the period April-June 1993. Now if at the end of this quarter, they inform the Cabinet Secretariat that they have been able to perform only 20 activities out of a total of 24, how are we to judge their performance? Since all 24 activities are not of equal importance, we cannot really judge their performance correctly or objectively. It is possible that they may have completed the less important activities and ignored the more important ones.

TABLE 1: AN EXAMPLE OF CRITERION VALUES

Criterion	Units	Weight	Criterion Values				
			1 Excellent	2 Very Good	3 Good	4 Average	5 Poor
Submission of PIB note on Agartala Gas-based power project	Months	0.05	By June 15 1993	By June 30 1993	By July 15 1993	By July 30 1993	After August 15 1993

TABLE 2: SAMPLE CRITERIA FOR EVALUATING PERFORMANCE OF DEPARTMENT OF MINES

	Criterion	Units	Weight
1	Reduction in cost of administration	Percentage	0.10
2	Design and implement a performance evaluation system for organisations under the ministry	Number of organisations	0.15
3	Timely appointment of personnel in organisations under the ministry	Percentage appointed prior to the departure of the incumbent	0.10
4	Seriousness of monitoring effort of organisations under the ministry	Percentage of planned QPRs held as per the schedule	0.05
5	Preparation of the sectoral policy and securing its approval by the cabinet	Months	0.10
6	Timely decision on investment proposals of organisations under the ministry	Index based on weighted average of on time performance	0.10
7	Timely publication of various statistical and informational publications brought out by the ministry	Percentage published on schedule	0.05
8	Timely completion and review of CRs	Percentage completed	0.05
9	Simplification of procedures: preparation of a report on the subject	Months	0.05
10	Quality of target-setting for MOU signing enterprises	Discrete	0.03
11	Quality of office environment in the ministry's secretariat	Discrete	0.03
12	Progress in meeting the election manifesto commitments	Index	0.15
13	Percentage of commitments met in the MOUs	Per cent	0.03
14	Responsiveness to public queries	Discrete	0.03

Thus, what is required is prioritising the activities by attaching weights to them. This is not a new idea as most departments are used to doing this while negotiating Memoranda of Understanding (MOUs) with public enterprises under their supervision.

Problem Number 3: Even if we take care of the above two problems, one will have to overcome yet another congenital fatal flaw with Action Plans. The Action Plans in their present form ask the departments to specify specific target dates for each activity. However, they do not give any indication regarding how to interpret any deviation from the target dates.

For example, one item in the 1993-94 Action Plan for the Ministry of Power is 'Submission of PIB Note on Agartala Gas Based Power Project by June 1993'. Now if the note is submitted in August 1993 as opposed to June 1993, how are we to judge the ministry's performance? Clearly, the current system would give the Ministry of Power no credit at all. This may not only be 'unfair' but its perverse effects on the incentive structure may be also 'dangerous'. If in the month of May 1993 the ministry realises that it cannot meet the June 1993 deadline, it may decide to completely freeze action on this front and move its focus to other activities where it still has the potential to meet the June 1993 deadline. This is a common problem with all-or-nothing deadlines.

The solution to this lies in not having a single target but a 5-point scale as shown in Table 1.

Problem Number 4: A related but equally important problem with the current system arises out of the confusion created as a result of two parallel action plans—one relating to the implementation of 'election manifesto' of the ruling party and the other to the usual activities of the departments. This situation is analogous to having two 'profit and loss' statement in a business. The perverse consequences this duality of action plans has on motivation and behaviour are predictable and vindicated by the available evidence.

For example, it is not clear which action plan is more important from government's point of view. Common sense would suggests that elected officials are likely to care more about the action with respect to the election manifesto. This, in turn, implies that much of the 'other' work will suffer.

The sum total of the above-mentioned four problems with the current system of Action Plans is to make them absolutely useless as instruments for measuring 'performance' and achieving accountability.

For a democratically elected government, the absence of accountability of implementors of electoral promises becomes a fatal flaw. The elected officials are obviously held accountable by the cycle of elections, thus it is only 'fair' that they have a management control system which provides them an instrument to get 'results' and not excuses for non-performance.

The answer does not lie in increasing the 'quantity' of controls. Rather, the focus has to shift to increasing the 'quality' of control. This can be achieved by reducing the reports submitted by the government departments and improving the design of the Action Pans.

V
Action Plans Reinvented

The heart of the action plan consists of the *performance evaluation system*. Thus any improvement has to focus maximum possible attention in this area. We suggest that the design of new Action Plans—referred to as *Performance Contracts* in the future—should involve the following four steps:

Step 1: Criterion Selection. The first step is to choose a set of criteria to measure the performance of the department. The criteria to choose these criteria—the mega criteria—are simple. First, we must insure these criteria are 'fair' to the secretary or the head of the department. That is, they must only encompass those areas over which the secretary to the government has control. Second, these criteria should also be 'fair' to the country.

For example, inclusion of profits of the public enterprises under a particular department as a criterion may not be 'fair' to the secretary because he or she is not a super managing director and should not be made to behave like one.

A sample of possible criteria for evaluating the performance of the Department of Mines is given in Table 2. This is only an illustrative list for stimulating discussion. Much more intimate knowledge of the relevant department is required than what the author can legitimately claim.

Step 2: Criterion Weight Selection. Once the relevant criteria have been identified, we must indicate the relative priorities by attaching a series of weights to each criteria as shown in the *Performance Contract* (Appendix I). This makes it easier for the secretaries to decide what is more important when the chips are down and they have to ration their precious resources. These weights have to be determined by a process of mutual negotiations between the two parties entering into a *Performance Contract.*[3]

Step 3: Criterion Value Selection. The next step is to select a target value for each performance criteria. However, instead of having a single value, one must choose a five-point scale for the reasons discussed earlier in this paper.

Step 4: Performance Evaluation—Calculating the Composite Score. The real revolution in the new design proposed lies in this step. Appendix II shows how the Composite Score for the hypothetical Performance Contract may be calculated. This is a rather simple procedure of calculating a weighted score for performance on various fronts.

If the department does an excellent job on all fronts, then they are likely to get a composite score of '1'. On the other hand, if the department does a lousy job on all fronts, then it will end up with a composite score of '5'. A combination of 'excellent' and 'poor' performance is likely to yield a composite score which lies between 5 and 1.

As can be seen from the Appendix II, one has to first compare the achievement with respect to criteria values and determine the 'Raw Score' on a scale of 1 to 5. Then, one has to multiply this 'Raw Score' with the respective weights and calculate the 'Weighted Raw Score'. The sum of weighted Raw Scores gives us the Composite Score. In the hypothetical case of the Ministry of Mines, we find that the Composite Score turns out to be 2.10, which is close to 'Very Good'.

VI
How to Interpret Composite Scores

If we had composite scores for all departments, it would provide us with a unique measure of comparative performance. However, it is important to note what is being compared. We are not comparing the individual tasks of various government departments. Rather, we are comparing the ability of respective departments to meet their commitments to which they had agreed to at the beginning of the year. While many tasks undertaken by the Department of Power are likely to be different from those of the Department of Family Welfare or the Ministry of Mines, yet their ability to meet their respective commitments can be certainly compared.

TABLE 3: PERFORMANCE OF MINISTRY/DEPARTMENTS AT END OF YEAR

Name of the Ministry/Department	Composite Score
Department of Fertiliser	1.08
Department of Industrial Development	1.15
Department of Public Enterprises	1.18
Department of Steel	1.22
Department of Economic Affairs	1.26
Department of Company Affairs	1.46
Department of Mines	2.1
Department of Power	2.15
Department of Personnel	2.31
Department of Atomic Energy	2.53
Department of Coal	2.75
Department of Heavy Industries	2.78
Department of Petrochemicals	2.81

At the end of the year, the prime minister's office can announce results which may look like as follows [4]

The potential impact of this kind of list is mind-boggling It will create a sense of competition among government departments to perform the basic tasks assigned and serve the public interest, which is the very core of the proposed reform The above list is a sort of an index of performance in a hypothetical stock market for the government departments

VII
Policy Options

Anybody who has given serious thought to the whole issue of accountability in the government, will soon come to the conclusion that the current system of Action Plans is in a serious need of fine tuning There does not seem to be much option in this regard However, on individual aspects of this overall proposal, there are some options available to us

Name of New Instrument In public policy arena nomenclature is a substantive and not merely a cosmetic issue Essentially we have three options

(a) Continue to call it an Action Plan and simply change the contents by asking departments to select a more appropriate set of criteria attach weights to indicate *inter se* priorities among them and device a 5 point scale of criterion values rather than a single target

(b) Call it Performance Contract to emphasise the contractual obligation that the department heads have in fulfilling their respective targets

(c) Call it Performance Agreement to indicate that it is a professional agreement and not a legal contract as may be inferred by some if we use the term Performance Contract

(d) Call it Performance Evaluation System in order to send a clear signal regarding its intended purpose This term also de emphasises the corresponding obligations of the government and lowers the expectations in this regard that the evaluatees may have The lessons from the government of India's MOU policy should not be lost sight of There the public enterprises were given an exaggerated impression that MOUs will provide a vehicle to make their performance conditional on all kinds of unrealistic expectations and commitments from the administrative departments It took several years of education to convince public enterprises that MOUs want to measure performance in the "real" world not in some imaginary Utopian world

Institutional Arrangement The literature on performance evaluation clearly suggests that "who" measures performance is as important an issue as "how" performance is measured Here, again, we have some choices

(1) Cabinet Secretariat The Performance Contracts could be between the Cabinet Secretariat and respective government departments This would be the most natural and least disruptive option since the Cabinet Secretariat is already the lead agency in this regard One will have to, however, consider the issue relating to how the differences in opinion between Cabinet Secretariat and the departments will be resolved Will this require the intervention of prime minister in order to ensure fairness or will the Cabinet Secretary have the final say

Also, one will have to consider issues relating to the expertise and time availability for this purpose at the Cabinet Secretariat In this connection, one will have to think of creating a think tank of experts to assist the Cabinet Secretariat in the initial stages

(2) Standing Committees Once the new concept of Performance Contract is accepted it would be essential to synchronise other performance evaluation exercises in order to achieve the objectives of the proposed reforms This instrument could be used to make the parliament-government interface more focused and effective

Scope of the Policy The coverage of the policy, i e, number of departments to be covered under the proposed policy will have to be decided with great care Basically we have two options in this regard According to one option it may be desirable to start with the infrastructure ministries and departments This option has two advantages It will be easy to manage the process of designing and implementation of a handful of Performance Contracts for these departments In addition, it is likely to be relatively easier to prepare Performance Contracts for departments dealing with infrastructure

According to the second option, it may be more convincing as well as necessary to start with Performance Contracts for all departments This will reduce the possibility of one weak link in the chain of government departments becoming a constraint on the performance of all others Moreover, it may suggest that the government only cares about efficiency of a select few departments and not others If efficiency is important then one must find resources to do the best possible job

Complementary Policy Decisions To make this policy effective, it would be necessary to take a few other supportive measures For example, one will have to consider the option of giving a secure tenure to a secretary to the government for the duration of the Performance Contract Therefore, if a secretary is due to retire in September of a particular year, he or she will have to be allowed to continue till the end of March in the following year This will prevent the disruptive impact of frequent changes at the top level during the year and would be necessary for ensuring the sanctity of a yearly agreement Similarly, many other complementary decisions may also be necessary for the eventual success of this system

VIII
Why This Cannot be Done: Expected Sources of Resistance

As a French scholar once said, systems are not required for the top 10 per cent or the bottom 10 per cent The top 10 per cent will continue to do the right things with or without a system Similarly, the bottom 10 per cent will always try to find ways to beat the system However for the rest of the 80 per cent investment in designing systems is likely to pay rich dividends

As with any change, one must expect resistance In what follows, we have tried to anticipate the most likely lines of argument against the current proposals

Argument Number 1 It is impossible to evaluate our performance This is exactly the same argument given by public enterprises when the system of Memorandum of Understanding (MOU)[5] was introduced However, it was found that, indeed, some aspects of public enterprise operations are difficult to quantify, but a little thought and ingenuity is required to overcome this barrier It is our firm conviction, that one can find good proxies for qualitative as well as non-economic aspects of government operations One has to only ask some of the retired secretaries, and one will be flooded with ideas These people have no vested interests in the *status quo* and can be an invaluable source of most innovative ideas

This is not an academic issue This barrier has been overcome in the past by many ministries who have done a fine job of selecting appropriate criteria for measuring their performance Our research shows that the best example is the 1985 Action Plan for the Department of Irrigation It is the only case which truly captured the spirit of the recommendations of L K Jha Commission in this regard The government should have circulated this document and held "information-cum-training" sessions to effectively implement this policy

Argument Number 2 There are too many unpredictable variables in running a government department and, hence, it is not possible to measure performance objectively If every thing was predictable, there would not be any need for the leadership of senior government officials The junior officials could do every thing on a routine basis The proposed system of Performance Contract does not expect

Appendix I: Outline of a Sample Performance Contract

PERFORMANCE CONTRACT BETWEEN CABINET SECRETARIAT AND MINISTRY OF MINES

I Mission of the Ministry:
To achieve the highest standards of excellence in the regulation and development of the mineral sector including the mining and metallurgy of all non-ferrous metals (excluding Natural Gas, Petroleum Coal and Atomic Minerals) both in the public and private sectors

II Main Activities under the Ministry:
The principal economic programmes / activities under the Ministry of Mines are:
i Survey and Mapping
ii Mineral Exploration
iii Mineral Development and Research
iv Production of Non-ferrous Metals
v Science and Technology Programmes for Mining and Non-ferrous Metals
vi Direction and Administration for Mining and for Production of Non-ferrous Metals

III Commitments of the Ministry (see Appendix Table I)

IV Commitments of the Government:
In order to achieve the commitments mentioned in Section III, the Ministry of Mines will require the following assistance from the Government:
1 Timely clearance of Personnel appoints by the ACC
2 Timely clearance of investment proposals by CCEA

Cabinet Secretary
Government of India

Secretary
Ministry of Mines

APPENDIX TABLE I

Criterion	Units	Weight	Criterion Values 1 Excellent	2 Very Good	3 Good	4 Average	5 Poor
1 Reduction in cost of administration	Percentage	0 10	15	12	10	8	5
2 Design and implement a performance evaluation system for organisations under the ministry	Number of organisations	0 15	9	8	7	6	5
3 Timely appointment of personnel in organisations under the ministry	Percentage appointed prior to the departure of the incumbent	0 10	100	95	92	90	88
4 Seriousness of monitoring effort of organisations under the ministry	Percentage of planned QPRs held as per the schedule	0.05	100	95	92	90	88
5 Preparation of the sectoral policy and securing its approval by the cabinet	Months	0 10	By December 1994	By January 1994	By February 1994	By March 1994	After March 1994
6 Timely decision on investment proposals of organisations under the ministry	Index based on weighted average of on time performance	0.10	1	2	3	4	5
7 Timely publication of various statistical and informational publications brought out by the ministry	Percentage published on schedule	0 05	100	95	90	85	80
8 Timely completion and review of CRs	Percentage completed	0 05	100	98	96	94	92
9 Simplification of procedures Preparation of a report on the subject	Months	0 05	By November 1994	By December 1994	By January 1994	By February 1994	By March 1994
10 Quality of target-setting for MOU signing enterprises	Discrete	0 03	1	2	3	4	5
11 Quality of office environment in the ministry's secretariat	Discrete	0 03	1	2	3	4	5
12 Progress in meeting the election manifesto commitments	Index	0 15	100	95	90	88	85
13 Percentage of commitments met in the MOUs	Per cent	0 03	100	95	90	85	80
14 Responsiveness to public queries	Discrete	0 03	1	2	3	4	5

Appendix II: How to Evaluate Ministry's Performance (Calculation of Composite Score)

CALCULATION OF COMPOSITE SCORE FOR THE MINISTRY OF MINES

Criterion	Units	Weight	Achievement	Raw Score	Weighted Raw Score
1 Reduction in cost of administration	Percentage	0 1	12 00	2 00	0 20
2 Design and implement a performance evaluation system for organisations under the ministry	Number of organisations	0 15	9 00	1 00	0 15
3 Timely appointment of personnel in organisations under the ministry	Percentage appointed prior to the departure of the incumbent	0 1	91 00	3 50	0 35
4 Seriousness of monitoring effort of organisations under the ministry	Percentage of planned QPRs held as per the schedule	0 05	95 00	2 00	0 10
5 Preparation of the sectoral policy and securing its approval by the cabinet	Months	0 1	February 1994	3 00	0 30
6 Timely decision on investment proposals of organisations under the ministry	Index based on weighted average of on time performance	0 1	2 75	2 75	0 28
7 Timely publication of various statistical and informational publications brought out by the ministry	Percentage published on schedule	0 05	100 00	1 00	0 05
8 Timely completion and review of CRs	Percentage completed	0.05	98 00	2 00	0 10
9 Simplification of procedures, preparation of a report on the subject	Months	0 05	December 1994	2 00	0 10
10 Quality of target-setting for MOU signing enterprises	Discrete	0 025	1 00	1 00	0 03
11 Quality of office environment in the ministry's secretariat	Discrete	0 025	2 00	2 00	0 05
12 Progress in meeting the election manifesto commitments	Index	0 15	95 00	2 00	0 30
13 Percentage of commitments met in the MOUs	Per cent	0.025	100 00	2 00	0 05
14 Responsiveness to public queries	Discrete	0 025	2 00	2 00	0 05
			Composite Score		**2.10**

to reduce all measurements to only predictable indicators Rather, the goal is to encourage top officials to do contingency planning by identifying sources of uncertainty

Argument Number 3 Performance of government departments is dependent on the performance of others and, hence, it is not possible to isolate their share in the total performance First, let us try to at least delineate those areas that are within the control of the department and those that are not This in itself would be a major achievement Second, one can work out the precise contributions made by each department and design a system accordingly In particular, the idea of a 'lead department' which has the primary responsibility for delivering the final service as suggested by the L K Jha Commission may need to be seriously considered

Concluding Comments

The task outlined above is simple yet profound In one sense we are merely fine-tuning the existing public policy instrument of Action Plans Yet, the modifications suggested are intended to bring a major qualitative change in the functioning of the Indian government This is the first crucial step to transform a process-oriented government to a result-oriented government We have no choice in this matter It must be done Other countries have started the process and are already ahead of us in this regard We must therefore begin and we must begin now

Notes

[The views expressed in this paper are solely those of the author]

1 The present paper is in line with a well established tradition in this field represented by important contributions to it by McKean (1958), Hendricks (1981) Miller (1984) Johnson and Lewin (1984) Wholey and Newcomer (1989) and Lane (1993)
2 Economic Administration Reforms Commission Report No 29 on Accountabiliy', June 30, 1982
3 See Downs and Larkey (1986) for more on this aspect
4 This is purely for the sake of illustrating the point in a manner that brings it closer to home more effectively It should not be taken to reflect the reality which is unknown at the time of writing this paper
5 Good principles of management are, indeed transcendental Thus, there is a great degree of similarity between the principles underlying the government of India's policy on Memorandum of Understanding (MOU) for public enterprises and the proposed Performance Contracts for the administrative departments For further details on the MOU policy, see Trivedi (1990 and 1992)

State Level Public Enterprises in India

An Overview

T L Sankar
R K Mishra
R Nandagopal

This article discusses the origins, forms of organisation, objectives, growth, typology, investment and capital financing, use of investments, financial performance, return on equity and resource mobilisation in state level enterprises.

STATE level public enterprises (SLPE) are an important segment of the public enterprise system in India. They are vital instruments of public policy for the states. There has been a spectacular growth in the number of these enterprises and the investment in them since the 50s. However, their financial record has been utterly disappointing. At a time when the state governments are facing a severe resource crunch, it is of great interest to know how these enterprises have been performing in respect of the return on investment. No reform programme can succeed unless the SLPEs turn the corner to become financially viable and only such enterprises are retained in the SLPEs portfolio which are high on social purpose. It is, therefore, essential to study their financial record and the related aspects. This paper proposes to discuss the origins, forms of organisation, objectives, growth, typology, investment and capital financing, use of investments, financial performance, return on equity and resource mobilisation in the SLPEs.

Origins and Growth

The SLPEs owe their existence more to historical factors and pragmatism than ideological considerations. A large number of the SLPEs came into being on account of historical necessity, in that, the erstwhile princely states were owning them prior to the formation of the present states of the Indian union. Many of the present SLPEs were born on account of the decisions of the state governments to wind up their departmental economic activities and organise them in the form of autonomous units. A large number of these enterprises were set up as public organisations to take advantage of the institutional funding from the long-term financial institutions and development banks as these institutions do not extend financial support, as a policy measure, to the government departments. Many SLPEs were set up in pursuance of the enactments legislated by the central government to make the states of the Indian Union partners in propelling such activities and evolving a uniform framework for the control and implementation of policies in respect of such sectors. A large chunk of the SLPEs have been set up to undertake promotional activities to provide infrastructural and institutional support for the developmental activities by the states. An important component of the SLPEs in this category relates to the welfare corporations which have come up almost in all the states following the all-India pattern.

Finally, a considerable number of these enterprises have seen the light of the day on account of the decisions of the various state governments to assume the entrepreneurial responsibilities.

Growth of SLPEs

There has been a massive growth in the number of SLPEs. From a mere 51 in the 1951-60 decade, the number of these enterprises shot up to 135 during 1961-70. The number of SLPEs established in 1971-80 covered around 300. During 1981-86, the number of new SLPEs established was estimated to be 350. Between 1986-87 and 1991-92, SLPEs have come up as new economic entities. As on March 31, 1992 the number of SLPEs stood at 954 including co-operative enterprises, but excluding state electricity boards and the state road transport corporations. In terms of numbers these enterprises are more than four-fold of the central PEs. As on March 31, 1992 there were 243 enterprises in the central sector. The SLPE system substantially expanded during 1961-80 in Andhra Pradesh, Gujarat, Haryana, Himachal Pradesh, Kerala, Maharashtra, Orissa, Punjab, Bihar, Uttar Pradesh and Rajasthan. In many of the states, viz, Assam, Nagaland, Mizoram, Manipur, Tripura and Arunachal Pradesh, the growth of SLPEs has been a more recent phenomenon. The growth rate of the SLPEs in terms of number has slowed down during the years 1986-87 to 1991-92.

Objectives of SLPEs

The objectives of the SLPEs vary widely across the various states. In main, they have been set up to exploit the local resources, mobilise institutional finance,

fulfil social purposes, speed up the rate of growth, act as catalysts for the development of specific backward areas or target population groups and earn surpluses. In other words, they were set up at different points of time to implement the public policy by the various state governments

Table 1 shows that the SLPEs have been organised under a variety of legal structures These include government companies, departmental concerns, public boards and statutory authorities, societies, co-operative enterprises and federations About 75 per cent of these enterprises have been organised as government companies under the Companies Act Again most of these government companies have been organised as private limited companies About 10 per cent of these enterprises have been incorporated as public corporations, public authorities and statutory boards The co-operative enterprises constitute about 15 per cent of the total number of these enterprises

SLPEs are engaged in a wide variety of activities ranging from industrial development agro industries, mining and mineral development, manufacturing small industries promotion, passenger road transport, export promotion, electricity generation and supply warehousing, financial assistance, dairying and milk supply printing and publishing river transport commodity trade and fisheries development In the recent times they have taken up the responsibility of developing the small industries and tourism potential Table 2 reveals that in terms of number and total investment, the SLPEs engaged in commercial and commercial-cum-promotional activities dominated the overall SLPE scenario The SLPEs could be grouped under three broad categories as follows (1) commercial enterprises, (2) commercial cum-promotional enterprises, and (3) promotional enterprises

As on March 31, 1992 there were 436 commercial, 312 commercial-cum-promotional and 127 promotional enterprises in the country The study of the typology in terms of the number of the SLPEs points out that the relative importance of different kinds of SLPEs differed in the various states in view of their economic strategy For example, the states such as West Bengal and Kerala set up more manufacturing enterprises in view of their strategy to participate in directly productive activities As opposed to this, the states such as Maharashtra, Gujarat and Tamil Nadu preferred to set up more promotional enterprises in view of their strategy to accelerate the pace of economic development through helping the private sector enterprises In the states such as Uttar Pradesh, Bihar and Maharashtra the emphasis was more on setting up area development enterprises as these states went in for the area development approach which is the key component of their economic and political strategy

Investment

Table 3 shows that the investment in the SLPEs as on March 31 1986 turned out to be Rs 17831 crore This rose to Rs 38283

crore as on March 31, 1992 The investment in the SLPEs grew at the rate of 20 per cent per annum during the period 1986-87 to 1991-92 Andhra Pradesh, Arunachal Pradesh, Gujarat, Goa, Kerala, Manipur, Madhya Pradesh, Tamil Nadu, Tripura, Uttar Pradesh and West Bengal recorded higher growth in the investment in SLPEs Bihar, Punjab, Sikkim, Karnataka, Haryana, Nagaland, Meghalaya and Rajasthan recorded less than the average growth in the investment in the SLPEs

The debt-equity ratio heavily leaned in favour of the debt component In most of the states the debt component assumed high proportions mainly due to the fact that the accumulated losses were funded by way of an equal amount of debt in these enterprises Table 4 reveals that the debt-equity ratio was much higher than the stipulated 1 1 in respect of the SLPEs in the various states The high debt-equity ratio posed a great financial threat to these enterprises as is evident from Table 5 showing the interest coverage ratio for the SLPEs of the various states The interest coverage was much below the ideal 3 1 prescribed by the financial experts In fact, in the case of West Bengal and Tripura SLPEs, the coverage turned out to be negative signalling the threat of bankruptcy

The efficiency of investment is measured in terms of its productivity in relation to the generation of goods and services The turnover to investment ratio is an index of the use of money invested in an enterprise which is computed by dividing the turnover by investment The use of investments was very inadequate in the SLPEs Table 6 shows that for all the states taken together, the capital invested to turnover ratio was 0 99 1 as on March 31, 1986 indicating that per rupee of investment the turnover was only about Rs 0 99 in these enterprises This ratio phenomenally improved to 2 06 1 in 1989-90 However, this trend could not be maintained in the later years as the ratio declined to 1 87 1 in 1991-92 The states where the ratio was below the national average as on March 31, 1992, included Bihar, Goa, Gujarat, Karnataka, Madhya Pradesh, Maharashtra, Manipur, Meghalaya, Nagaland, Rajasthan, Sikkim, Tripura, Uttar Pradesh and West Bengal

Financial Performance

The net profits/losses of an undertaking represent the financial performance of an undertaking Table 7 shows the financial performance of the SLPEs during the period 1986-87 to 1991-92 Table 7 showing the financial results of the SLPEs points out that they have a long way to go in order to turn the corner The net losses for all the enterprises taken together shot up from Rs 86 crore in 1985-86 to Rs 863 4 crore in 1991-92 The position of the SLPEs in the states such as Uttar Pradesh, Andhra Pradesh, Bihar, Karnataka, Kerala, West Bengal, Nagaland, Manipur, Assam, and Orissa was very dismal The SLPEs in the states such as Maharashtra, Madhya Pradesh, Rajasthan, Haryana and Gujarat, on the other hand, have done somewhat better On the whole, put together these enterprises across the various states had never earned profits during any year of the study

The internal resource generation helps enterprises to plough back the money for financing, modernisation, renovation and expansion. It also adds to the autonomy of an enterprise. The performance of the SLPEs was not encouraging with regard to the generation of internal resources during the period 1986-87 to 1991-92. Table 8 shows that the generation of internal resources in these enterprises doubled from Rs 540 crore in 1985-86 to Rs 1071 crore in 1991-92. The internal resource generation approximated to 3 per cent point of total investments in the SLPEs. No state displayed an encouraging trend in this sphere.

Total Management Performance

The total management performance represents the sum total of the efficiency and effectiveness in each of the functional areas of management as well as the type of management itself. Since there is no single unified measure capable of reflecting the total management performance, we have taken "from keeping the net worth intact to its maximisation" as the indicator to evaluate the total management performance of the SLPEs. The study of the 'net worth' in these enterprises points out that it did not register any increase as the SLPEs on the whole across different states had accumulated colossal losses. Table 9 shows that the accumulated losses to paid up capital, on an average, increased from 5 per cent in 1986-87 to 54 per cent in 1991-92. In other words, one rupee of investment in the SLPEs taken as a whole was worth 50 paise in 1985-86 and 46 paise in 1991-92.

The preparation and finalisation of accounts is in shambles in the SLPEs of the various states. The SLPEs are entities whose financial performance and position is reflected through their income statements and balance sheets. The preparation of these financial statements is obligatory in terms of statutory as well as strategic requirements. Our study, on the contrary, points out that the SLPEs have shown scant respect for the finalisation of accounts. More than half of the total number of the SLPEs had not finalised their accounts for a period ranging from one to 15 years as on March 31, 1992 in Assam, Bihar, Jammu and Kashmir, Manipur, Kerala, Nagaland, Tripura and Uttar Pradesh. The position of the other states was none too happy. The reasons for the non-finalisation of the reports ranged from non-completion of the books of accounts, preparation of financial statements, and statutory audit to the delays in the appointment of the statutory auditors by the Comptroller and Auditor General and their adoption for the annual meetings. Many states decided more than once to root out these problems by tying up the loose ends but with no success. The lack of professional staff in the accounting and finance departments has posed the major limitation in this regard. Our study on the delay in the finalisation of accounts for the SLPEs in Andhra Pradesh points out the following factors responsible for the phenomenon: (a) statutory audit delay, (b) delay in board approval for accounts on account of the interim board's reluctance to take up the matter, (c) bad health of auditors, (d) delay in composition of accounts, (e) improper records, (f) lack of sufficient accounts personnel, (g) delay in recalling reports from circle offices, (h) lack of proper accounting systems, (i) no proper upkeep of branch accounts, (j) non-availability of registers, vouchers, and auditors' refusal to give even qualified reports, (k) delay in statutory auditors' appointment by the Company Law Board and delay in audit taken up by auditors, (l) delay in receipt of Comptroller and Auditor General's comments, and (m) extending of accounting year pursuant to change in the income-tax law.

Summing Up

The SLPEs are an important component of the Public Enterprise System in India. No reform programme could succeed unless these enterprises turn the corner. The SLPEs have disparate origins and they perform a variety of tasks. Their macro-objectives are both multiple and conflicting in nature. The investment in these enterprises more than doubled during the seven-year span of the study. About 75 per cent of these enterprises have been set up as government companies. A substantial number of the SLPEs are involved in commercial functions followed by the enterprises in commercial-cum-promotional and promotional categories. The use of investment has been abysmally low in these enterprises. Their financial results have been awfully disappointing. The accounting systems in these enterprises have been found to be in total disarray. The preparation and finalisation of accounts have been in arrears for a period ranging from one to 15 years in the case of many a SLPE.

Divesting State Ownership

A Tale of Two Companies

J L Bajaj

As many state governments are contemplating sale of equity in their public enterprises, the contrasting experience of privatisation of two state government enterprises in UP may hold some valuable lessons.

THE budget of state governments since 1985 have exhibited an increasing tendency to allocate large resources to revenue expenditure instead of capital investment. As a result balance from current revenue and contribution of state enterprises have been much below the Plan target. This is despite the fact that revenue receipts of the state government have grown at least as fast as the State Domestic Product. The decline in balance from current revenue has mainly been due to the growth in non-plan expenditure.

Uttar Pradesh has not been an exception to this trend. Tables 1 and 2 depict the pattern of financing of capital formation in the state in the period 1970 90. Current revenues excluding transfers from the government of India have consistently been inadequate to finance current outlays. However taking into account the state's share in taxes levied by the union government there was surplus available for capital investment. This surplus increased from Rs 390 71 crore in the period 1970-75 to Rs 1 040 91 crore in 1975 80. Since 1985 there has been a sharp deterioration in current surplus and it became negative Rs (-) 2 053 74 crore in 1985 90 exceeding the surplus in the previous 10 years. The ratio of current savings to current revenues increased from 15 7 per cent to 19 5 per cent in the period 1970 80 but dropped sharply to 9 per cent in 1980 85 and to a negative level (-10 per cent) in 1985-90. This slowed down the growth of capital expenditure at current prices from 16 34 per cent during 1974 75 1980 81 to 10 per cent between 1981 82 and 1988-89. An important factor in the decline in the availability of resources for capital investment was the inability of the state enterprises to generate an adequate rate on return on their investment.

In Uttar Pradesh most of the public sector undertakings were established after 1970. Their number excluding the State Electricity Board increased from 11 in 1970 to 39 in 1975 and reached 63 in 1990. These undertakings were set up to improve infrastructure facilities like electricity supply, bridges and roads promote industrial development, render assistance to traditional arts and crafts, distribute and market products produced in the state and facilitate development of backward regions. At the end of 1989-90 the total investment in these undertakings (excluding UPSEB) was Rs 4,835 90 crore of which the state government contributed Rs 2,146 35 crore as equity and loan. These enterprises had also taken loans from financial institutions, commercial banks, etc, amounting to Rs 1,480 35 crore up to 1989-90. Twenty-six enterprises in the state had been incurring losses in the previous three years up to 1989-90. The cumulative deficit of the 63 state enterprises had reached Rs 905 61 crore in that year. The financial results of the operation of these undertakings are summarised in Table 3.

Eight of the enterprises were engaged in manufacturing. The cumulative loss in the operation of manufacturing enterprises had reached Rs 512 88 crore at the end of 1989-90 (Table 4).

The performance of state sector manufacturing enterprises in almost all the states has been quite poor. Their problems revolve around operational deficiencies in these enterprises including lack of systems and procedures with regard to purchase and upkeep of raw materials, recruitment, promotion and motivation of personnel, formulation of suitable credit collection and cash management policies and choice of appropriate credit mix. These enterprises have been a drain on the state government's finances. Badly planned, poorly managed and heavily indebted, the operations of these enterprises have not fulfilled the objectives for which they were set up. A major problem in their functioning has become an important component of the programme to improve the finances of the state governments. The sale of shares owned by the government of Uttar Pradesh in UP State Cement Corporation and Auto Tractors has attracted considerable interest. In case of UPSCC, petitions were filed by trade unions representing workers and officers alleging that proper valuation of assets was not done and that the shares were sold at a very low price. The opposition by workers led to cessation of production and the factories have not commenced production operations. As many state governments are contemplating sale of equity in public undertakings, the procedures followed and issues raised in UPSCC and Auto Tractors have many lessons for them.

UP State Cement Corporation

A cement factory owned by the government of Uttar Pradesh was set up at Churk in 1954. Later another factory was set up at Dalla which went into production in 1972. The installed capacity of these two units was 4 8 lakh tonnes and 4 lakh tonnes of cement respectively. In 1972 the ownership of these units, till then operated as departmental undertakings, was transferred to UP State Cement Corporation. The corporation added a clinker factory with a capacity of 8 lakh tonnes and a unit for mixing and grinding slag at Chunar. This unit has the installed capacity to produce 16 8 lakh tonnes of cement.

The objectives of UP State Cement Corporation were:

(i) to produce, store and sell portland cement and other forms of cement, its by-products and building materials,

(ii) to carry out ancillary and supporting activities connected with the growth of cement industry,

(iii) to prospect and promote the raw material requirements of the industry, and

(iv) to undertake expansion of the cement industry in the state and to promote and participate in other industries feeding or depending upon the cement industry.

The total paid-up capital of the corporation has been subscribed to by the state government. The paid-up capital increased from Rs 37 07 crore in 1980-81 to Rs 67 73 crore in 1989 90. The outstanding long-term loans advanced by the state government up to 1988-89 were Rs 5 76 crore. In addition, as on 31 3 90 the instalments due for repayment and accrued interest of loans from financial institutions was Rs 96 crore. In this way the total long-term funds invested in the corporation at the end of 1989-90 were Rs 169 48 crore.

The capacity utilisation of the three plants since 1981-82 is presented in Table 5. The financial position of the company from 1986-87 to 1989-90 is summarised in Table 6. Between 1981-82 and 1989-90 production of cement in Churk declined from 2 87 lakh tonnes to 0 11 lakh tonnes,

in Dalla from 1.20 lakh tonnes to 0.08 lakh tonnes but in Chunar cement production increased from 2.69 lakh tonnes to 9 lakh tonnes. The combined capacity utilisation of the three plants declined from 76.4 per cent in 1981-82 to 35.94 per cent in 1989-90. As a result of indifferent operation of the plants and low capacity utilisation, the cumulative losses of the corporation reached Rs 155.26 crore at the end of 1989-90. The reasons for low capacity utilisation were: Cement manufacturing through wet process has become obsolete. As a result of poor maintenance the incidence of breakdowns increased. There was little effort even to carry out routine and regular maintenance. Supervisory officers complained that even maintenance and operation manuals were not available in the plant offices. Absence of regular maintenance along with low capacity of technical personnel were responsible for frequent breakdowns in the plants. Whenever information of stoppages was collected it was not analysed and as a result no advantage was derived from this information. The Dalla cement factory was operating at low capacity also due to inherent defects in plant design and recurring labour problems. The Chunar plant did not have the required complement of trained technical staff. An illustration of the manner in which the operations of the corporation were carried out is that in 1982 when the clinkerisation plant employing dry process at Dalla was commissioned no composite responsibility was fixed on any supplier of the plant and equipment or the consultant. Even after 10 years of the plant having been commissioned, no composite guarantee tests have been performed. Similar is the case with Chunar cement grinding and packing plant which was also commissioned in 1982. The suppliers have been made full payments but some equipment like cement mills, packing materials, electrostatic precipitators have not functioned at all. Due to these defects the plant's operations have been running at less than half its capacity.

In 1987-88 the management of the corporation noted that the direct cost of production of cement for that year was estimated by Cement Manufacturers' Association at Rs 432 per metric tonne. As against this the cost of production in Dalla/KCCP plants was estimated at Rs 689 per metric tonne as a result of inadequate cost control and lower capacity utilisation (Table 7).

The installed capacity of the corporation at 25.6 lakh tonnes equalled about 50 per cent of cement consumption in the state in 1989-90. As against this the total production by UPSCC was only 9.20 lakh tonnes that year. The corporation also failed in the other objectives of setting up ancillary units, prospecting raw material requirements and promoting industries depending on cement production. Its existence failed to encourage entrepreneurial activity, supplement efforts of private sector or provide effective competition through the private cement industry.

In terms of promoting technology development or generating surplus for further investment in the state, its performance was poor. A high power committee on state enterprises set up by the state government in 1985-86 had recommended that surplus personnel capacity, specially casual labourers and incompetent among technical personnel, should be identified and a scheme for golden handshake prepared. The committee noted that in this task "government will have to give the necessary support in case of labour unrest". Another alternative proposed was to convert the corporation from a fully state-owned undertaking to a joint sector company in collaboration with a large industrial house. It was hoped that the private collaborator would bring in additional funds for modernisation and also bring about a radical change in the culture of the organisation.

Considering the mounting losses in the operations of public enterprises, the state government decided in April 1990 to convert some of the state corporations into joint sector companies by off-loading part of their shares. On May 1, 1990 the state government issued an advertisement in leading newspapers inviting participation in UP State Cement Corporation. In pursuance of the advertisement a meeting was held in the Industries Department of UP with 25 entrepreneurs when some of the important aspects of the proposal were discussed. The state government informed the industrialists that basic parameters to be followed in case of privatisation would be:

(i) UP government will neither make any further investment nor give guarantees to financial institutions against loan;
(ii) retrenchment of workers should not be a pre-condition for any agreement; and
(iii) the relief would be available to UP State Cement Corporation as was applicable to a sick unit as per the policy of the state government and Reserve Bank of India. They were asked to give their offers before the end of June 1990.

In August 1990 the state government set up a committee known as privatisation committee to consider various offers and options including that of:

(i) Giving management contracts to private managers of selected enterprises while retaining state ownership.

Outlays on capital formation	627.75	1441.33	3367.84	3332.4

(ii) Private entrepreneurs may fund the additional capital requirements while the state government may retain majority shareholding.
(iii) Majority shareholding to be transferred to private entrepreneurs and the state to retain minority shareholding.
(iv) Outright sale of the unit.
(v) Closing down of the unit and sale of its assets.

Proposals were invited from private promoters for improving the viability of UP State Cement Corporation. Their proposals could range from taking over the management to purchasing machinery and other assets of the units. Seven parties responded to the state government's invitation. These were:
(i) ACC
(ii) Dalmia Industries
(iii) Modi Cement
(iv) Raymond Woollens
(v) JK Synthetics
(vi) UP Asbestos
(vii) Orient Paper and Industries.

The committee held discussions with the private parties and stipulated parameters according to which proposals were invited from them. The private promoters were informed that the state government would not provide any funds in future to the corporation. All requirement of funds for repair, maintenance, balancing equipment or modernisation would have to be arranged by the promoters. Initially, the state government would be prepared to transfer up to 51 per cent of its shareholding, but all future investment for expansion would have to be provided by the private promoters. The state government would also not stand guarantee for any transaction of UPCC with any bank or financial institution. The state government would, however, assist the promoters in obtaining concessions from the financial institutions as are available to other sick units. The state government would also consider deferring payments of liabilities due to the state government and its agencies. It may also make available sales tax deferment concession as applicable to new industrial units. The chairman will be the nominee of the state government and the MD of the promoters and representation on the board of directors of the corporation will be in the same ratio as the shareholding.

The committee got the value of shares assessed by Billimoria and Company. They prepared their report by drawing UPSCCL's Annual Report (1989-90), audited cost sheets of the company for 1989-90 and April to September 1990 and discussions with company's managers. They did not carry out a physical verification of the plant, machinery, other assets and the liabilities.

According to the valuers, the factories of UPSCC were overmanned. Instead of 4,463 persons employed in these plants only 3,100 were required. It was also found that in addition to employing excess manpower, the corporation was also making substantial payments as overtime to workers. Also, a large number of regular workers neglected their duties and the work was being got done by employing casual labour. When the Chunar unit was commissioned, it was stipulated that the entire surplus staff at Dalla will be transferred first before employing any new workers. However, this could not be accomplished due to the decision of the state government not to shift staff from Dalla. As a result of labour indiscipline, ineffective supervision, political interference, cement production per worker in UPSCCL was only about 0.5-0.6 tonnes as compared to the industry norm of 2.5-3 tonnes per worker. However, in the calculation of fair share value, it was assumed that manpower at current levels would continue to be employed.

On the basis of the technical evaluation of the plants at Churk, Dalla and Chunar, Billimoria assessed that for attaining optimal capacity utilisation investment amounting to Rs 56.53 crore was required immediately. With this investment it was considered feasible to attain maximum/optimal capacity utilisation of 90 per cent in the fourth year.

After replacement and modernisation total sales were expected to increase from Rs 146.98 crore in 1991-92 to Rs 261.61 crore in 1995-96. The operating profits before depreciation and long-term interest were expected to increase from Rs 2.85 crore to Rs 56.70 crore. However, there was substantial interest payment liability on the past loans and unless these were written off or rescheduled, the ability to meet "the repayment schedule as drawn out based on normal concessions and reliefs given by commercial banks and financial institutions will be very difficult unless additional funds of nearly Rs 44 crores are brought in".

The cost of creating 25.6 lakh tonnes of new cement capacity at Rs 1,750 per tonne for wet process, Rs 2,000 per tonne for dry process and Rs 500 per tonne for slag grinding plant was estimated at Rs 364 crore.

The current value of fixed assets of these plants could be estimated on the basis of book depreciation method, balance useful life method and market valuers of assets. The last one was not attempted as the valuers were not able to spend much time at the plant sites. Table 12 gives the current value on

book depreciation method. The valuers did not consider this as a fair indicator of the value of assets as it was neither a fair indicator of the condition of plant and machinery nor of the life of the plant used. After an additional capital investment of Rs 56.33 crore it was expected that the useful life of the plants would be extended as follows.

	(Years)
Churk	15
Dalla	25
Dalla Dry	
Chunar	30

As a new cement plant is estimated to last around 40 years the current value of the fixed assets was computed at Rs 176 62 crore. However, as the capacity utilisation of 90 per cent was expected only after four years the net asset value would be reduced to Rs 139 82 crore

On the basis of capitalisation method assuming a debt-equity ratio of 2 1, average debt service rate of 15 per cent, weighed average depreciation rate of 8 5 per cent, return on equity of 12 per cent and tax rate of 46 per cent, the revalued asset value was estimated at Rs 147 07 crore

On the basis of these calculations Billimoria and Company recommended the fair share value as in Table 15

The committee treated the report of Billimoria and Company as indicative of the strength and weakness of the corporation It did not accept the share value as given by Billimoria and Company as final and held further discussion with private promoters Raymond Woollens conveyed their interest only in purchasing the assets They informed that they were not interested in having a joint venture as they felt that due to high cost of the coal and power and low productivity of labour, the operations of this unit could not be carried on a profitable basis UP Asbestos also did not give a credible offer Only two promoters gave proposals that were pursued by the committee ACC conveyed its interest in purchasing 51 per cent shares over a period of three years It proposed that the management of the corporation should be transferred immediately to it Dalmias also offerd to buy 51 per cent of equity If offered they were willing to hold larger equity in the corporation Both Dalmias and ACC agreed to take over all the employees, though both the parties felt that such a large staff was a drag on the operations of the corporation

The committee asked both the promoters to convey their offers in writing On December 28, 1990 ACC wrote to the state government withdrawing its earlier offers and indicated its disinterest in the matter It stated that "having regard to the large accumulated losses and recurring burden of excessive work-force, it was felt that it will not be possible for the ACC to restructure UPSCCL and run it on a viable basis within the broad parameters of privatisation"

This left only Dalmia Industries in the field. Government of UP and Dalmia Industries then entered into a joint sector agreement in February 1991 in respect of UP Cement Corporation. The important features of the agreement were.

(i) Dalmias will take over the management of UPSCCL Taking over of the assets and liabilities of UPSCCL will be on as is where is basis.

(ii) The state government will hold 49 per cent of equity and Dalmias 51 per cent in UPSCCL.

(iii) The shares with face value of Rs 100 will be transferred by the state government to Dalmias and others at Rs 75 per share

(iv) On entering the agreement Dalmias will pay Rs 5 crore to the state government and the balance amou shall be paid within 24 months whic will carry an interest of 12 per cent p annum from the date of the agreeme till the date it is paid to the sta government The balance amount wi be reinvested by the state governme as secured loan and will carry an intere of 12 per cent per annum. This lo will be repaid after five years in fo equal annual instalments

(v) Whenever the state government decid to disinvest the remaining shar Dalmia and its nominees will have t first right to purchase the shares at mutually agreed price to be fixed that time

(vi) All employees of UPSCCL will taken over by the joint sector ventur

Representation on the board of directors will be in the same ratio as shareholding. State government will have four directors and Dalmias five directors on the board of the corporation. The chairman will be nominated by the state government out of the four directors and the full-time managing director by the Dalmias out of their five nominees.

(vii) The capital base of the corporation will not be changed without prior consultation and agreement of the state government. The state government will not invest any funds other than indicated earlier in UPSCCL. The state government will also not give any guarantee for any funds to be raised in future by the management of UPSCCL. After the joint sector company comes into existence, the state government will grant sales tax deferment facilities for five years. It will also reschedule the liabilities due to the state government and its agencies up to Rs 25 crore. There will be a moratorium on the payment of these liabilities for three years and they will be repaid in five equal annual instalments. The interest payment for these rescheduled liabilities will be 12 per cent with a rebate of 3 per cent for timely and prompt payment. There will be no moratorium on interest payments. The contingent liability of Rs 1.4 crore to sales tax department and Rs 11 lakh towards stamp duty shall be waived. The sales tax department will also drop all pending cases against UPSCCL.

(viii) If Dalmias are not able to meet any of the commitments given to the state government at the time of formation of the joint venture, the state government will be at liberty to take over the management of the company.

The decision to transfer the management of the corporation and to disinvest the shareholding was opposed by employees of the corporation and they launched an agitation against take-over by Dalmias. A petition was filed in the Allahabad High Court and UP government was prohibited from converting UPSCC into a private company. Government of UP transferred 49 per cent of equity in UPSCC to Dalmia Industries with the stipulation that the additional 2 per cent will be transferred after the decision of the court. The government handed over the management of the UPSCC to Dalmias. But as there was labour unrest the factory premises could be transferred only with the help of the police. The police also had to resort to firing to control the labour who were allegedly damaging the corporation's [illegible]y. As a result of the firing nine workers died and production in the cement plant stopped.

The Allahabad High Court in its judgment dated 16.10.90 (Churk Cement Mazdoor Sangh vs State of UP) stated that the normal method of determining compensation is to value the assets, determine the liabilities and find out its net worth. It referred to the observations made by the Supreme Court in R C Cooper vs Union of India (AIR 1970 SC 564 AT 609 to 611):

> The important methods of determination of compensation are (i) market value determined from sales of comparable properties, proximate in time to the date of acquisition, similarly situate, and possessing the same or similar advantages and subject to the same or similar disadvantages. Market value is the price the property may fetch in the open market if sold by a willing seller unaffected by the special needs of a particular purchase; (ii) capitalisation of the net annual profit out of the property at a rate equal in normal cases to the return from silt-edged securities. Ordinarily value of the poperty may be determined by capitalising the net annual value obtainable in the market at the date of the notice of acquisition, (iii) where the property is a house, expenditure likely to be incurred for constructing a similar house, and reduced by the depreciation for the number of years since it was constructed; (iv) principle of reinstatement, where it is satisfactorily established that reinstatement in some other place is bona fide intended, there being no general market for the property for the purpose for which it is devoted (the purpose being a public purpose) and would have continued to be devoted, but for compulsory acquisition. Here compensation will be assessed on the basis of reasonable cost of reinstatement; (v) when the property has outgrown its utility and it is reasonably incapable of economic use, it may be valued as land plus the break-up value of the structure. But the fact that the acquirer does not intend to use the property for which it is used at the time of acquisition and desires to demolish it or use it for other purpose is irrelevant; and (vi) the property to be acquired has ordinarily to be valued as a unit. Normally an aggregate of the value of different components will not be the value of the unit.

These are, however, not the only methods. The method of determining the value of the property by the application of an appropriate

multiplier to the net annual income or profit is a satisfactory method of valuation of lands with buildings, only if the land is fully developed, i e, it has been put to full use legally permissible and economically justifiable, and the income out of the property is the normal commercial and not a controlled return or a return depreciated on account of special circumstances. If the property is not fully developed, or the return is not commercial the method may yield a misleading result.

Compensation to be determined under the Act is for acquisition of the undertaking, but the Act instead of providing for valuing the entire undertaking as a unit provides for determining the value of some only of the components, which constitute the undertaking, and reduced by the liabilities. It also provides different methods of determining compensation in respect of each such component. This method of determination of compensation is prima facie not a method relevant to the determination of compensation for acquisition of the undertaking. Aggregate of the value of components is not necessarily the value of the entirety of a unit of property acquired, especially when the property acquired is a going concern, with an organised business. On that ground alone, acquisition of the undertaking is liable to be declared invalid, for it impairs, the constitutional guarantee for payment of compensation for acquisition of property by law. Even if it be assumed that the aggregate value of the different components will be equal to the value of the undertaking of the named bank as a going concern the principles specified in our judgment do not give a true recompense to the banks for the loss of the undertaking.

It appears clear that in determining the compensation for undertaking—(i) certain important classes of assets are omitted from the heads (a) to (h); (ii) the method specified for valuation of lands and buildings is not relevant to determination of compensation, and the value determined thereby in certain circumstances is illusory as compensation; and (iii) the principle for determination of the aggregate value of liabilities is also irrelevant.

The value determined by excluding important components of the undertaking, such as the goodwill and value of the unexpired period of leases, well not, in out judgment, the compensation for the undertaking."

The court further stated that "though we are not satisfied with the manner in which theg overnment and its agencies have proceeded in the matter, we are of the opinion that before we can pass any final orders in the writ petitions, we should have the net worth of the corporation valued, through a reputed and well known agency". They appointed two audit firms to value the assets and liabilities and determine the net worth of the corporation as on 1.2.1991.

A number of labour unions of employees of Chunar and Churk filed a write petition stating that the interests of workers had already been safeguarded by the specific provisions in the agreement that no worker will be retrenched or the service conditions changed to their detriment. They pleaded that petitions earlier filed by them amy be dismissed.

The events, however, took a dramatic turn as the state government decided to cancel the agreement reached between the government and the Dalmia Industries. The state government resumed the shares transferred to Dalmia Industries *vide* ordinance dated 11.10.1991. The production of klinker and cement in 1991-91-1992-93 in various units of the corporation is given in Table 16. Capacity utilisation and the production of klinker and cement was considerably higher in 1992-93 and 1993-94 as compared to 1991-92. The financial performance of the corporation has however considerably deteriorated in the last two years. Table 17 gives the financial results of the UP State Cement Corporation from 1981-82 with preliminary results for 1992-93 and the projected results for 1993-94. It would be seem that the cumulative losses of the corporation are expected to be about Rs 290 crore at the end of 1993-94. The net worth of the corporation would be Rs 223 crore at that time. The cumulative losses have exceeded the paid-up capital by over four times. The wisdom of the decision to take over the project which is potentially viable but has been incurring continuous losses under state management is, to say the least, extremely doubtful.

II
Auto Tractors

Auto Tractors was established in Pratapgarh, a backward district of UP for manufacturing tractors and diesel engines. The project feasibility report was prepared by HMT which envisaged production of 7,500 28BHP tractors and 2005 diesel engines per year. The estimated cost of the project was Rs 18.86 crore of which the state government was to contribute Rs 7.50 crore and the balance was to be given by the IDBI as term loan. The feasibility report also projected that the undertaking was likely to incur losses in the first three years of its operation, but would start earning cash profits from the fourth year at 67 per cent capacity utilisation. Initially the company was to import more than 80 per cent of components required, but was projected to achieve 100 per cent indigenisation within three years of the beginning of commercial production. The company entered into a technical collaboration agreement with Leyland Motors in 1979 and started manufacturing

tractors from October 1981 Due to price escalation, as against the estimated cost of Rs 18 86 crore, the actual project cost increased to Rs 26 32 crore

The operations of the undertaking have been facing technical and financial difficulties from its inception Table 17 summarises the production targets, actual production, sale and cost of production per tractor/engine since 1981-82

Till 1989-90, 2,380 tractors were manufactured by the corporation This was less than the production target set for the first two years of its operation As against the expectation of cash profit from fourth year of the commencement of the production, cash losses continued to mount They were met by the state government by advancing loans to the corporation Some of the factors responsible for the poor performance of the corporation where

(i) Inappropriate choice of technology Leyland who provided the technical know-how had discontinued the production of 28 BHP tractors in 1972 ATL were, therefore, in no position to incorporate in their design advances made in technology and changes in consumer preferences By the mid-1970s tractors were being used in agricultural operations as well as for transporting men and materials The tractors manufactured by ATL were not suitable for such multi-purpose use These tractors had certain obsolete features like mechanical draft control system, low weight sheet, small size and low lifting capacity Consumer preference, however, was for big size and heavyweight tractors Before or after entering into the technical collaboration agreement no survey of farmers' preference was made and, as the collaborator had ceased manufacturing this model, market testing could not be done

(ii) The project report made unrealistic assumptions about demand projections and the speed with which indigenisation could take place The corporation was manufacturing only 50-55 components of the 900 parts in a tractor The rest were being procured from various vendors Co-ordinating the procurement of parts from such a large number of sources was a complex operation The fact that the technical collaborator had ceased manufacturing the model compounded the difficulties Components that were not available indigenously also could not be imported for this reason

(iii) The established installed capacity of tractor manufacturing units in the country in 1989 was 1,40,000 Production of tractors increased from 85,500 in 1984-85 to about 1,70,000 in 1989 and in that year about 1,00,000 tractors were sold The highest production achieved by ATL was 721 tractors in 1983-84 as against the annual production of 6,000 envisaged in the project report At such a low level of production it was not possible for ATL to successfully compete with the already established models, provide adequate after sales service or launch successfully a credible marketing campaign

(iv) As production was heavily dependent on procurement from different vendors, the location of ATL in a backward district with inadequate communication difficulties added to the list of drawbacks faced by the company Also the demand for components being very small, the suppliers did not give priority to the orders placed by ATL

The assumption of 100 per cent indigenisation in three years was highly impractical Even where technical collaborators actively supported the production programme, such a high level of indigenisation has not been achieved In this case the technical collaborator did not supply even the basic drawings and process sheets required for the development of an indigenisation programme, specially of proprietary items

Therefore, production continued to depend on imported components

As against the estimated cost of Rs 18 86 crore, the actual cost at which the project was set up was Rs 26 32 crore which was higher by about 39 per cent than the original estimate The capital structure, long-term loan by the state government and from other sources, short-term loan and cumulative cash losses at the end of 1989-90 are given in Table 19

The operations of ATL have been examined by several expert committees They recommended that the corporation could not be viable by manufacturing 28 BHP Leyland Tractors and diesel engines The state government also examined the possibility of manufacturing three-wheeler vehicles in this plant But considering intense competition and lack of expertise, it was decided not to venture in this field As it became evident that it would not be possible to operate the unit profitably, it was decided in November 1990 to close down the operations All the employees numbering about 1,230 were paid compensation and were retrenched The state government appointed a committee to recommend various options regarding the disposal of the assets of ATL The committee appointed a firm of chartered accountants

who were also auditors of ATL to value the assets. The chartered accountants assessed the value of assets at Rs 8.8 crore. In their view if there was a change in product line, the value of plant and machinery would be even lower. The committee invited offers from private promoters for operating the plant in joint sector. Five private promoters responded to the proposal and expressed interest in taking over the assets. They were: (i) Raunaq Industries, (ii) Kanoria Industries, (iii) P Patel Industries, (iv) Essar Industries, (v) Sipani Automobiles.

On the basis of discussions with all the parties, the committee determined that except Sipani Automobiles, others were interested only in buying the machinery. Sipani, on the other hand, intended to operate the plant and manufacture automobile engines. The committee, therefore, recommended that an agreement to convert ATL into joint sector may be entered into with Sipani Automobiles. The main provisions of the joint venture agreement dated 19.3.1991 which was approved by the government were:

(i) ATL will be converted into a joint sector enterprise. The state government will reduce its shareholding to 26 per cent and transfer 25 per cent of shares to Sipani Automobiles. The balance 49 per cent will be sold to public.

(ii) Sipani will pay Rs 5.55 crore in consideration for 74 per cent equity. They will retain 25 per cent of the 75 lakh shares and sell 49 per cent shares to dealers and public. Of Rs 5.55 crore to be paid by the private promoter, Rs 3.8 crore will be paid within 4-6 months and the balance Rs 1.7 crore within 12 months of the date of the agreement.

(iii) The state government will reinvest Rs 4.55 crore as secured loan and pay interest at 12 per cent per annum. The principal will be repaid in five annual instalments after a moratorium of three years.

(iv) ATL will prepare a balance-sheet as on 31.3.91 showing the liabilities of the company and the state government will assume all repayment liabilities of loans/interest except the liabilities on account of working capital up to Rs 2.30 crore. The state government will also bear all dues of sales tax, central excise, municipal/panchayat taxes and electricity dues on the date of the agreement.

(v) There will be no further inflow of funds from the state government to ATL in future. The state government will also not give any guarantee for any funds to be raised in future by ATL.

(vi) Sipani Automobiles will operate ATL for a minimum period of nine years or till they repay all the dues to the government.

(vii) SAL and ATL will engage workers at their discretion. SAL agreed to re-employ about 600-700 employees within one year of the date of signing of the agreement and increase it to 1,000. However, SAL and ATL shall have exclusive right to employ any personnel of their choice for running the unit.

(viii) The possession of the factory was handed over to SAL on 21.3.1991. On a writ petition filed by UP Engineers Association Auto Tractors Unit, Pratapgarh, the Allahabad High Court passed a stay order on 29.3.1991 prohibiting the state government and SAL to enter into any transaction, but vacated this on 11.04.1991. Since take over, Sipani have concentrated on the production of engines. In 1991-92 and 1992-93 a total of 1,249 and 1,541 engines were manufactured as compared to 273 in 1988-89 and 267 in 1989-90. In 1993-94 till December 93, 630 engines and 10 tractors were manufactured in the plant. More dramatic has been the financial turn around of the company. In 1991-92 it earned a net profit of Rs 26.26 lakh, in 1991-92 of 12.65 lakh and up to December 1993, it had earned Rs 10.25 lakh. This is in refreshing contrast to the annual loss of Rs 8 to 10 crore during 1988-89.

It is apparent that the impulse to bring about a change in ownership and managerial organisation of the two undertakings was because of large losses incurred by them over a number of years. In both the cases there were problems in the choice of technology and location, and failure of the managements to provide credible leadership, interference by the state government and inability of the enterprises to raise sufficient resources for fresh investment. These enterprises are located in backward districts and posting as chief executive of these units was not considered an important position for senior civil servants. The result was that most of the time civil servants posted to these organisations were trying to get out. Politicians used these enterprises as a source of patronage to enhance their influence by distributing jobs and favours. In this way they were seeking to maximise their influence rather than improve the productivity and performance of the enterprise. The interest of the corporations was far removed from their mind. With indifferent leadership provided by the management, many officials of the corporation are reported to have developed business interest in these enterprises. In this way politicians, executives as well as workers' leaders benefited from these enterprises. The loser was the state exchequer which continued to support these units by meeting their cash requirements.

Having decided that it was no longer viable to operate UPSCC and ATL as state enterprises, the state government did not adopt a uniform approach to divesting ownership of these enterprises. In case of ATL, the government closed down the unit, gave labour and management terminal benefits and then started looked for options to dispose of the assets. In implementing this decision they were fully supported by the board of directors of ATL. In case of UPSCC the plants continued to operate, while the options for transfer of state government shares were being discussed. Some nominees of the state government on the board of directors of UPSCC were not committed to the idea of privatisation. Many of them were reported to have cast doubt on the appropriateness of this decision. They felt that the operations of the corporation could be improved and there was no need to divest state ownership. This situation could have been corrected if the board of directors of the corporation was reconstituted with those who were committed to support such a decision. Also the key officials of the corporation were not closely associated in the discussions for considering different modes or the terms on which state government shares were transferred. No consultation was held with workers' representatives at any stage. Their views were not invited either on the reasons for losses suffered by the corporation or on the mode of privatisation. This created an apprehension that the government was unmindful of workers' interests. The transfer of management to Dalmias had to be effected with police assistance. This was done just before the assembly elections and the haste with which the operations were concluded and the manner of takeover by the private promoters created the impression that undue favours were being shown to them.

In case of UPSCC agreement was reached with Dalmias that they would acquire 51 per cent shareholding in UPSCC. However, in view of the court order prohibiting sale of assets of UPSCC, 49 per cent shares with book value of Rs 33.45 crore were transferred to them. At 75 per cent the value of these shares was assessed at Rs 25.09 crore. Dalmia paid Rs 5 crore in cash. The balance of Rs 20.09 crore was to be paid within 24 months. This cash was not to accrue to the state exchequer but was to be reinvested as loan to UPSCC to be repaid over nine years. The loans extended by the state government and liabilities of the state agencies were limited to Rs 25 crore. These were to be repaid over eight years period. The state government also agreed to write off sales tax liability of Rs 1.14 crore and stamp duty of Rs 11 lakh. On the outstanding loans to the financial institutions amounting to about Rs 100 crore, no commitment was given by the state government and the liability of the corporation would continue.

In case of ATL state government's contribution was Rs 7.50 crore. In addition it had extended long-term loan of Rs 5.13 crore and Rs 27.41 crore to meet cash losses. Sipani agreed to pay Rs 5.55 crore of which Rs 4.5 crore was to be reinvested by the state government over a period of eight years. The state government transferred ATL for Rs 1 crore of cash and Rs 4.55 crore as loan. Unlike in case of UPSCC the state government agreed to take over all dues of sales tax, excise, electricity dues, etc.

Another major difference in the two agreements was with regard to the liability towards workers. In case of UPSCC, the government had insisted that all the workers would have to be employed by the new management, but in ATL Sipani made it clear that while preference would be given to erstwhile ATL employees they would employ only as many workers as was considered necessary by them.

As already mentioned in case of ATL, the government decided to close down the factory and pay the workers retrenchment compensation. One may ask why this was not adopted in case of UPSCCL. One reason could be that compensation payment in case of ATL was established at about Rs 5 crore only, while in case of UPSCCL it would have been about Rs 50 crore. Such a large commitment of funds would have deterred the state government from this option.

III
Some Lessons

A few lessons emerge from this review. First, there are many obstacles to privatisation like developing a coherent strategy, choosing enterprises, valuation of assets, finding credible entrepreneurs capable of successfully running the enterprises. Second, there is need for transparency in the privatisation process. There is a danger of this being overlooked in the interest of speed. But if the consideration of alternative modes of privatisation, valuation of assets, selection of new owners are open, the potential for allegation of irregularities, collusion of corruption would be less. If some special concessions are to be granted to the owners, it is even more important that the process is transparent. Third, loss-making enterprises are likely to attract few private promoters. This may be due to an apprehension that even after divesting ownership the government had decided as to whom it would prefer to sell its shareholding and the exercise of selection was only a formality. In both UPSCC and ATL although a number of business groups showed interest to take over, they dropped out and only one group was left in both the cases. Fourth, even in advanced countries with sophisticated financial markets, it is difficult to determine the market value of the assets of loss-making enterprises. After years of neglecting investment and inadequate maintenance it may not be easy to reach a universally acceptable estimate of value of assets. In developing countries, this task is even more difficult. In order to assess their value, all assets of the unit proposed to be privatised should be catalogued. Once a list of plant and machinery is prepared, it should be valued at realistic market prices. Since expertise for this type of work is not likely to be available in the government, this task could be assigned to professional appraisers. In case of UPSCC no such catalogue of assets was prepared. Billimoria and Company estimated the value of assets mainly on the basis of annual reports and audited balance sheets of the corporation. This led to complaints that assets were undervalued and undue favours were shown to Dalmias. Fifth, there is a strong inertia to changing the system. The opposition to change comes from the managers of such enterprises, civil servants, workers as well as politicians. The management would like to keep the enterprise in public sector regardless of its performance. Sixth, it requires imagination and drive to implement the divesture of state ownership. In fact, besides the finance departments, there may be very few supporters of privatisation in the government. Opinion, therefore, should be created to support the process. For this it would be necessary to demonstrate gains to the economy by the state transferring the ownership of enterprises. Seventh, in the privatisation process workers should invariably be consulted. Workers feel that the decision to divest state ownership is taken primarily to reduce their number. They will be the only losers and would have to bear the burden of rationalisation and adjustment cost. This is so unless they feel that the decisions are equitable and they are not being unfairly treated. Eight, it may be better to close down the unit, give labour their leigitimate compensation and then proceed with the transfer of ownership to private groups. Governments are generally unwilling to close down the enterprises they own. However, in cases where surplus workers are in large numbers and their leadership unable to reach a settlement, this may be the only viable option. In case of ATL, government reached the conclusion that the business of the corporation could not be carried on profitably. It, therefore, shut down the operations. The transfer of ownership did not create opposition even though in this case the new owners decided to re-employ only half the number of erstwhile employees of ATL. Lastly, the transfer of ownership of large enterprises is not a routine decision. It can be implemented successfully in a stable political environment and when there is no doubt about government's fairness. When elections are about to be held, it would be best to postpone decisions on such issues.

Role of Design and Informal Share Markets in Success of Sugar Co-operatives

R Rajagopalan
Tushaar Shah

Why have sugar co-operatives done so outstandingly well in south Gujarat and Maharashtra? Central to their success are three important features of their design which enable the interests of thousands of cane growers to coalesce into a powerful member organisation, which operates as an engine of wealth generation for its members and remains member oriented through a patronage cohesive governance structure. A major institution that supports patronage cohesive governance is the informal and yet dynamic market in the shares of these co-operatives in south Gujarat. The prices these shares command are important to their owners as (a) a form of wealth, (b) a performance index, and (c) an instrument of member control. As a robust if imperfect summary index of management performance on which information is available widely and openly, this market price of the co operative's share encourages the board and management to continually search for and adopt member-oriented policies.

I
Introduction

SOUTH Gujarat has a long tradition of successful entrepreneurship and of co-operative institutions. The co-operative movement began in the early years of the century with the establishment of the Surat District Co-operative Bank which was followed by the setting up of the several different types of urban as well as rural co-operatives. Early rural co-operatives dealt a lot in the ginning and pressing of cotton which was the mainstay of the area's agriculture up until mid 1970s when repeated pest attacks in cotton and the completion of the Ukai Kakrapar irrigation project combined to marginalise cotton cultivation and raise the profile of sugar-cane in the economy of the area. The successful Bardoli Co-operative Sugar Factory set up in 1957 had already introduced a new dynamics in the agricultural economy of south Gujarat, however, this did not work itself out fully until cotton became more-or-less extinct. The virtual explosion of co-operative sugar factories consequent to the Ukai-Kakrapar Canal Project, has dramatically transformed the agricultural economy of the region.

By 1991 Surat and Bulsar districts had 10 out of 14 sugar factories in Gujarat all owned by producer co-operatives, with a total crushing capacity of 60 lakh mt of sugar-cane per year, several new co-operative factories were under implementation and the government of Gujarat had decided to license 10 more sugar co-operatives. At an average yield of around 100 mt/ha, these co-operative factories in south Gujarat process the produce of roughly 60,000 ha of cane area. And at an average price of Rs 475/ mt, these co-operatives pump in approximately Rs 300 crore/year into the hands of their member-farmers, of which roughly Rs 150 crore is the surplus net of cash costs. By all accounts, sugar cane farming has made the villages highly prosperous. It has also engendered greater relative disparities in rural incomes.

A typical sugar co-operative plays a central role in the local economy and its members' lives. Unlike most Indian co operatives, a sugar co-operative in south Gujarat is completely member controlled—in *de jure* as well as *de facto* terms—with virtually no government interference and a relatively low profile of professional and technical staff who are firmly under the control of their elected boards. The technology of sugar manufacture and the perishability and seasonality of cane production, constrains the co-operative to restrict cane supplies of its members and compels it to enforce a rigorous time schedule. It dovetails members' cane farming operations and the factory's processing requirements through a tight regimen making the relationship very similar to contract farming. Members fall in line and accept this regimen because, with the help of the co-operative factory, sugar-cane has become the most profitable crop with virtually no price risk. Co-operatives also help farmers to simultaneously minimise yield risks with the help of such centralised activities as varietal selection, seed treatment, aerial spraying of pesticides, co-ordinated harvesting and transport.

We have sugar co-operatives done so outstandingly well in south Gujarat is a question many have tried to answer. Many have attributed their high performance to socio-economic and cultural characteristics of the region: erstwhile progressive rulers in the Gaikwads of Baroda, being the oldest base in India of the East India Company, priority given to commerce and economic growth by the people and so on. Finally, the area had communities like patidars, anavil brahmins and others which provided the leadership and entrepreneurial resources needed to establish and run co-operatives.

In exploring the same question, Attwoo and Baviskar (1987) compared the poo performance of the private sector suga mills and the co-operative cane suppl unions of north India with the successfu Maharashtra sugar co-operatives. The identified the cane supply relationshi developed by the Maharashtra co operatives as the critical distinguishin feature of their success. They pointed ou that for obtaining adequate cane supplie on a schedule which is critical for th viability of the co-operative, large farmer controlling the co-operatives have struck stable alliance with small and mediur farmers. This pragmatic alliance wa facilitated by the agrarian system of the regio with relatively loose social stratificatior These authors also showed that the politica structures evolved by sugar co-operative facilitated more direct and functional membe control on their management throug patronage cohesive[1] governance.

Attwood and Baviskar used, in additio to direct observation, the share holdin records of sugar co-operatives to draw thei inferences. Our fieldwork and discussion with members, leaders and functionaries o several sugar co operatives in south Gujara too supported their broad conclusion: However, we also learnt that a range c formal and informal mechanisms used t perpetuate the domination of large farme in the governance and management of co operatives accounted for the vigour an vitality of these organisations. Among them, we found two whose significanc has not been fully recognised in existin research: the political structures an processes evolved and used by sugar co operatives, and the informal but activ markets for the shares of these co operatives. We discuss these powerfu institutions and their decisive impact o the governance and management of suga co-operatives in this paper.

II
Operating System of Sugar Co-operative

India is perhaps the only country where cane is cultivated by independent farmers and not on factory-owned farm estates. But in south Gujarat, planting as well as harvesting are nevertheless closely co-ordinated by the sugar co-operatives. At one level, this co-ordination imposes a tight regimen and discipline on farmers; but on the other, by taking over several laborious operations such as harvesting and transport, spraying of pesticides, etc, co-operatives have also made cane farming easy for their members. We sketch below the logistics of the Chalthan Co-operative Sugar Factory's operation.
